# REGISTRATIONS PUBLISHED UNDER SEC. 12(c)

The following marks registered under the act of 1905, or the act of 1881, are published under the provisions of section 12(c) of the Trademark Act of 1946. These registrations are not subject to opposition but are subject to cancellation under section 14 of the act of 1946.

## CLASS 5

### ADHESIVES

153,975. Apr. 4, 1922. Bauer & Black, Chicago, Ill. Pub. by The Kendall Company, Boston, Mass.

Tirro

For Adhesive Tape.

## CLASS 13

### HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

381,403. Sept. 24, 1940. West Bend Aluminum Co., West Bend, Wis. Pub. by registrant.

Laurel
ALUMINUM WARE

The notation "Aluminum Ware" is disclaimed apart from the mark.

For Aluminum Cooking Hollow Ware.

## CLASS 21

## ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

427,940. Mar. 4, 1947. H. A. Douglas M'f'g Co., Bronson, Mich. Pub. by Kingston Products Corporation, Kokomo, Ind.

HAD

For Electric Connectors, Electric Terminals, Electric Connecting Plugs, Electric Sockets, Electric Wiring Outfits, Dash Incandescent Lamps, Electric Cowl Lamps, Electric Inspection Lamps, Electric Switches, Electric Headlights, Electric Spark Plugs, and Electric Spotlights.

## CLASS 23

## CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

405,504. Feb. 8, 1944. The Accurate Bushing Company, Garwood, N. J. Pub. by Accurate Bushing Company, Garwood, N. J.

ABC

For Drill Jig Bushings and Liners Therefor.

## CLASS 27

## HOROLOGICAL INSTRUMENTS

338,062. Aug. 25, 1936. Western Clock Company, Peru, Ill. Pub. by General Time Corporation, La Salle, Ill.

TRAVALARM

For Clocks.

338,301. Sept. 1, 1936. Western Clock Company, Peru, Ill. Pub. by General Time Corporation, La Salle, Ill.

Fortune

For Clocks.

## CLASS 30

## CROCKERY, EARTHENWARE, AND PORCELAIN

113,898. Nov. 7, 1916. National X-Ray Reflector Company, Chicago, Ill. Pub. by Curtis Lighting, Inc., Chicago, Ill.

X-RAY

For Porcelain Reflectors for Lighting Fixtures.

## CLASS 36

## MUSICAL INSTRUMENTS AND SUPPLIES

443,580. Nov. 29, 1949. Societe Anonyme des Anciens Etablissements, Martin Freres, Paris, France. Pub. by Societe Anonyme des Anciens Etablissements, Martin Freres, Paris, France.

MARTIN Freres

For Woodwind Musical Instruments—Namely, Clarinets, Oboes and Bassoons, and Reeds Therefor.

U. S. GOVERNMENT PRINTING OFFICE: 0——1956

OFFICIAL GAZETTE • UNITED STATES PATENT OFFICE
December 4, 1956 Volume 713 Number 1

# PATENTS

## NOTICES

### Erratum

All references to Patent No. 2,771,310 to John A. Royer, William S. Kimbro, and Harry D. Jacoby, assignors to Buckner Manufacturing Company, Inc., for Rotary Sprinkler Swivel With Thrust Bearing Assembly, appearing in the OFFICIAL GAZETTE of November 20, 1956, should be deleted as the application was withdrawn from issue and the patent was not issued.

### Adjudicated Patents

(C. A. N. Y.) Magnus Patent No. 2,373,129 (84—377) for plastic harmonica reed plate with integral reeds, *Held* invalid. *Magnus Harmonica Corp.* v. *Lapin Products, Inc.*, 236 F.2d 285; — USPQ —.

(C. A. N. Y.) Magnus Patent No. 2,407,312 (84—377) for plastic harmonica reed stick assembled with a plastic reed plate, *Held* invalid. *Id.*

(C. A. N. Y.) Wentworth Patent No. 2,496,969 (88—41) for spectacle sweat bar, *Held* invalid. *Welsh Mfg., Co.* v. *Sunware Products Co.*, 236 F.2d 225; 110 USPQ 161.

### Disclaimer

2,708,916.—*John H. Davids*, Beloit, Wis. FUEL CONTROL SYSTEM FOR INTERNAL COMBUSTION ENGINES. Patent dated May 24, 1955. Disclaimer filed Oct. 29, 1956, by the assignee, *Fairbanks, Morse & Co.*

Hereby enters this disclaimer to claims 4, 5, 6, 7, 9, 10, 12, and 13 of said patent.

### Patents Available for Licensing or Sale

2,691,720. Wall and Ceiling Light Transmitting Means. Elwyn L. Simmons, % Cromwell, Greist & Warden, Room 1617, 38 South Dearborn St., Chicago 3, Ill.

2,742,058. Loom. Augusto Gentilini, Via Malpensata 12, Lecco, Italy. Correspondence to Michael S. Striker, 511 Fifth Ave., New York 17, N. Y.

2,753,156. Portable Snow Fence. Hans Rieger, Friedenheimer Str. 126, Munich 42, Germany. Correspondence to Michael S. Striker, 511 Fifth Ave., New York 17, N. Y.

2,768,624. Hygienic Sanitary Fountain. Joseph C. Lamb, 36 East Commerce St., Bridgeton, N. J.

General Electric Company is prepared to grant non-exclusive licenses on reasonable terms under the following patents to domestic manufacturers.

Applications for licenses under the following patent may be addressed to: General Electric Company, Patent Counsel, Chemical and Metallurgical Division, 1 River Road, Schenectady 5, N. Y.

2,757,152. Water-Repellent Compositions Comprising a Polysiloxane, a Urea- or Melamine-Formaldehyde Resin and a Curing Agent.

Under the following 25 patents non-exclusive licenses will be granted in the field of radio purposes.

Applications for licenses may be addressed to: Patent Counsel, Defense Electronics Division, General Electric Company, Syracuse, N. Y.

2,548,635. Monitor for Amplitude Modulated Signals.
2,566,981. Low-Distortion Oscillator.
2,728,881. Asymmetrically Conductive Devices.
2,731,423. Electro-Luminescent Materials and Method of Preparation.
2,741,686. Electric Resistor.
2,742,617. Tunable Cavity Resonator.
2,745,910. High Frequency Electric Discharge Device Coupling Apparatus.
2,747,031. Magnetron Amplifier.
2,747,084. High Frequency Electrical Systems Having High Input Impedance.
2,747,087. Electric Discharge Device and High Frequency Systems Therefor.
2,747,137. High Frequency Electrical Apparatus.
2,748,303. High Frequency Power Amplifier.
2,748,279. Magnetron Amplifier.
2,748,280. Magnetron Amplifier.
2,748,307. Magnetically Focused Electron Discharge Device.
2,748,354. Wide Band TV Tuning Circuit.
2,751,555. Extended-Range Phase Comparator.
2,756,396. Wave Guide Attenuator.
2,757,323. Full Wave Asymmetrical Semi-Conductor.
2,760,070. Amplitude Stabilized Transistor Oscillator Circuit.
2,761,061. Broadband Balanced Mixer.
2,763,233. Automatic Machine for Coating Cathode Ray Tube Bulbs.
2,763,432. Electronic Counter Indicator.
2,763,564. Means and Methods for Processing Cathode Ray Tube Bulbs.
2,763,565. Means and Methods for Processing Cathode Ray Tube Bulbs.

### New Applications Received During October 1956

| | |
|---|---|
| Patents | 6,722 |
| Designs | 473 |
| Plants | 9 |
| Reissues | 21 |
| Total | 7,225 |

### Issue

| | | |
|---|---|---|
| Patents | 843—No. | 2,773,415 to No. 2,773,257, incl. |
| Designs | 30—No. | 179,236 to No. 179,265, incl. |
| Plants | 2—No. | 1,532 to No. 1,533, incl. |
| Reissues | 11—No. | 24,242 to No. 24,252, incl. |
| Total | 886 | |

CONDITION OF PATENT APPLICATIONS AS OF OCTOBER 31, 1956

# CONDITION OF PATENT APPLICATIONS AS OF OCTOBER 31, 1956

| | |
|---|---|
| Total number of pending applications (excluding Designs) | 217,058 |
| Total number of pending Design applications | 6,831 |
| Total number of applications awaiting action (excluding Designs) | 117,257 |
| Total number of Design applications awaiting action | 2,972 |
| Date of oldest new application | June 27, 1955 |
| Date of oldest amended application | June 18, 1954 |

ROSA, M. C., Director, Patent Examining Operation

| PATENT EXAMINING GROUPS, AND SUPERVISORY EXAMINERS | DIVISIONS |
|---|---|
| I. STONE, I. G., CHEMICAL AND RELATED ARTS | 6, 21, 26, 42, 45, 80, 85, 86, 60, 62, 64. |
| II. STRACHAN, O. W., COMMUNICATIONS, RADIANT ENERGY AND ELECTRICAL ARTS | 16, 28, 28, 37, 43, 44, 48, 51, 54, 69, 70. |
| III. YUNG KWAI, B., MECHANICAL MANUFACTURING, MACHINE ELEMENTS AND DESIGNS | 2, 12, 13, 14, 21, 24, 57, 58, 61, Designs. |
| IV. FREEHOF, H. B., MATERIAL HANDLING AND TREATING, OPTICS, RAILWAYS AND AMUSEMENT DEVICES. | 7, 11, 17, 27, 34, 35, 36, 52, 63. |
| V. HULL, J. S., STATIC STRUCTURES AND INSTRUMENTS OF PRECISION | 8, 20, 29, 33, 38, 40, 41, 53, 65. |
| VI. MURPHY, T. F., AGRICULTURE, TRANSPORTATION, PUMPS AND MOTORS | 1, 4, 5, 9, 10, 15, 22, 23, 45, 47. |
| VII. KAUFFMAN, H. E., HEATING AND COOLING, PLASTIC SHAPING AND COATING, SEPARATION AND MIXING, BODY TREATMENT AND CARE. | 3, 15, 19, 25, 30, 32, 49, 55, 67. |
| CL. GORECKI, G. A., ARTS UNDERGOING RECLASSIFICATION AS LISTED UNDER CLASSIFICATION DIVISIONS. | I, II, III, IV, V. |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Amended |
|---|---|---|
| 1. (VI) GOLDBERG, A. J., Brakes; Excavating; Planting; Plant Husbandry; Scattering Unloaders | 11- 9-55 | 1- 3-55 |
| 2. (III) HERRMANN, D., Fishing, Trapping and Vermin Destroying; Presses; Tobacco; Textile Wringers | 2- 6-56 | 8- 2-55 |
| 3. (VII) LE ROY, C. A., Metal Founding and Treatment; Metallurgy (Process and Apparatus); Alloys | 3-19-56 | 1-14-55 |
| 4. (VI) FALLER, E. A., Hoists; Power Driven Conveyors; Handling Apparatus; Elevators; Feeding of Indefinite Lengths | 2- 1-56 | 2-10-55 |
| 5. (VI) ROBINSON, C. W., Harvesters; Potato Diggers; Stalk Pullers and Choppers; Stone Gatherers; Threshing; Knotters; Animal Husbandry; Bee Culture; Dairy; Butchering; Vegetable and Meat Cutters and Comminutors; Fences; Gates | 2- 6-56 | 7- 5-55 |
| 6. (I) SURLE, H., Carbon Chemistry (part), e. g. Natural Resins, Proteins, Heterocyclic Amides, Amines, General Organic Processes | 7-20-55 | 5-10-55 |
| 7. (IV) GONSALVES, J. E., Optics, Photographic Apparatus | 12-22-55 | 2-21-55 |
| 8. (V) LEWIS, R. O., Beds; Chairs and Seats; Cabinets; Tables; Miscellaneous Furniture | 9-23-55 | 1- 5-55 |
| 9. (VI) BRANSON, J. H., Pumps; Fans; Turbines | 2- 1-56 | 2-14-55 |
| 10. (VI) BOYD, S., Firearms; Ordnance; Ammunition; Explosive Charge Making | 10-26-55 | 1-20-55 |
| 11. (IV) BENHAM, E. V., Boots, Shoes and Leggings; Shoe and Leather Manufacture; Button, Eyelet and Rivet Setting; Nailing, Stapling and Clip Clenching; Card, Picture and Sign Exhibiting; Cutlery; Cleaning and Liquid Treatment of Solids | 1- 3-56 | 2-10-55 |
| 12. (III) SPINTMAN, S., Machine Elements; Engine Starters; Interrelated Clutch and Motor Controls | 10-11-55 | 9-16-54 |
| 13. (III) BEALL, T. E., Gear Cutting; Electric Lamp and Tube Manufacture; Needle and Pin Making; Metal Working (part), e. g. Special Work, Forging, Plastic Working, Drawing, Sawing, Milling, Planing, Turning | 1-10-56 | 11-22-54 |
| 14. (III) MANIAN, J. C., Metal Working (part), e. g. Sheet Metal, Wire Bending, Miscellaneous Processes, Assembly and Disassembly Apparatus; Wire Fabrics; Air Brakes | 11-14-55 | 11-16-54 |
| 15. (VII) BRINDISI, M. V., Plastics; Plastic Block and Earthenware Apparatus; Glass | 2- 1-56 | 12- 6-54 |
| 16. (II) LOVEWELL, N. N., Television; Telephony; Recorders | 10-19-55 | 8-30-54 |
| 17. (IV) LEIGHEY, R. A., Paper Manufacture; Packaging; Typewriters; Printing; Type Casting and Setting; Sheet Material Association or Folding; Sheet or Web Feeding | 12-15-55 | 1-17-55 |
| 18. (VI) BLUM, A., Power Plants; Fluid Transmissions; Servomotor Systems; Jet Motors; Combustion Turbines; Speed Responsive Devices | 12-19-55 | 12- 8-54 |
| 19. (VII) PATRICK, P. L., Stoves and Furnaces; Boilers; Concentrating Evaporators; Fluid Fuel Burners | 1- 5-56 | 4-20-55 |
| 20. (V) BROWN, L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Safes; Bank Protection; Bread, Pastry and Confection Making; Tents and Canopies; Umbrellas; Canes; Undertaking | 3-20-56 | 2-10-55 |
| 21. (III) MADER, R. C., Textiles | 1-26-56 | 1-26-55 |
| 22. (VI) MARLAND, M. L., Aeronautics; Boats; Buoys; Ships; Marine Propulsion; Propellers; Windmills; Fluid Diaphragms and Bellows; Boring and Drilling | 12-27-55 | 12- 6-54 |
| 23. (II) ANDRUS, L. M., Cash and Fare Registers; Calculators and Counters; Education | 8-23-55 | 7-16-54 |
| 24. (III) DRACOPOULOS, P. T. (HICKEY, T. J., acting), Apparel (except Corsets and Brassieres); Apparel Apparatus; Sewing Machines; Textiles, Ironing or Smoothing; Clutches and Power-Stop Control | 2- 9-56 | 2- 2-55 |
| 25. (VII) NEVIUS, R. D., Coating—Processes, Miscellaneous Products and Apparatus; Distillation; Wood Treating Apparatus | 1- 3-56 | 8- 9-55 |
| 26. (II) YOUNG, R. R., Electricity—Generation, Motive Power, Transmission Systems, Voltage and Phase Control Systems, Furnaces, Battery Charging and Discharging, Arc Lamps, Prime Mover Dynamo Plants; Elevators (part), e. g. Miscellaneous Electric Control Mechanism | 3- 5-56 | 9- 2-55 |
| 27. (IV) JAMES, S., Brushing, Scrubbing and General Cleaning; Brush, Broom and Mop Making | 2- 1-56 | 3-29-55 |
| 28. (VI) BRAUNER, R. H., Internal Combustion Engines; Expansible Chamber Motors; Fluid Servomotors; Spring, Weight and Animal Powered Motors; Cylinders; Pistons; Drive Shafts; Flexible-Shaft Couplings; Chucks or Sockets; Chain, Skid, Guide and Way Conveyors; Fluid Current Conveyors; Pressure Modulating Relays; Pneumatic Dispatch; Store Service; Wheel Substitutes | 10-24-55 | 2-21-55 |
| 29. (V) HABECKER, L. B., Tools; Woodworking; Button, Barrel and Wheel Making; Rubber Tire Removing Tools; Washing Machines; Baggage; Cloth, Leather and Rubber Receptacles; Package and Article Carriers | 12- 2-55 | 11-26-55 |
| 30. (VII) O'LEARY, R. A., Refrigeration; Heating Systems; Automatic Temperature and Humidity Regulation, Thermostats, Humidistats; Illuminating Burners; Miscellaneous Heating | 5- 2-56 | 7- 8-55 |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Amended |
|---|---|---|
| 31. (I) HUTCHISON, E. W., Carbon Chemistry (part), e. g. Urea Adducts, Silicon Containing Carbon Compounds, Hydrogenation of Carbon Oxides, Partial Oxidation of Non-Aromatic Hydrocarbon Mixtures, Hydrocarbons, Halogenated Hydrocarbons | 12-28-55 | 11-17-55 |
| 32. (VII) BERMAN, H., Gas and Liquid Contact Apparatus; Heat Exchange; Gas Separation; Agitation; Self Proportioning Fluid Systems; Liquid Level Responsive Systems; Fire Extinguishers | 2-15-56 | 8- 1-55 |
| 33. (V) MUSHAKE, W. L., Bridges; Hydraulic and Earth Engineering; Building Structures; Roads and Pavements | 2- 1-56 | 12- 3-54 |
| 34. (IV) SAPERSTEIN, S., Railways—Draft Appliances, Switches and Signals, Surface Track, Rolling Stock, Track Sanders; Electricity, Transmission to Vehicles; Dumping Vehicles; Vehicle Fenders; Hand and Hoist Line Implements | 12-19-55 | 9-13-54 |
| 35. (IV) BROMLEY, E. D., Dispensing; Flexent Material Handling, Filling; Toilet, Kitchen and Table Articles | 12- 9-55 | 2-16-55 |
| 36. (V) McFADYEN, A. D., Measuring and Testing | 11- 2-55 | 10-19-55 |
| 37. (II) LEVY, M. L., Electricity—Switches, Welding, Heating | 11-30-55 | 5-11-55 |
| 38. (I) MARMELSTEIN, N., Carbon Chemistry (part), e. g., Aso, Carbocyclic or Acyclic Compounds (part), e. g. Anthrones, Triarylmethanes, Esters, Acids, Ketones, Aldehydes, Ethers, Phenols, Alcohols | 2- 1-56 | 10-11-55 |
| 39. (IV) WEIL, L., Fluid-Pressure Regulators; Valves; Fluid Handling (except Pressure Modulating Relays, Self-Proportioning Systems, Float Valves, Diaphragms and Bellows) | 1-31-56 | 11-10-54 |
| 40. (V) DRUMMOND, E. J., Receptacles—Metallic, Paper, Wooden, Glass; Special Receptacles and Packages | 2- 1-56 | 10- 2-55 |
| 41. (V) GURLEY, R. E., Coin Controlled Apparatus; Dispensing Cabinets; Coin Handling; Mail, Fare or Other Collection Boxes or Chutes; Buckles, Buttons and Clasps; Racks; Fire Escapes; Ladders; Scaffolds | 10- 3-55 | 9-10-54 |
| 42. (II) MARANS, H., Electric Signaling; Signals and Indicators; Telegraphy; Electrical Connectors | 8-27-55 | 11- 3-54 |
| 43. (I) ARNOLD, D., Medicines, Poisons, Cosmetics; Sugar and Starch; Skins, and Leathers; Preserving, Sterilizing and Disinfecting (except Wood Treatment Apparatus) | 11- 2-55 | 4- 1-55 |
| 44. (II) EVANS, N. H., Antennas; Automatic Pilots; Directive Radio Systems; Mass Spectrometers; Nuclear Batteries; Nuclear Resonant Devices; Neutron Detecting and Measuring; Radar; Sonar; Torpedoes | 7-22-55 | 9-10-54 |
| 45. (VI) MANIAN, J. A., Wheels, Tires and Axles; Railway Wheels and Axles; Lubrication; Bearings and Guides; Belt and Sprocket Gearing; Spring Devices; Animal Draft Appliances | 11- 4-55 | 2-18-55 |
| 46. (I) WILES, W. G., Actinide Series (e. g., Eastonable) Compounds; Sintered Metal Stock; Explosives; Power Plants (part); Metallurgy (part); Surgery (part); Radioactive Medicines; Irradiation Chemistry; Carbon Chemistry (part) | 12- 7-55 | 1-12-55 |
| 47. (VI) KANOF, W. J., Mining, Quarrying, and Ice Harvesting; Motor Vehicles; Land Vehicles | 2- 6-56 | 9-13-55 |
| 48. (II) BERNSTEIN, S., Electricity—Conversion Systems, Protective Systems; Measuring and Testing (except Meters); Spark Plugs and Ignition Systems, Switchboards, Relays, Magnets, Inductors, Transformers, Condensers, Transistors, Barrier Layer Rectifiers | 7-20-55 | 9-28-54 |
| 49. (VII) BENDETT, B., Drying and Gas or Vapor Contact with Solids; Ventilation; Wells; Earth Boring | 11-21-55 | 4- 4-55 |
| 50. (I) BENGEL, W. G., Carbon Chemistry (part), e. g. Synthetic Resin Compositions, Synthetic Rubber Compositions, Natural Rubber | 1- 6-56 | 11- 3-54 |
| 51. (II) YAFFEE, S., Radio Transmitters, Receivers and Tuners; Modulators; Piezoelectric Devices; Music | 2- 1-56 | 9-13-54 |
| 52. (V) NEFF, P. R., Supports; Joint Packing; Valved Pipe Joints or Couplings; Rod Joints or Couplings; Tool Handle Fastenings; Pipes and Tubular Conduits; Shaft Packing | 12- 9-55 | 12-24-54 |
| 53. (IV) REYNOLDS, E. R., (NINAS, G. A., acting), Label Pasting and Paper Hanging; Books and Book Making; Mailfolding; Printed Matter; Stationery; Paper Files and Binders; Flexible or Portable Closures or Partitions; Doors, Windows, Awnings and Shutters; Harness; Whip Apparatus | 1-20-56 | 6-24-55 |
| 54. (II) NILSON, R. G., Electric Lamps; Electronic Tubes; Miscellaneous Discharge Devices; Lamp, Cathode Ray and Gas Discharge Device Circuits; Ray Energy (e. g. X-Ray, Ultraviolet, Radioactive) Applications | 12-12-55 | 12- 1-54 |
| 55. (VII) KLINE, J. R., Surgery; Dentistry; Artificial Body Members; Separating and Sorting Solids; Centrifugal Bowl Separators; Comminuters | 2-23-55 | 12- 1-54 |
| 56. (I) SPECK, J. E., Abrading Compositions; Batteries; Coating or Plastic Compositions; Electrical and Wave Energy Chemistry | 1-26-56 | 11-18-55 |
| 57. (III) MILLER, A. B., Bolt, Nut, Rivet, Nail, Screw, Chain and Horseshoe Making; Driven and Screw Fastenings; Nut and Bolt Locks; Jewelry; Pipe Joints or Couplings | 4-10-56 | 5- 5-55 |
| 58. (III) BRONAUGH, F. H., Rolls and Rollers; Making Metal Tools and Implements; Stone Working; Abrading Processes and Apparatus; Feed Apparatus; Closure Operators; Baths, Closets, Sinks and Spittoons | 12-14-55 | 4-21-55 |
| 59. (I) HENKIN, B., Inorganic Chemistry; Fertilizers; Gas, Heating and Illuminating | 12-19-55 | 3-24-55 |
| 60. (I) MANGAN, P. E., Carbon Chemistry (part), e. g., Synthetic Resins, Synthetic Rubber; Photographic Processes and Products | 12-29-55 | 1-24-55 |
| 61. (III) MORSE (Miss), E. L., Winding and Reeling; Pushing and Pulling; Horology; Time Controlling Apparatus; Railway Mail Delivery | 2- 6-56 | 2-16-55 |
| 62. (IV) SHAPIRO, A., Games; Toys; Amusements and Exercising Devices; Mechanical Guns and Projectors; Illumination | 2- 6-56 | 2-17-55 |
| 63. (I) WINKELSTEIN, A. H., Foods and Beverages; Carbon Chemistry (part), e. g., Lignins, Carbohydrate Derivatives; Fats and Metal Containing Carbocyclic or Acyclic Carbon Compounds | 2- 1-56 | 1-13-55 |
| 64. (I) GREENWALD, J., Fuels; Miscellaneous Compositions | 2-13-56 | 1- 3-55 |
| 65. (V) LISANN, L., Geometric Instruments; Automatic Weighing Scales; Acoustics | 12-29-55 | 9- 7-54 |
| 67. (VII) KRAFFT, C. F., Laminated Fabrics; Ornamentation; Bleaching, Dyeing, Fluid Treatment of Textiles | 9-26-55 | 2-18-55 |
| 69. (II) GALVIN, D. J., Wave Guides; Electric Motors; Sound Recording; Conductors; Insulators | 1- 3-56 | 8-11-54 |
| 70. (II) BREWRINK, J. L., Security laws administration | 3- 2-56 | 1- 9-56 |
| CLASS. DIVS. I BAILEY, J. S., Paper Making; Mineral Oils | 2- 6-56 | 9- 1-55 |
| CLASS. DIVS. II LADY, J. E., Oscillators; Amplifiers; Resistances and Rheostats | 1-12-56 | 8- 3-55 |
| CLASS. DIVS. III WAHL, E. A., Cutting and Punching; Apparel (part), e. g., Corsets and Brassieres | 1-26-56 | 9-24-55 |
| CLASS. DIVS. IV SMITH (Mrs.), M. P., Harrows and Diggers; Plows; Fluid Sprinkling, Spraying and Diffusing | 2- 2-56 | 2- 1-56 |
| CLASS. DIVS. V ANGLE, C. D., Liquid Separation or Purification; Sewerage | 4- 4-56 | 5- 3-56 |
| DESIGNS (III) A—MONCURE, J. A. (acting), Industrial Arts | 3-19-56 | 4-17-56 |
| DESIGNS (III) B—GRAY, M. A., Household, Personal and Fine Arts | | |

The following divisions have been abolished: 63 and 66

## EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during December 1956, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1955.*

| | |
|---|---|
| Patents | Numbers 2,181,858 to 2,185,169, inclusive |
| Plant Patent | Numbers 349 to 351, inclusive |

# PATENT SUITS

**Notices under 35 U. S. C. 290; Patent Act of 1952**

2,110,768, R. L. Tweedale, Cooking device, filed Nov. 29, 1954, D. C., E. D. Mich. (Detroit), Doc. 13945, *Ralph L. Tweedale* v. *Sunbeam Corp.* Judgment for defendant Oct. 26, 1956.

2,180,689, 2,264,989, S. J. Geddings, Loom; 2,389,889, same, Let-off mechanism for looms; 2,420,473, same, Feeler controlled filling replenishing mechanism; 2,540,574, same, Felt for papermaking machines, filed Dec. 31, 1953, D. C., E. D. S. C. (Charleston), Doc. 4067, *Mt. Vernon-Woodberry Mills, Inc.* v. *Saint Julian Geddings.* Consent dismissal Sept. 28, 1956.

2,182,198, P. M. Johanning, Stone cutting machine, filed Dec. 7, 1955, D. C., W. D. Okla. (Oklahoma City), Doc. 6908, *G. B. Ents* v. *William (Bill) Grubbs.* Consent judgment; patent held valid and infringed; patent now expired, no injunction issued; cross-complaint dismissed Oct. 1, 1956.

2,235,165, J. W. Heitzel, Adjustable screed, filed Oct. 25, 1956, D. C., N. D. Ohio (Cleveland), Doc. 33179, *Flexible Road Joint Machine Co.* v. *General Road Machines, Inc. et al.*

2,247,786, H. S. Ackerman, Heating boiler, filed July 3, 1950, D. C. N. J. (Newark), Doc. 545/50, *John A. McConce, Receiver for Hook and Ackerman Inc. et al.* v. *George J. Smith.* Action dismissed Oct. 29, 1956.

2,257,695, Valentine and Peña, Powder puffs, and similar articles, and means and method of making the same, filed Mar. 3, 1955, D. C., S. D. N. Y., Doc. 99/116, *Hygienol Co., Inc.* v. *Velcourt, Inc.* Stipulation and order of dismissal Oct. 30, 1956.

2,269,269. (See 2,150,059.)

2,272,769, 2,272,782, 2,272,883, Habib and Gott, Manufacture of articles from liquid dispersions; 2,461,270, Habib and Greenlie, Balloon mold; 2,461,271, same, Method of manufacturing balloons, filed Apr. 30, 1956, D. C. Md. (Baltimore), Doc. 8846, *W. R. Grace & Co.* v. *H. B. Hirsch & Sons, Inc.* Stipulation dismissing complaint and counterclaim without prejudice Oct. 30, 1956.

2,273,769. (See 2,273,769.)

2,273,883. (See 2,273,769.)

2,284,969. (See 2,150,059.)

2,462,468, Galber and Golick, Cold pressure gluing without retaining clamps, filed Oct. 24, 1956, D. C. Oreg. (Portland), Doc. 5860, *Monsanto Chemical Co.* v. *Linn Plywood Corp.*

2,438,473. (See 2,150,059.)

2,443,170, R. S. Smith, Reinforced sheet metal, filed Oct. 30, 1956, D. C. N. J. (Newark), Doc. 863/56, *Rigidized Metals Corp.* v. *The Kenilworth Steel Co.*

2,461,270. (See 2,273,769.)

2,461,271. (See 2,273,769.)

2,465,257, J. T. Correll, Therapeutic sponge and method of making, filed Oct. 26, 1956, D. C., S. D. N. Y., Doc. 114/155, *The Upjohn Co.* v. *Italian Drugs Importing Co. Inc. et al.*

2,469,574. (See 2,150,059.)

2,525,692, C. J. Heitzel, Machine for spraying concrete curing compound, filed Oct. 25, 1956, D. C., N. D. Ohio (Cleveland), Doc. 33178, *Carl J. Heitzel* v. *General Road Machines, Inc. et al.*

2,570,627, M. M. Brown, Method of and apparatus for mending hosiery, filed Aug. 28, 1956, D. C., W. D. N. C. (Charlotte), Doc. 1189, *Marvel Specialty Co., Inc.* v. *Blackwelder Textile Co., Inc. et al.* Injunction issued Oct. 29, 1956.

2,592,134, S. Y. Gibbon, Apparatus for the treatment of croup; 2,694,397, same, Equipment for treatment of respiratory ailments, filed July 22, 1955, D. C., S. D. Tex. (Houston), Doc. 9056, *Air-Shields, Inc.* v. *Lowenstein Corp.* Consent judgment Oct. 24, 1956.

2,630,633, T. F. Peterson, Helically-preformed elements on stranded line; 2,761,272, same, Dead end for cables, filed Oct. 29, 1956, D. C., N. D. Ohio (Cleveland), Doc. 33196, *Preformed Line Products Co.* v. *The Fenner Mfg. Co.*

2,634,327. (See 2,592,134.)

2,637,775, F. L. Albel, Knitted fabric, filed Oct. 26, 1956, D. C., S. D. N. Y., Doc. 114/145, *Artvale, Inc.* v. *North & Co. Inc.*

2,637,956. (See Re. 24,166.)

2,676,943, J. J. Steffan, Keeper mechanism, appeal filed Apr. 9, 1956; C. C. A., 8th Cir., Doc. 15551, *Julius A. Steffan et al.* v. *Weber Heating and Sheet Metal Co. et al.* Judgment of District Court affirmed Oct. 29, 1956.

2,708,578, C. F. Mitchell, Bowling ball finger patch, filed Oct. 30, 1956, D. C., N. D. Ohio (Cleveland), Doc. 33199, *Charles F. Mitchell* v. *Akron Bowling Pin Co. et al.*

2,742,883, A. Rosner, Therapeutically active compositions containing amphetamine, filed Oct. 29, 1956, D. C., S. D. N. Y., Doc. 114/158, *Rosar Pharmacal Corp.* v. *Dolce Chemical Co.*

2,749,886, B. H. Thomas, Dispenser, filed June 12, 1956, D. C. Md. (Baltimore), Doc. 8920, *Bristol-Myers Co.* v. *Carter Products, Inc.* Consent judgment; patent held valid and infringed; defendant enjoined from further infringement (notice Oct. 30, 1956). Same, D. C., S. D. N. Y., Doc. 110/227, *Carter Products, Inc.* v. *Bristol-Myers Co.* Stipulation and order of dismissal Oct. 31, 1956.

2,761,272. (See 2,630,633.)

2,762,289, G. B. Ents, Stone cutting machine; 2,762,631, same, Mechanism for raising and lowering frames of trailers with respect to ground wheels thereof, filed Oct. 18, 1956, D. C., W. D. Ark. (Fort Smith), Doc. 1315, *G. B. Ents* v. *Ezee Stone Cutter Mfg. Co.*

2,762,631. (See 2,762,289.)

Re. 24,166 (of 2,637,956), B. Stiller, Self-closing container, filed Oct. 26, 1956, D. C., M. D. N. C. (Greensboro), Doc. 1062-G, *Benjamin Stiller* v. *Thornton Sales Service.*

Des. 178,682, J. H. Koch, Ash receiver or similar article, filed Oct. 24, 1956, D. C., S. D. Calif. (Los Angeles), Doc. 20634-T, *Benjamin R. Blythe* v. *Builders Emporium et al.*

Des. 178,978, N. G. Wintermantel, Velocipede, filed Oct. 25, 1956, D. C., N. D. Ill. (Chicago), Doc. 56c1760, *Junior Toy Corp.* v. *Hedstrom Union Co. et al.*

# REISSUES

## DECEMBER 4, 1956

**Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.**

### 24,242
### ALLOYS AND ELECTRICAL RESISTANCE ELEMENTS

**James M. Lohr, Morristown, N. J., assignor to Driver-Harris Company, Harrison, N. J., a corporation of New Jersey**

**No Drawing. Original No. 2,581,420, dated January 8, 1952, Serial No. 117,516, September 23, 1949. Application for reissue June 29, 1956, Serial No. 595,041**

**16 Claims. (Cl. 75—171)**

*9. An electric resistance element consisting essentially of 50 to 70 percent nickel, 10 to 25 percent chromium, .01 to .20 percent calcium, .01 to 1.0 percent aluminum, a trace to .50 percent of a rare earth metal, balance essentially iron.*

### 24,243
### ALLOYS AND ELECTRICAL RESISTANCE ELEMENTS

**James M. Lohr, Morristown, N. J., assignor to Driver-Harris Company, Harrison, N. J., a corporation of New Jersey**

**No Drawing. Original No. 2,637,954, dated August 31, 1954, Serial No. 252,198, October 19, 1951, which is a division of Serial No. 117,516, September 23, 1949, now Patent No. 2,581,420, dated January 1, 1952. Application for reissue June 29, 1956, Serial No. 595,042**

**8 Claims. (Cl. 75—124)**

*5. An electric resistance element consisting substantially of 35 percent nickel, substantially 20 percent chromium, .001 to .20 percent calcium, .01 to 1.0 percent aluminum, a trace to .50 percent of a rare earth metal, balance essentially iron.*

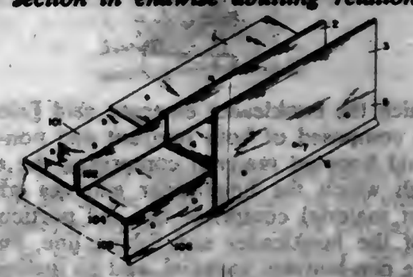
### 24,244
### ALLOYS AND ELECTRICAL RESISTANCE ELEMENTS

**James M. Lohr, Morristown, N. J., assignor to Driver-Harris Company, Harrison, N. J., a corporation of New Jersey**

**No Drawing. Original No. 2,637,956, dated August 31, 1954, Serial No. 263,989, December 28, 1951. Application for reissue June 29, 1956, Serial No. 595,043**

**6 Claims. (Cl. 75—171)**

*4. An electric resistance element of the 80% nickel 20% chromium type having a greater tolerance for iron without materially affecting its resistance to oxidation at elevated temperatures consisting of about 20% chromium, from 0.2% to 2% of silicon, from 0.05% to 1% manganese, from 0.02% to 0.25% carbon, from 0.1% to 1% aluminum, from 0.01% to 0.2% calcium, a trace to 0.5% of at least one rare earth metal, and the balance nickel.*



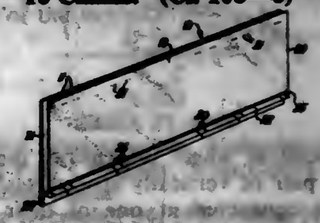
### 24,245
### ROOF GUTTER

**Druz Agar, Miami Beach, Fla.**

**Original No. 2,646,011, dated July 21, 1953, Serial No. 269,235, December 6, 1951. Application for reissue April 5, 1955, Serial No. 499,944**

**3 Claims. (Cl. 108—28)**

*6. In a roof gutter assembly having a trough section including a rear anchor strip adapted to underlie the marginal edge portion of a roof covering, a rear upstanding pleat, a front upstanding pleat spaced forwardly therefrom and a trough bottom intervening therebetween, said front pleat including a downwardly directed fold extending below said trough bottom to define a flashing member, the combination with said trough section, of a spillway section in endwise abutting relation therewith*



*for the reception of water therefrom, said spillway section having an anchor strip, rear pleat, trough bottom, and flashing member each adapted to partially underlie corresponding parts of said trough section in slideable relation therewith to permit the longitudinal adjustment of said spillway section relative to said trough section.*

### 24,246
### MULTIPLE SHINGLE STRUCTURE

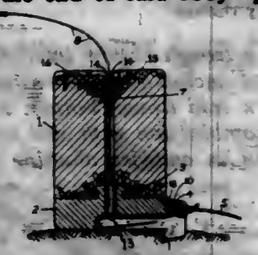
**Carl J. Flink, Clarence, and Charles E. Heintz, Elma, N. Y., assignors to Cree-Dipt Company, Inc., North Tonawanda, N. Y., a corporation of New York**

**Original No. 2,672,831, dated March 23, 1954, Serial No. 321,424, November 19, 1952. Application for reissue March 9, 1956, Serial No. 570,660**

**16 Claims. (Cl. 108—8)**

*11. As an article of manufacture, a multiple shingle structure comprising a row of separate nailable shingles arranged in edge-to-edge relation, separate backing means extending along the greater part, both longitudinally and transversely, of the rear side of said row and of each individual shingle thereof, a narrow nailable strip capable of receiving and also anchoring nails extending along the rear of said backing means along substantially the full length and adjacent one longitudinal edge of said row and remote from the opposite longitudinal edge thereof, said backing means being interposed between said nailable strip and said row of shingles, and means securing each shingle and said backing means adjacent said one longitudinal edge of said row to said nailable strip.*

### 24,247
### COMBINED WEIGHTS AND ASSEMBLY MEMBERS



**Walter Gehrig, Flint, Mich.**

**Original No. 2,710,479, dated June 14, 1955, Serial No. 91,032, May 3, 1949. Application for reissue February 9, 1956, Serial No. 564,605**

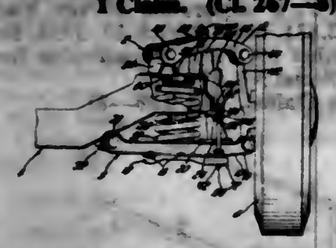
**14 Claims. (Cl. 43—43.1)**

1. A combined fishing device and assembly member for a fishing line and a flexible hookleader formed with

a looped end, comprising a body having a passageway extending therethrough adapted to receive a portion of the hookleader including the looped end thereof with the remainder of said hookleader protruding beyond one end portion of said body, said passageway having the end thereof through which the hookleader emerges flared into a bell-shaped bending form, means provided for the attachment of the looped end of the hookleader and the fishing line to the end of said body opposite to that

through which the hookleader emerges, said [elongated] body being composed of both buoyant and non-buoyant material, said buoyant material comprising the end portion through which the hookleader emerges while said non-buoyant material comprises the end portion for attachment of the hookleader and fishing line, an anchor hook on the non-buoyant material, and an inclined water current engaging surface on said body slanting downwardly toward the line-attaching means against which water may react to force said anchor downwardly.

---



**24,248**

**INDEPENDENT VEHICLE WHEEL SUSPENSIONS**

**Kal H. Hansen, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware**

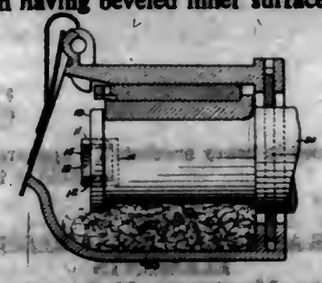
**Original No. 2,731,257, dated January 17, 1956, Serial No. 318,701, November 4, 1952. Application for reissue September 24, 1956, Serial No. 611,802**

**1 Claim. (Cl. 267—8)**

In an independent wheel suspension, the combination of a frame, a pair of vertically spaced wishbone control arms pivotally connected at one of their ends to said frame, a wheel supporting member pivotally mounted on the other ends of said arms, a mounting plate carried by the lower of said control arms and having an integral extension extending beyond each of the opposite side edges of said arm, a substantially vertically disposed rectilinearly operating shock absorber operatively connected to one of said extensions and to said frame, a vehicle stablizing torsion bar operatively connected to the other of said extensions and to said frame, a [coil] spring disposed between said mounting plate and said frame, said spring engaging said mounting plate [at points disposed] between the points of attachment thereon of said shock absorber and stabilizing torsion bar, and a seat formed in said mounting plate supporting said spring.

---

**24,249**



**RAILWAY JOURNAL BOX STABILIZER**

**Milton M. Johnson, Temple, Tex.**

**Original No. 2,704,694, dated March 22, 1955, Serial No. 283,184, April 18, 1952. Application for reissue November 23, 1955, Serial No. 548,797**

**6 Claims. (Cl. 308—40)**

1. In a stabilizing device for a railway car journal box, a pair of shoes each provided with beveled edges at their sides and an arcuate surface, a U-shaped frame including a cross-bar having arms extending therefrom, said arms each having beveled inner surfaces, said frame

adapted to be secured to the inner surface of a journal box and the beveled surfaces of the arms adapted to receive corresponding beveled edges at the sides of the shoes.

---

**24,250**

**ELECTRICIAN'S FISH TAPE REEL**

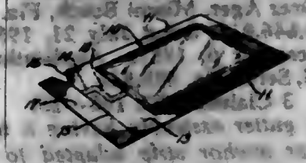
**Henry Waldschmidt, Culver City, Calif.**

**Original No. 2,699,709, dated September 21, 1954, Serial No. 383,461, October 1, 1953. Application for reissue May 23, 1955, Serial No. 510,596**

**24 Claims. (Cl. 254—134.3)**

1. In a fish tape reel, a toroidal reel drum of channel section including a web on which the tape may be wound and a pair of flanges projecting radially outwardly therefrom and having peripheral lips which are axially opposed to define a circumferential slot through which the tape is adapted to pass with an interference fit; a *frame* [handle] of arcuate sleeve form, enclosing a segment of said drum and circumferentially slidable thereon; an actuator lever pivoted to said *frame* [handle] on an axis parallel to the drum axis; and a roller of discus form rotatably mounted in said lever in the plane of said slot and projecting into said slot, said roller having frusto-conical side walls engageable with said lips with a wedging action for spreading the lips adjacent the point of emergence of the tape through said slot when said lever is tilted to move said roller radially inwardly.

---



**24,251**

**DISPENSING CONTAINERS FOR LIQUIDS**

**Yale Kaplan, West Hartford, Conn., and Harold M. Rose, Plainfield, N. J., assignors of one-third to Hyman Bodner, Brooklyn, N. Y.**

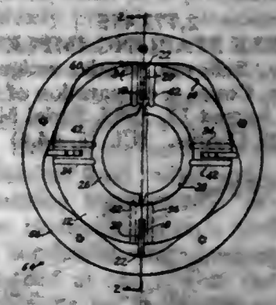
**Original No. 2,707,581, dated May 3, 1955, Serial No. 473,523, December 7, 1954. Application for reissue May 11, 1956, Serial No. 584,407**

**3 Claims. (Cl. 222—107)**

*3. The combination comprising, a container for liquids formed of two portions of flexible plastic sheet material with a generally flat shaped cavity therebetween containing a body of liquid, said container being completely sealed about its periphery to retain said liquid against escape, at least one side of the periphery of said container including portions of said sheet material which form continuations of the side walls of said container and which are sealed together over a broad area, such broad sealing area of said extensions being interrupted to form a dispensing passage of tortuous shape having an intermediate portion extending substantially transversely of the container, said passage extending from said cavity to and terminating at an intermediate point in said broad sealed area, a transverse portion of said broad area being readily severable from an outer edge thereof at least to said intermediate point whereby when said portion is severed said passage for discharge of said liquid is opened when sufficient pressure is applied to the container walls to cause separation of the passage walls, portions at least of the walls of the tortuous passage acting to come together again upon release of such pressure to check further dispensing of the liquid.*

---

**24,252**



**HYDRAULIC MOTORS**

**Ephraim W. Hagen, Baltimore, Md.**

**Original No. 2,730,076, dated January 10, 1956, Serial No. 290,870, May 31, 1952. Application for reissue August 3, 1956, Serial No. 602,097**

**8 Claims. (Cl. 121—56)**

1. A hydraulic power converter comprising a stator [including a cylindrical body having] *member and a cooperating rotor member, one of which is provided with* equi-spaced radially disposed slots, blades reciprocal in the slots, [a rotor cooperating with said stator and including a ring] *the other of said members* having a channel contoured to provide sine or cosine cam surfaces constituting chambers for the reception of the blades, there being N+1 chambers for every N blades, [means urging the blades radially outward] *said blades being*

*adapted to be urged against said cam surface*, means for delivery of all of the fluid supplied to any chamber back of the respective blades and means for discharge of all of the fluid in each chamber immediately forward of the respective blades, [the variation in spacing of] said [rotor and stator] surfaces being [such] *so related* that the sum of the exposed areas of all the [slidable] blades in said chambers remains substantially constant during rotation of said rotor.

---

# PLANT PATENTS

## GRANTED DECEMBER 4, 1956

**Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.**

**1,532**

**PECAN TREE AND NUT**

**Fred A. Mahan, Monticello, Fla.**

**Application November 28, 1955, Serial No. 549,904**

**1 Claim. (Cl. 47—62)**

A new variety of pecan tree as herein disclosed and illustrated being cross bred from the Mahan and Stuart varieties, said tree being rapid in growth, vigorous, having leaves large and rather pointed, and having a bark with prominent markings and blisks which produce buds which are rather sharply pointed at their apex and whose blooms appear a week earlier than the Stuart and whose nuts mature about ten days earlier in the fall than the Stuart variety, and its nuts averaging about 1¼ inches in diameter, and about four inches round and having a length of about two to two and one-quarter inches, the nuts being ovate shaped with a pointed apex at one end and a plump rounded portion at the other end, the kernel being better flavored than the Mahan or Stuart variety and having a moderately high percentage of oil, plump and relatively thick and easily separable from the shell, the shell thereof being of medium brown color, with black markings prominent at the apex end of the shell, said shell being medium thin with striations running longitudinally of the nut.

---

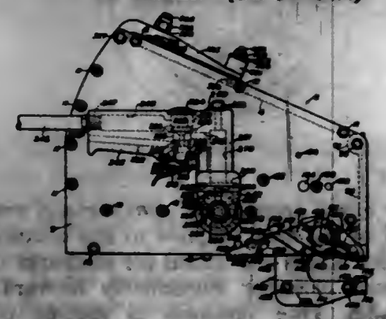
**1,533**

**ROSE PLANT**

**Gerrit de Ruiter, Hazerswoude, Netherlands, assignor to The Conard-Pyle Company, West Grove, Pa., a corporation of Pennsylvania**

**Application December 30, 1955, Serial No. 556,763**

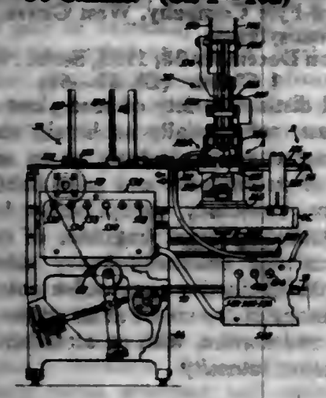
**1 Claim. (Cl. 47—61)**



A new and distinct variety of rose plant of the hybrid polyantha class, substantially as herein shown and described, characterized particularly as to novelty by the combination of its vigorous and good habits of growth, the abundance, constancy, exceptionally large size and unusually outstanding sweet fragrance of its flowers, the excellent form and unusually heavy substance of its flowers, and the distinctive progressive color change and complete harmony of the colors at all stages of the flowers as they open and mature, with an attendant and unusual increase in color intensity.

# PATENTS

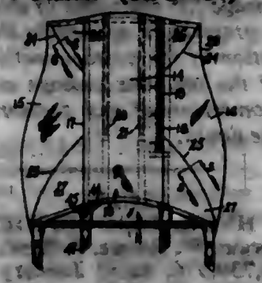
## GRANTED DECEMBER 4, 1956



## GENERAL AND MECHANICAL

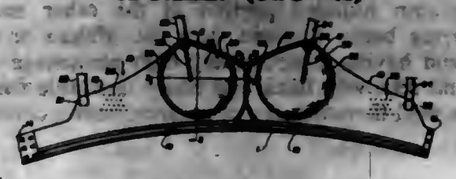
**2,772,415**
**PORTABLE STAPLING IMPLEMENT**
Robert W. Jenny, Bellevue, Wash., assignor to Bostitch, Inc., Stonington, Conn., a corporation of Rhode Island
Application August 17, 1955, Serial No. 528,867
20 Claims. (Cl. 1—44.4)

1. In a stapling machine having a casing, a staple-driver therein for driving staples, a magazine for containing a supply of staples, and means for feeding the staples to said driver; the combination of an anvil movably mounted on the casing to clamp the work against said casing, a single member connected to said anvil to move it for clamping the work and connected to said driver for moving it to drive a staple thereinto, a chamber for fluid pressure in said casing, and manually-operable means on said casing for releasing said fluid pressure to actuate said member to initially operate said anvil and thereafter operate said staple-driver.



**2,772,416**
**APPARATUS FOR ASSEMBLING WORKPIECES**
Adolph S. Dorsey, Beverly, and Thomas W. Snow, Melrose, Mass., assignors to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application September 27, 1954, Serial No. 458,328
36 Claims. (Cl. 1—102)

1. Apparatus for assembling components on work pieces comprising a series of machines respectively having tools operative to apply components successively, means for simultaneously feeding a plurality of the work pieces singly from one machine to the next in the series, and positioning and clamping means associated with each machine for disassociating successive work pieces from said feeding means and holding them in fixed relation to the operating paths of said tools.

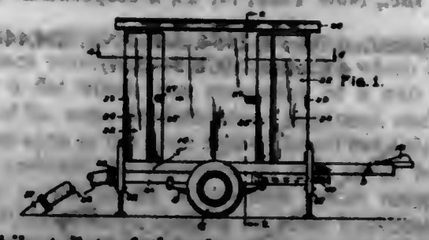


**2,772,417**
**GIRDLE OR LIKE GARMENT**
Emery C. Champagne, Woodbridge, Conn., assignor to The Berger Brothers Company, New Haven, Conn., a corporation of Connecticut
Application March 1, 1954, Serial No. 413,210
1 Claim. (Cl. 2—37)

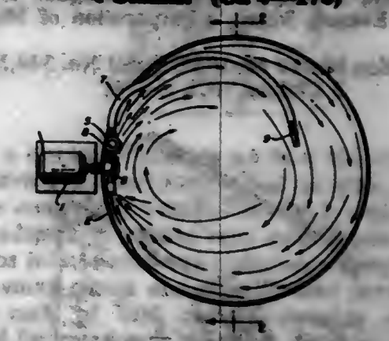
A girdle-type garment having a rear section and a front section of substantially equal dimensions girthwise, said front section comprising a central front panel of inelastic material and a pair of side panels of elastic material, one on each side of the front panel, each of said side panels having its inner edge joined to the adjacent edge of the front panel and its outer edge joined to a side edge of the rear section to form a body-encircling garment, each of said side panels comprising an inner and an outer ply of elastic material, the outer ply extending from the upper to the lower edge of the garment and being coextensive with the panel of which it forms a part, the inner ply extending from the upper to the lower edge of the garment at the edge of the panel joined to the rear section of the garment and being shorter than the outer ply at its edge joined to the central panel of the front section, whereby the upper edge of the inner ply slopes downwardly and the lower edge of the inner ply is inclined upwardly toward the central panel, and each side panel has substantially triangular-shaped portions of single-ply thickness at the upper and lower edges of the garment adjacent the junction of the side panels with the central panel, and the inner ply being secured by seam lines at all edges thereof to the outer ply.

**2,772,418**
**RUBBER LATEX BRASSIERE**
Lois A. Spaeth, New York, N. Y., assignor to International Latex Corporation, a corporation of Delaware
Application January 11, 1954, Serial No. 403,190
11 Claims. (Cl. 2—42)

1. A brassiere comprising back and breast portions and means for causing a girthwise tension in the breast portions, said breast portions made of readily pliable deposited latex material which elastically embrace and conform to the body, said breast portions each comprising an outwardly extending preformed cup to accommodate the breast, said breast portions having finger-like bands made solely of deposited soft pliable latex, said finger-like bands being elastic but relatively more resistant to stretch than the remainder of said breast portions and positioned in the region of and forming a part of the wall of the breast portions between the center lines of the cups forming a unitary structure with the latex breast portions for resisting lateral separation of the breasts, due to the elasticity of the pliable latex of the remainder of the breast portions when the girthwise tension is produced in the breast portions.



**2,772,419**
**LADIES' UNDERGARMENT**
Murray Silverstein, Great Neck, N. Y.
Application February 23, 1956, Serial No. 567,276
1 Claim. (Cl. 2—224)

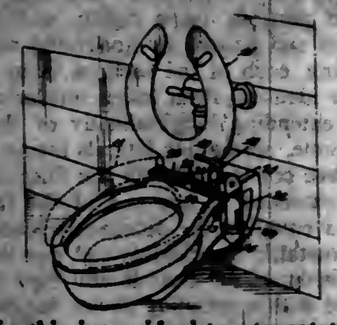


A lady's panty comprising an upper waist enclosing section and a pair of leg encircling sections and formed from two blanks of generally elongated shape, one of said blanks enclosing a major portion of the body of the wearer and having a generally straight upper edge, a lower edge having a plurality of concave edge sections, and opposed, somewhat shorter generally vertical edges, said concave lower edge sections including a relatively short central section and sections on each side thereof which terminate at the outer ends in straight sections, said blank being stretchable in a direction extending around the waist of the wearer, the second blank being stretchably vertically thereof and having a straight upper edge forming the rear upper edge of the garment, a convexly curved lower edge, and opposed lower side edge sections of concave contour and substantially straight upper side edge sections, the latter edge sections being stitched to the opposed vertical edges of the first blank to form a body enclosing section, the lower edge of the second blank being stitched to the central concave lower edge section of the first blank to form a crotch section, the lower concave side edges of the second blank and the remaining lower edge sections of the first blank forming the lower edges of the leg encircling sections, and elastic bands secured to the upper and lower free edges of the garment, the upper edge of the second blank being puckered to provide added fullness upon upon stretching of the waist band.

**2,772,420**
**MOBILE TOILET**
George E. Carter, Fort Lauderdale, Fla.
Application September 20, 1954, Serial No. 457,123
1 Claim. (Cl. 4—11)

A mobile toilet of the character described that comprises a frame having ground wheels and a draft device, a rectangular housing supported on the frame and that is divided transversely to form a pair of substantially identical sections, each of the sections being provided with a door opening at one side of the housing, a combined closure and protective shield for each of the openings, said shield each being hinged at the corners of the housing and with the edge of the shield having latching means whereby they are secured in closed covering position over the openings, each of the shields embodying a closure panel having an inwardly angled free edge whereby the shield when in a predetermined open position will adequately provide a clearance passage to the door opening and simultaneously screen the opening against visual observation to the sections, the panels and their angled portions being rigidly and integrally connected at top and bottom by horizontal webbed portions against flexing, each of the sections being provided with substantially identical flush toilets and urinals, a soil disposal pipe extending longitudinally of the housing beneath the frame, upstanding laterals formed upon the soil pipe that have connection with the flush toilets, the soil pipe being extended at one end of the frame and provided with a coupling for detachable sealing connection with a non-metallic and flexible soil pipe of substantially the same diameter, the flexible soil pipe at its opposite end provided with a coupling device for detachable sealing connection with a sewerage disposal system, the first named soil pipe at its opposite end being provided with a reducing coupling for threaded connection with a pressure water line having a cut-off valve and said water line being co-axial to the soil pipe and whereby the water line serves to flush the soil pipe and the flexible soil pipe throughout its length, the said frame at its corners being provided with adjustable ground engaging props whereby to maintain the housing and associated elements in a rigid position of use.

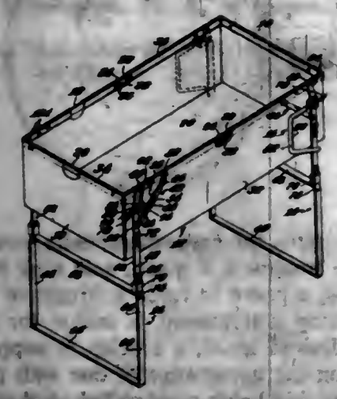
**2,772,421**
**APPARATUS FOR HYDROTHERAPEUTIC TREATMENT**
Homer C. Friend, Davenport, Iowa
Application April 19, 1954, Serial No. 424,054
4 Claims. (Cl. 4—178)



1. In apparatus for hydrotherapeutic treatment, a tank in which the treatment is given, said tank having upright wall portions, a pump to force a stream of water against a person taking a treatment, a motor for operating the pump at a desired speed, a bracket to support the pump and motor on the upper edge of one wall portion of the tank, said bracket being constructed so that the motor is located in laterally outwardly overhanging relation to said one wall portion and the pump is located in laterally inwardly overhanging relation to said one wall portion, and inlet and outlet pipes extending from the pump downwardly to within the tank in close proximity to said one wall portion to intake and discharge ends, respectively, adjacent the bottom of the tank.

**2,772,422**
**LIFTING MECHANISM FOR TOILET SEATS**
Richard R. Kershaw, Chicago, Ill.
Application July 27, 1954, Serial No. 446,014
9 Claims. (Cl. 4—251)

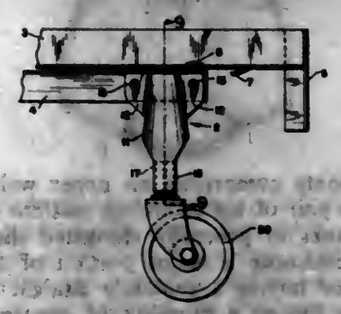
1. In combination with a toilet having a bowl and a pivotally mounted seat provided with spaced anchoring



studs for detachably mounting the seat upon the bowl, an attachment for automatically lifting the toilet seat from its lowered position including means for detachably and adjustably mounting said attachment on the bowl and retaining it by said studs, a lifting arm having one end offset and projecting beneath one side of the seat to lift the seat to elevated position when unoccupied and the arm is rotated to its raised position, a housing having a head in which the other end of said arm is journalled and a depending cylinder containing hydraulic fluid, a piston connected to said other end of said arm, spring

means for spring-biasing said piston to rotate said arm and raise the seat, means for controlling the flow of fluid under pressure from one to the opposite side of said piston as said arm is rotated and said seat is raised and lowered whereby said seat may be rapidly lowered manually to compress said spring means and when unoccupied said arm is rotated and said seat is raised slowly from its lowered position during its initial travel and then more rapidly to its fully elevated position by the expansion of said spring means, and in which elevated position the seat is retained by said arm until it is again manually lowered.

---



2,772,423
**COMBINATION BASSINET CAR BED**
Samuel Linden, Swampscott, Mass., assignor to Bunny Bear Inc., Everett, Mass., a corporation of Massachusetts
Application March 24, 1953, Serial No. 344,384
3 Claims. (Cl. 5—94)

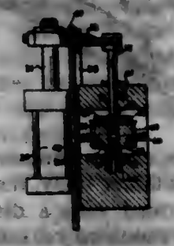
1. A combination bassinet and car bed comprising a rectangular frame, a hammock suspended from the frame for reception of a mattress, and legs joined to the frame to support it, said legs having upper and lower sections, the lower sections being longer than the upper sections, means pivotally connecting the upper ends of the lower sections to the lower ends of the upper sections in overlapping relation, said lower sections being foldable from lower positions in alignment with the upper sections upwardly into substantially parallel relation with the upper sections in which position the lower ends of the lower sections extend above the top of the frame and provide handle means for carrying the bed, and the lower ends of the upper sections constitute the footing for the bed, locking sleeves mounted on the upper sections slidable thereon into telescoping engagement with the overlapping portions of the upper and lower sections to hold said sections in rigid alignment for supporting the bed at its maximum height, said sleeves being slidable upwardly along the upper sections to disengage them from the overlapping portions of the legs to permit folding the lower leg sections and retaining clips mounted on the upper sections with which the locking sleeves may be engaged to hold them elevated.

---

2,772,424
**BEDFRAME SUPPORT LEG**
Melvin E. Roche, Strongsville, and Leslie K. Jackson, Lakewood, Ohio, assignors to The Harvard Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application October 14, 1954, Serial No. 462,264
6 Claims. (Cl. 5—176)

1. In a bedframe of contractible type, a longitudinal frame member having a horizontal support surface, a transverse frame member pivotally secured to the longitudinal member near an end thereof having in at least the end portions thereof a right angle structure with a horizontally depending flange and a vertically depending flange facing longitudinally outwardly from said frame; an integral brace and leg member having vertical portions abutted against and rigidly secured to said vertically depending flange of the transverse frame member near an end thereof, having a horizontal top flange parallel to and facing oppositely to the horizontal flange of said transverse frame member, the transverse edge of said leg flange having a greater depth in the center than at the end and said leg member having substantially throughout its entire length a vertically extending reinforcing channel portion between said vertical portions with the lower part of said channel portion being formed into a socket; said longitudinal frame member having an abutment element spaced longitudinally outward of said pivot and depending from the horizontal surface thereof, said abutment element being adapted to engage an outer transverse edge of said top flange of the leg member to limit pivotal movement thereof.

---



2,772,425
**BED COVERINGS**
Edna S. Brodie, New York, N. Y., assignor to J. P. Stevens & Co., Inc., New York, N. Y., a corporation of Delaware
Application June 4, 1954, Serial No. 434,446
4 Claims. (Cl. 5—334)

1. A bed covering having corner pleats and side and edge portions arranged for disposition at an angle to its body portion, said covering being formed of a sheet having corner portions each cut away to form a plurality of adjacent notches, edge portions of one of said notches being secured together in abutting relation to form a pocket portion arranged to fit over the corner of a mattress and the edge portions of the other notch being superposed and secured together and constituting the end of said pleat.

---

2,772,426
**DEVICE FOR INSERTING HEADED MEMBERS IN APERTURED MEMBERS**
Roy W. Bailey, John T. Fink, and Everett Gill, Detroit, Mich., assignors to Detroit Power Screwdriver Company, Detroit, Mich., a corporation of Michigan
Application January 21, 1953, Serial No. 332,363
3 Claims. (Cl. 10—139)

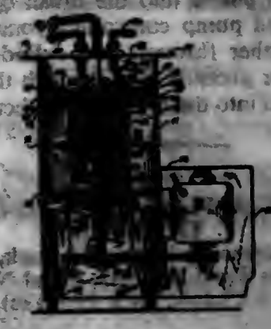
1. A device for inserting headed members in apertured members comprising a body, a pair of resiliently contacting fingers pivotally suspended from said body, a pair of spring-backed opposed jaws in said fingers slightly below the upper ends thereof and forming a first seat for suspending a headed member by its head and adapted to release said head without spreading said fingers, a second seat for an apertured member in said body below said fingers, means for pushing a headed member through said seat into an apertured member, another seat formed by the lower ends of said fingers for a head and adapted to be opened by the spreading of said fingers under pressure on said head, a fixed pin projecting from said body portion between said fingers and engageable by the fingers to limit their inward movement, a guide member adapted to receive a headed member on being pushed through the last named seat, said pin being centered with reference to the path of said guide member and lips on the outer ends of said jaws and engaging the outer surfaces of said fingers to limit the inward movement of the jaws.

---

2,772,427
**BOOK BACKBONE STRUCTURE WITH CONCEALED RIVET MEANS AND METHOD OF MAKING SAME**
Edward Charles Rankin, Oak Park, Ill., assignor to Brock & Rankin, Inc., Chicago, Ill., a corporation of Illinois
Application January 18, 1952, Serial No. 267,138
13 Claims. (Cl. 11—2)

4. The method of fabricating a book structure of the round back variety from binder's board, which comprises making a flat blank case consisting of a pair of cover boards of the same predetermined thickness, and an outer backbone strip of the same type of board but only approximately one-half the thickness of said cover boards, all hingedly joined by an outer cloth cover; rounding said outer backbone strip; making an inner backbone strip of the same board and thickness as the outer strip, and separately rounding same to a curvature substantially complementary to that of the outer backbone; fully coating the convex surface of the inner backbone with a glue of the class including hide glues, and pressing the coated inner backbone into seated intrefit with the inner surface of the outer backbone until the glue is dried.

---

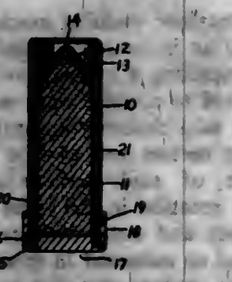


2,772,428
**SHOE PRESS PAD**
Maxwell C. Searles, Erie, Pa., assignor to Lamac Process Company, Erie, Pa., a corporation of Delaware
Application February 18, 1952, Serial No. 272,155
6 Claims. (Cl. 12—30)

3. A shoe press pad comprising a flattened tubular casing having its longitudinal axis extending lengthwise of a shoe to be pressed, said casing having top, side, and bottom sections formed of a sheet of flexible material having its side edges folded inward and cemented together by a central longitudinal seam in the bottom section of the casing, and a fluid pressure bag within the casing.

---

2,772,429
**DRINKING GLASS, TUMBLER OR THE LIKE WASHING MACHINE**
Homer Frank Lyman, Nutley, N. J.
Application June 29, 1953, Serial No. 364,800
8 Claims. (Cl. 15—76)



1. In a container washing machine for washing a container having an inner surface and an outer surface, said machine comprising a casing having a washing chamber therein adapted to contain wash-water, container washing apparatus in said chamber comprising upright inner surface cleaning means and upright outer surface cleaning means, each of said surface cleaning means being mounted for rotation in the same direction on a vertical axis, the inner and outer surface cleaning means being so shaped and so mounted in relationship to one another that the inner surface cleaning means engages the inner surface of a container positioned thereover in inverted position and the outer surface cleaning means engages the outer surface of said container, means for rotating said inner and outer surface cleaning means in the same direction, and baffle means positioned in said chamber and extending below the uppermost water level in the chamber, said baffle means comprising horizontally extending, vertically spaced plates positioned adjacent the upper end of said surface cleaning means, said plates being substantially coextensive with said washing chamber and having an opening therein in vertical alignment with said cleaning means through which a container is inserted in inverted position for washing, and baffles extending between said plates in said space therebetween and positioned to direct wash-water toward said surface cleaning means, the lower plate having a plurality of spaced water openings therein.

2,772,430
**DISH CLEANING DEVICE WITH DETERGENT FEED**
Irving J. Moritz, Brooklyn, N. Y.
Application July 13, 1953, Serial No. 367,469
2 Claims. (Cl. 15—133)

1. A dish cleaning device of the character described, comprising a tapered tubular body, a brush head at the contracted end of said body, a one-piece moulded tubular handle member at the other end of said body, said handle member having one-diameter bores opening through both ends, the bore at one end of said member forming a storage chamber for a liquid detergent, a detachable cap for closing said chamber, said bores being divided by a web and an integral hollow cylinder traversing the bores adjacent the other end of said member, the integral structure of said handle member facilitating moulding thereof, said cylinder having a port communicating with the bore at the second named end of said member, the cylinder having a valve controlled aperture opening into said chamber, a manually and spring operated pump in said cylinder and accessible outwardly of said member, a collar mounted in said member and cylinder for retaining the pump against displacement from said cylinder, said head having a discharge passage, through which detergent passes into the brush of said head, and operation of said pump controlling transfer of detergent from said chamber through said cylinder and into said tubular body for pressure feed through the discharge passage of said head into the brush of said head.

2,772,431
**DISPENSING APPLICATOR AND CONTAINER THEREFOR**
Matthew B. Blish, Oak Park, Ill.
Application April 23, 1952, Serial No. 283,820
3 Claims. (Cl. 15—136)

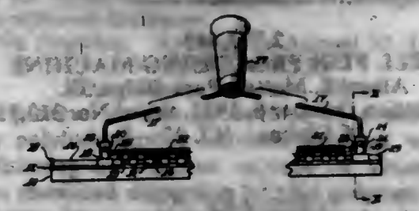
1. In a dispensing applicator container construction comprising a container having an aperture at one end adapted for dispensing matter carried within the container, a refilling aperture closure member fixedly engageable into and removably closing a refilling aperture at the opposing end, a removable container covering cap member having a closed end and an opposing open end, the inside width of said covering cap member being slightly greater than the outside width of the container and adapted to cover said container at a close dimensional tolerance with the container wall portion, in combination therewith the improvement comprising a longitudinally extending peripheral flange carried by said aperture closure member and disposed laterally beyond the peripheral edge of the refilling aperture end of the container and formed to longitudinally extend in parallel alignment with the outer surface of said container side wall portion adjacent to said refilling aperture end of the container and spaced apart from the container wall portion at a slightly greater distance than the thickness of the covering cap member side wall and providing a friction retaining recess between the inner surface of the longitudinally extending peripheral flange and the outer surface of the container side wall portion removably receiving said covering cap member.

2,772,432
**PLASTIC TUBE WITH SPREADER**
John Andreola, Bronx, N. Y.
Application March 30, 1954, Serial No. 419,760
4 Claims. (Cl. 15—139)

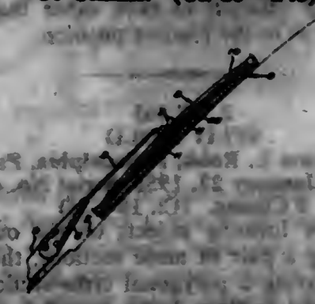
1. A combined dispensing container and spreader device comprising a container body, means closing one end of the body and formed with a dispensing aperture, a closure cap movably mounted on said means and having a dispensing opening registrable with said aperture in one position to which the cap is moved, and a spreader device mounted on said means for adjustment between an inoperative position spaced from the cap and an operative position adjacent the dispensing opening of the cap, said means comprising a container end wall and a neck on said end wall having an end wall in which said aperture is formed, said spreader device being pivotally attached to the container end wall, the cap having means engageable by the spreader device on swinging of the spreader device to operative position, said last-named means comprising a wing projecting radially and outwardly from the cap in the path of swinging movement of the spreader device, the cap being rotated by the spreader device to a position in which said opening and aperture move into registration substantially simultaneously with movement of the spreader device to its operative position.

2,772,433
**ECONOMY TOOTHBRUSH**
Nicholas A. Brundo, Boonville, Mo.
Application April 27, 1951, Serial No. 223,285
1 Claim. (Cl. 15—176)

In a toothbrush, a handle having a recess with an inclined bottom portion and inwardly directed side walls, a transversely extending rib on the bottom of the recess, and a body of resilient material having a plurality of bristles to provide a brush portion, said body having an integrally formed downwardly and angularly extending leg provided with a transversely extending notch on its under side arranged to engage the rib on the handle, the body having a slot between the leg and the brush portion to allow the leg to be sprung towards the brush portion to release the notch from the rib, said notch and rib being rounded, the sides of the body at the brush portion being inclined to tightly engage the inwardly directed walls.

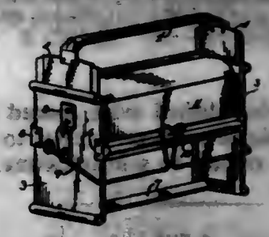


2,772,434
**SHAMPOO BRUSH WITH DETACHABLE HANDLE**
Nathan L. Solomon, Englewood, N. J.
Application February 7, 1955, Serial No. 486,843
5 Claims. (Cl. 15—179)



1. The combination with a brush, comprising a body portion having projecting bristles on one surface thereof and a flexible ring centrally on the other surface thereof, said body portion of the brush being octagonal in form providing opposed straight sides on said body, a handle member for detachable mounting upon the body portion of the brush, said handle member having a flexible yoke end mounted in and snugly engaging said ring, said end including inwardly directed hook flanges engaging two opposed sides of said body which are parallel to said ring in retaining the brush against displacement from said yoke end, and said handle member including an extending handgrip portion.

2,772,435
**CURVED SURFACE WIPER**
Frederick B. Lenk, Los Angeles, Calif.
Application February 24, 1953, Serial No. 338,323
5 Claims. (Cl. 15—245)



5. Curved surface wiper means effectively adapted to wipe a convex surface of varying radii of curvature, comprising: longitudinal resilient wiper blade means; flexible wiper blade holder means provided with lower finger means in gripping relationship with respect to said wiper blade means and provided with upper longitudinal channel means; pressure-applying yoke means in effective cooperable pressure-applying relation to said wiper blade holder means; and biasing tension spring means attached to said yoke means whereby to effectively reactively maintain contact of said wiper blade means with a curved surface, said spring means being in longitudinal contact with said wiper blade holder means and laterally retained by said upper longitudinal channel means of said wiper blade holder means.

2,772,436
**WINDSHIELD WIPER BLADE**
Raymond Dellal, Cheektowaga, N. Y., assignor to Trico Products Corporation, Buffalo, N. Y.
Application January 16, 1953, Serial No. 331,540
10 Claims. (Cl. 15—245)

1. A wiper blade adapted for use on curved window surfaces comprising a rigid primary yoke member having means for attachment to an actuating arm, resilient secondary yoke means including spring-backed levers having a common pivot on said primary yoke member, and an elongated flexible squeegee unit connected at spaced points thereabout to the opposite ends of said primary yoke member and to the ends of said levers.

2,772,437
**SHOE SHINE SERVICE SETS**
Frederick A. Alsen, Chicago, Ill.
Application December 16, 1955, Serial No. 553,524
5 Claims. (Cl. 15—265)

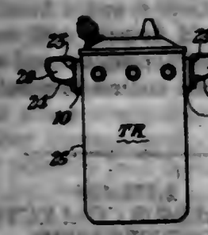
1. A lightweight portable shoe shine box comprising an upstanding housing having an open top and opposed end walls, a frame mounted within said housing for vertical adjustment, a container having bottom and side walls for shoe shine equipment carried by and movable with said frame, a member mounted on and positioned above said frame to serve as a footrest and a handle, resilient latch means on each of said housing end walls to lock said frame in a desired vertical position, and operator-operated means including a single control to simultaneously release said latch means.

2,772,438
**VACUUM DEBRIS COLLECTOR AND INCINERATOR**
Juan Diaz, Baltimore, Md.
Application April 15, 1952, Serial No. 282,364
3 Claims. (Cl. 15—314)

1. A perambulating debris collector comprising a vehicle having means for receiving debris, a roof for said vehicle, a flexible suction pipe above and normally paralleling the roof of the vehicle, a stand pipe connected to one end of the suction pipe and extending within the vehicle, a swivel connection on said stand pipe, means in the vehicle for rotating the portion of the stand pipe connected to the suction pipe, means for bending the front end of the suction pipe towards the debris to be sucked into the vehicle, wherein the means for bending the front end of the suction pipe consist of a winch within the vehicle, means for rotating said winch, and a cable between said winch and the front end of the suction pipe.

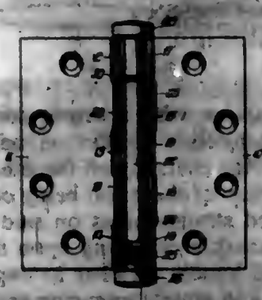
2,772,439
**CONNECTION FOR DOORCHECKS**
Russell C. Flint, Princeton, Ill., assignor to LCN Closers, Inc., Princeton, Ill., a corporation of Illinois
Application March 11, 1955, Serial No. 493,629
10 Claims. (Cl. 16—49)

1. In combination with a door closing and checking mechanism having a shaft, an arm secured to said shaft,



a trackway adapted to be mounted in a recess in a door, and a roller on said arm for movement in said trackway,

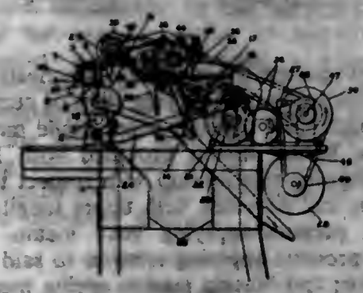
said trackway having dished sides spaced at a distance greater than the diameter of said roller to permit tilting of said roller with respect to said trackway.



---

2,772,440
**MEANS FOR HANDLING ELECTRICAL EQUIPMENT AND THE LIKE**
Robert E. Applegate, Grayson, Ky.
Application November 23, 1955, Serial No. 548,672
2 Claims. (Cl. 16—114)

1. In means for handling an electrical equipment having a single wall metallic outer case for housing electrical apparatus with insulated terminals with weather seals secured in the wall of the case and which equipment is uncrated by purchaser for marking and then handled uncrated at storeroom and at a field installation point, there being no means for taking hold of the case, the combination comprising, a pair of holders each a strip of a steel channel, each said channel with flanges which are welded to the case after the equipment is uncrated and each said holder with the flanges of the channel welded to the equipment case with the web of the channel spaced from the case the width of the flanges, each said holder with the center line of the channel web vertical and the two holders mounted substantially 180 degrees apart on the case and at points on the case selected for the holders to clear the insulated terminals and weather seals, each said holder with two handle eyes in the channel web one above the other a preselected distance, each said handle eye with a circular bottom portion and an upper rectangular portion with vertical edges a preselected distance apart, two metallic handles, each said handle with a face and a hand gripping portion which extends from one end of the face at substantially right angles, a pair of round headed bolts secured in the face of each handle and spaced for the bolts to mate with the spacing of said handle eyes of said holders, each said bolt extending from the face opposite the hand gripping portion with a length of bolt shank slightly greater than the thickness of the channel webs of said holders, each said bolt head of a diameter slightly less than the diameter of said circular portion of said handle eyes, and each said bolt shank of a diameter slightly less than the distance between the edges of said upper portions of said handle eyes.



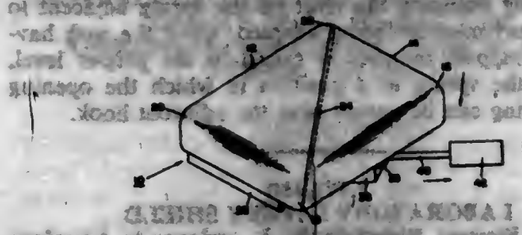
2,772,441
**HINGE**
Clarence B. Rissr, Sterling, Ill., assignor to Lawrence Brothers, Inc., Sterling, Ill., a corporation of Illinois
Application May 13, 1954, Serial No. 429,545
3 Claims. (Cl. 16—169)

1. In a hinge, a pair of hinge leaves formed of sheet material, each of said leaves having a plurality of integral knuckles spaced along one edge thereof, bushings in said knuckles, said knuckles being arranged in interleaved relation with the bushings therein having aligned bores, and a headed pintle engaging in said bores, one of said bushings having an internal peripheral groove in its end which is spaced from the head of the pintle and which faces in the direction opposite the head of the pintle, and a spring-pressed locking member seated in an aperture in the pintle and projecting into the recess in said bushing.

---

2,772,442
**SHELL FISH PROCESSING MACHINE**
Albert J. Matter, Park Ridge, Ill.
Application October 8, 1952, Serial No. 313,756
6 Claims. (Cl. 17—2)

1. In a machine for peeling and deveining shrimp, two like, complete units arranged side by side with corresponding ends facing the same way; each unit including an oscillatory member pivotally supported at its lower end for swinging movements in a vertical plane, a single shrimp holder on such member forming the sole support for a shrimp and being in position for loading at one limit of the oscillatory movements of said member and in delivery position at the other limit of such movements; the planes in which said members move being so near each other that an operator is enabled to load both holders without change of his position; and means to oscillate said members continuously in such out of step relation to each other that only one holder at a time is in the loading position.



---

2,772,443
**SPLIT MOLD**
Morrison L. Robb, Philadelphia, Pa.
Application January 27, 1953, Serial No. 334,421
5 Claims. (Cl. 18—36)

1. A mold for forming objects on the outer surface thereof including a pair of mold sections, the combined mold sections having a polygonal cross-section, the corners of said mold sections being rounded, one of said mold sections being larger than the other, said mold sections being separated along a plane surface angularly

positioned to the vertical at a minor included angle, with said plane of separation being spaced from and on the same side of said diagonal throughout the entire thickness of said mold sections and included within the arc formed by the rounded corners, the larger of said mold sections being provided with means for fixedly securing

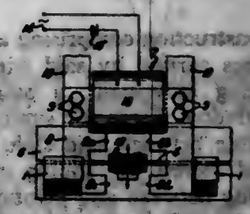
the same to a supporting surface, and the smaller of said mold sections being provided with means for moving said mold section along said supporting surface, whereby said smaller mold section may be raised and lowered on the surface of the larger mold section formed by the plane of separation.

---

2,772,444
**COMPOSITION COMPRISING A POLYHALOGENATED ETHYLENE POLYMER AND VISCOSE AND PROCESS OF SHAPING THE SAME**
Lawton Arthur Burrows, Mendenhall, Pa., and Walter Edwin Jordan, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application August 12, 1954, Serial No. 449,522
22 Claims. (Cl. 18—47.5)

1. A process for the production of a shaped article from a polyhalogenated ethylene polymer which comprises forming an aqueous mixture of viscose and an aqueous stabilized dispersion of said polymer; extruding said mixture into a setting medium for said viscose, forming thereby a structure comprising discrete particles of said polymer and a cellulosic matrix; heating the said structure at a temperature sufficiently high to decompose said cellulosic material; and coalescing the said discrete polymer particles by heating them to effect sintering of the said polymer particles, said aqueous mixture containing about 10% to about 60% of the said polyhalogenated ethylene polymer and about 1% to about 8% of cellulose.

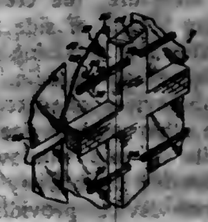
---



2,772,445
**COTTON PICKER**
Arthur L. Hubbard, Maidell, Iowa, assignor to Deere Manufacturing Co., Dubuque, Iowa, a corporation of Iowa
Application May 11, 1953, Serial No. 354,286
18 Claims. (Cl. 19—72)

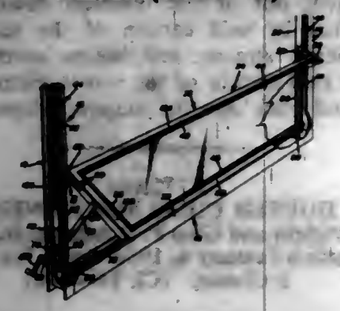
1. In a cotton picker in which conveying means having an outlet discharges a stream of material including picked cotton and incidental trash into a receptacle and against separating screen means spaced from the outlet so that trash normally passes through the screen means and outward of the receptacle and cotton is intercepted and retained in the receptacle, the improvement residing in the screen means, comprising: a plurality of screen elements spaced apart to provide such screen means; means mounting certain of the screen elements for movement out of the material stream to remove the restriction by said certain of the screen elements to the material stream; and means connected to and for moving said certain of the screen elements selectively out of and back into the material stream.

---



2,772,446
**DOFFER COMB MECHANISM**
Walter W. Wright and Glen P. Robinson, Jr., Atlanta, Ga.
Application January 6, 1954, Serial No. 402,543
2 Claims. (Cl. 19—106)

1. In a doffer comb mechanism, a comb member, and means for supporting and oscillating said comb member in predetermined relation to the card clothing of a carding machine, including flexible arm means for mounting said comb member in spaced relation to a fixed support, and electromagnetic means for imparting vibratory oscillation to said arm means and therethrough to said comb member, said electromagnetic means including a core having two pairs of pole pieces arranged in spaced confronting relation, an armature carried by said arm means in the space between and flanked by said pairs of pole pieces for movement in alternation in the direction of each pair of pole pieces from a neutral position therebetween, a coil on said core, circuit means for connecting said coil to a source of alternating current having a frequency of the order of sixty cycles per second and a half-wave rectifier connected in said circuit, the movable assembly comprising said arm, armature and comb member having a mechanical resonant frequency higher than thirty cycles per second and an operational frequency of one-half that of said source of alternating current.

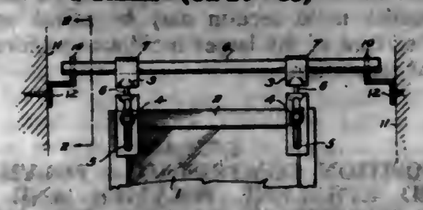


---

2,772,447
**CLOSURE DEVICE FOR OPENINGS IN BUILDINGS**
Carl G. Preston, Chicago, Ill., assignor of fifty percent to Robert P. Brunemann, Chicago, Ill.
Application January 5, 1955, Serial No. 479,885
9 Claims. (Cl. 20—40)

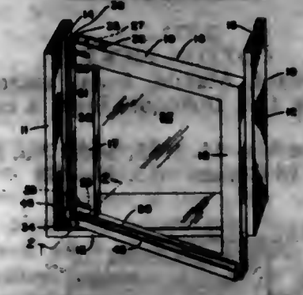
1. In a closure device of the character described; the combination of a panel for closing an opening in a wall, said panel positioned with the marginal edges thereof abutting the outer surface of the marginal edges of the wall defining said opening, a brace-bar positioned with its ends abutting the inner surface of the marginal edges of the wall defining said opening, and removable means for adjustably connecting said panel and brace-bar in clamping arrangement with said wall.

2,772,448
**WINDOW CONSTRUCTION**
Arthur J. Cole, Clearwater, Fla.
Application December 31, 1953, Serial No. 401,589
6 Claims. (Cl. 20—62)



1. A window construction comprising a window frame, a plurality of sashes carried by said window frame for sliding and swinging movement, a pair of slide bars mounted in said window frame for simultaneous sliding, said sashes extending between said slide bars and being pivotally connected thereto for sliding movement therewith, arms extending between and pivotally connected at opposite ends to said sashes and said window frame, and operating means carried by said window frame for actuating at least one of said slide bars, said operating means including a block carried by said one slide bar, said block having a bore therethrough, an operating shaft extending less than the height of said frame and received in said bore, cooperating means on said shaft and in said bore to cause movement of said block along said shaft in response to rotation of said shaft, means for selectively rotating said shaft to impart a sliding movement to said slide bars.

2,772,449
**REMOVABLE SASH WINDOW UNIT**
Frank S. Nicoll, Jr., Baltimore, Md.
Application December 31, 1954, Serial No. 479,081
3 Claims. (Cl. 20—52.2)



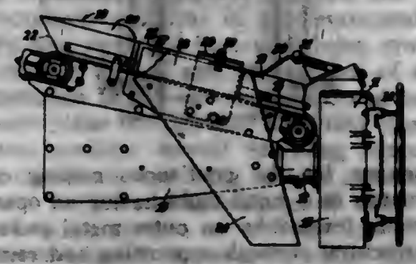
1. In a window structure, the combination, with a window frame having a pair of side stiles, of a set of sashes and means removably retaining said sashes in said frame for vertical movement therein; said means comprising a pair of jamb devices, one fixedly secured to one of said stiles and the other jamb device floatingly mounted on the other stile of said window frame, resilient means urging said floating jamb away from said second stile, each of said jamb devices providing guide channels for the oppositely disposed stiles of each sash, a stiffener plate secured to the upper rear portion of said floating jamb, a set of hooks located one in each guide channel of said floating jamb and extending through the latter and secured to said stiffener plate, said stiffener plate having a set of tongues integral therewith and projecting through said floating jamb one each into one of said guide channels of the floating jamb, each sash having a channel facing said floating jamb, a set of counterbalance springs for suspending said sashes at desired elevations in said window frame, means in the channel of each sash securing to the latter one end of a counterbalance spring, a rivet secured to each of said springs adjacent to the upper end thereof, a support member located at the upper end of the channel in each sash and having an end engageable with one of said rivets, an opening in each counterbalance spring above such rivet, each support member by engaging the rivet on the spring adjacent to said support member being adapted, when the sash having said support member is raised to the proper level, to carry the spring to a position in which the opening in the spring can be passed over the adjacent hook.

2,772,450
**LABORATORY SAFETY SHIELD**
Hugh W. Stewart, Plainfield, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine
Application September 30, 1953, Serial No. 383,197
1 Claim. (Cl. 20—63)

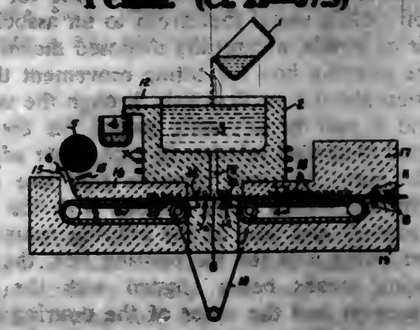
A safety shield, comprising in combination, a sheet of transparent shatter resistant material encased in a frame, a horizontal bar and sole suspending means to suspend said frame from said horizontal bar, said sole suspending means comprising two separate open end inverted U-shaped members, said U-shaped members overlying said horizontal bar, the other end of each of said U-shaped members having a longitudinal slot, means passing through said slot and said frame fastening the frame to the sole suspending means; a swivel joint located between said open end members and said frame; said horizontal bar resting in a pair of notched brackets, said notched brackets being fixed to side supports, whereby said sheet is free-swinging from said horizontal bar.

2,772,451
**REMOVABLE WINDOW SASH**
Wade D. Lake, Akron, Ohio
Application June 10, 1954, Serial No. 435,686
4 Claims. (Cl. 20—64)

1. A slidable sash for use in a casing having opposed grooves in its opposite side members for confining the sash in sliding engagement, said sash being of less width than the distance between the bottom of one of the grooves and the inner face of the opposite casing adjacent its groove and of greater width than the distance between ungrooved portions of both the side casings adjacent said grooves, the edge face of one side rail of said sash having a clearance groove of less width than the thickness of the sash extending throughout its length, and a displaceable bearing member resiliently mounted in said groove for movement toward and away from said side rail and concealed from the face of the sash when the sash is in place by face portions of the sash rail to permit entry of the sash in the opposing groove of the casing by swinging movement of the sash about one edge thereof entered in one of said grooves.

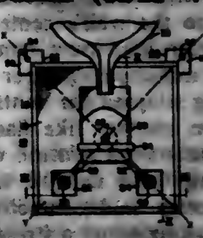


2,772,452
**MOVABLE GUARD STRUCTURE FOR WINDOWS**
Edward S. Mathes, Glendale, Calif.
Application December 30, 1955, Serial No. 556,614
2 Claims. (Cl. 20—71)



1. In a window assembly, a frame comprising a horizontal sill, respective vertical side members secured to opposite ends of said sill and a horizontal top member secured to the top ends of said side members, respective sash members having horizontal top and bottom portions and vertical opposite side portions slidably mounted in said frame, a plurality of spaced depending parallel bars secured to the horizontal lower portion of one of said sash members and extending slidably through said sill, a horizontal bar member slidably engaged with said depending bars, and abutment elements on the intermediate portions of said depending bars formed and arranged to at times support said horizontal bar member in a position intermediate said sill and said last-named horizontal bottom portion of the sash member.

2,772,453
**FOUNDRY MOULDING APPARATUS**
Austin Sidney Beech, Leighton Buzzard, England, assignor to Foundry Equipment Limited, Leighton Buzzard, England, a British company
Application March 15, 1954, Serial No. 416,306
Claims priority, application Great Britain March 16, 1953
2 Claims. (Cl. 22—36)



1. A foundry sand-ramming machine comprising in combination a carrier-arm supported for universal horizontal movement, a ramming-head mounted thereon and comprising an impeller and means for rotating the same, a belt conveyor on the carrier-arm delivering into the ramming head, a chute fixed on the carrier arm beside the conveyor and having a downwardly directed opening close to the ramming head, guide walls along each side of the conveyor belt to keep sand in place thereon and a movable section in one of said side walls pivoted so that it can be swung obliquely across the conveyor belt to direct sand therefrom into the chute.

2,772,454
**APPARATUS FOR CASTING**
Joseph B. Brennan, Cleveland, Ohio
Original application June 4, 1949, Serial No. 97,195. Divided and this application May 28, 1952, Serial No. 293,184
1 Claim. (Cl. 22—57.3)

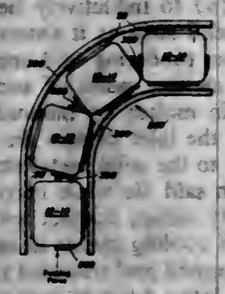
Casting apparatus for continuously producing composite strip metal, comprising a longitudinally extending fluid-cooled ceramic die including a stationary wall and a longitudinally movable wall which are laterally spaced apart a distance corresponding to the thickness of the composite strip which it is desired to produce, means for moving said movable wall, said die having an inlet at one end for solid strip metal and molten metal of lower melting point than the strip metal and an outlet at the other end for emergence of composite strip metal composed of solidified molten metal united to the strip metal, means for conducting a solid metal strip through said die with one side in contact with said movable wall for movement of the strip in synchronism therewith in substantially unstressed condition and with the opposite, exposed side laterally spaced from said stationary wall, molten metal supply means having a discharge opening leading into the inlet of said die for flow of molten metal therethrough in contact with such opposite side of the solid metal strip and with said stationary wall for emergence from the outlet in solidified condition, and induction heating means along said die having a heating field effective (*a*) to inductively heat such opposite side of the solid metal strip as it enters the inlet of said die to a temperature rendering said opposite side plastic and exceeding the melting point of such molten metal, and (*b*) to maintain molten by induced current said molten metal adjacent the inlet of said die whereby said molten metal is united to the solid metal strip, and is hot-formed and troweled in said die while carried by the strip metal in longitudinally sliding contact with the stationary wall of said die, and cooling means in said die extracting heat from the hot-formed and troweled molten metal at a rate to solidify the latter prior to emergence from the outlet of said die.

2,772,455
**METAL POURING APPARATUS FOR CONTINUOUS CASTING**
Rufus Kaiser, Pittsburgh, Pa., and Thomas Y. Wilson, Albany, N. Y., assignors to Allegheny Ludlum Steel Corporation, Brackenridge, Pa., a corporation of Pennsylvania
Application October 28, 1955, Serial No. 543,323
6 Claims. (Cl. 22—79)

1. In apparatus for controlling the simultaneous pouring of molten metal into a pair of molds, the combination

comprising, a pouring box having a main reservoir and a pair of spaced pouring reservoirs adjacent one end thereof for receiving and holding molten metal, a pair of spaced pouring spouts for connecting the main reservoir with each of the pouring reservoirs, each of the pouring reservoirs having a pouring nozzle for directing the flow of molten metal therefrom to an associated one of the pair of molds, a centrally disposed means for supporting the pouring box for tilting movement thereof in any direction about a vertical axis through the supporting means, and a pair of adjusting means for the pouring box disposed in spaced relation to each other adjacent an end of the main reservoir opposite said one end, one of the adjusting means being aligned with the centrally disposed support and one of the pouring spouts to provide a first tilting axis for the pouring box, the other of the adjusting means being aligned with the centrally disposed support and the other of the pouring spouts to provide a second tilting axis for the pouring box, each of the adjusting means being disposed for independent operation to selectively control the tilting movement of the pouring box about the first or second tilting axis to provide a selective control of the flow of molten metal from the main reservoir through a predetermined one of the pouring spouts without affecting the flow of molten metal through the other of the pouring spouts to thereby selectively control the rate of flow of molten metal from each of the pouring reservoirs to the associated molds.

---



2,772,456

## FOUNDRY MOLD FLASKS WITH NOVEL END BUMPER MEANS

John A. Lanster and Thomas A. Dunkins, Chattanooga, Tenn., assignors to Combustion Engineering, Inc., New York, N. Y., a corporation of Delaware

Original application August 25, 1951, Serial No. 243,688. Divided and this application March 31, 1955, Serial No. 498,336

2 Claims. (Cl. 22—96)

1. In a mold flask adapted for use as a drag or as a cope and comprising a frame portion made up of two side walls interconnected by forward and rear end walls at least one of which end walls has a fitting protruding outwardly from about the center thereof, the combination of a bumper fixed to each of said end walls and protruding from the outer face thereof by at least the protrusion distance of the aforesaid fitting, each of said forward and rear end bumpers being located in side-displaced relation to the wall's central fitting and being curvedly tapered from maximum bumper depth adjacent the flask center to minimum bumper depth adjacent the flask side and being adapted for contact with the adjoining end bumper on another like flask when that other flask is placed in end-to-end relation with the first whereby endwise pushing force can be transmitted between the two flasks through said contacting bumpers during travel of the flasks along either a straight or a curved path without dependence on or interference with the said central fittings of the adjoining flask ends.

2,772,457

## METHOD OF SHELL MOLDING

Fred J. Webbere, Royal Oak, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

No Drawing. Application May 9, 1952, Serial No. 287,635

11 Claims. (Cl. 22—193)

4. A method of increasing the permeability of a shell mold having a thermosetting resin binder which comprises reducing said binder to an essentially high carbon material without the formation of carbon dioxide with the atmosphere by subjecting said mold to a baking operation under a non-oxidizing atmosphere for ¼ hour to 1½ hours at a temperature up to 1400° F. to drive substantially all the volatile constituents therefrom.

---

2,772,458

## METHOD OF MAKING SMOOTH-SURFACED SAND-RESIN MOLDS

Donald J. Henry, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

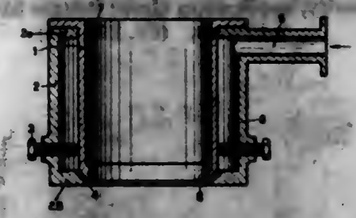
No Drawing. Application May 29, 1951, Serial No. 228,996

1 Claim. (Cl. 22—193)

The process for forming a mold-layer shell-type sand-resin mold which comprises forming a dry mixture of coarse and fine refractory fillers and a thermosetting resin binder wherein said refractory fillers consist of approximately 85% to 95% by weight of a silica sand of substantially uniform particle size and 5% to 15% by weight of silica flour, said binder constituting 4% to 20% of the total weight of the molding mixture, placing the mixture in contact with a hot metal pattern and permitting such contact for an interval sufficient to melt and set the resin binder, removing any excess sand and silica flour, and curing the formed mold shell by heating while in contact with the metal pattern.

---

2,772,459



## CONTINUOUS CASTING OF METALS

Hans Wieland, Ulm (Danube), Germany, assignor to Wieland Werke A. G., Ulm (Danube), Germany, a corporation of Germany

Application July 10, 1951, Serial No. 236,987

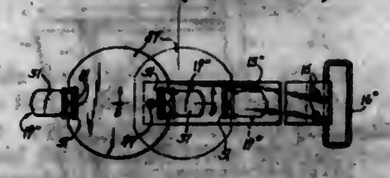
Claims priority, application Switzerland July 21, 1950

1 Claim. (Cl. 22—200.1)

The process for the continuous casting of oxygen bearing metals in a metal mold having an open top and open bottom, formed by an outer metal jacket of substantial structural strength supporting and reinforcing a relatively thin graphite liner having a thickness such that the inner surface thereof is coolable below a liner reactive temperature of about 600° C. during casting, said mold being unconnected with the container holding the source of metal so that the molten metal in the mold can have its own free surface, said method comprising pouring molten metal into the open top, cooling said jacket and withdrawing the congealed metal from the open bottom, the fit of the liner in the jacket and the thickness of the liner being such that the mold extracts heat from the congealing metal through the liner substantially as intensively as an oil-coated lubricated mold would extract heat, said pouring, cooling and withdrawing being at such rate that a free surface of molten metal

is maintained in said mold, and the upper edge of the congealing crater shell is maintained in close proximity to said free surface, and the crater shell is of considerable depth, but of such thickness as not to break through at the lower edge of the mold.

---



2,772,460

## CLAMPING STRAP FOR BLANKETS

Josefina Berkowicz, New York, and Rosy Turcano, Bronx, N. Y.

Application July 20, 1953, Serial No. 368,964

2 Claims. (Cl. 24—72.5)

1. A blanket holder for a child's crib comprising an elongated plastic strap, a ring swingably supported at one end thereof, a clamping device pivotally connected to the opposite end of said strap, said clamping device being mounted for rotation in a plane parallel to the plane of the body of the strap, said clamping device including a substantially circular plate having opposed cutaway flat portions, said plate having elongated slots closely spaced from the flat portions and being disposed parallel thereto, the pivotal connection between said plate and strap being positioned close to one of said slots, and clamps hingedly connected to the material of the circular plate between the slots and flat portions thereof and extending through said slots and radially beyond said flat portions, whereby upon rotation of the circular plate the effective length of the holder may be varied.

---

2,772,461

## COLLAR BUTTONS

Norman P. St. John, Arlington, Va.

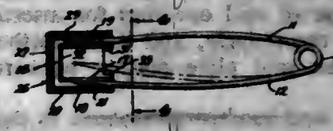
Application November 27, 1953, Serial No. 394,628

1 Claim. (Cl. 24—101)

A collar button comprising a top, base, and connecting stem, the greatest horizontal section of the top, and base being substantially elliptical in shape, and the stem being substantially elliptical in any horizontal section thereof, the top, stem and base each being symmetrical about a common vertical axis, the greatest of the horizontal dimensions of the said top, stem, and base lying in a common plane through said axis, said stem having one or more portions thereof extending symmetrically outwardly therefrom, and lying in said common plane, each of said portions being adapted to coact with an adjacent extending portion or with the top or base to form a groove adapted to prevent a collar button from sliding out of a button hole in which said collar button is inserted, the width or dimension of the stem in a plane at right angles to said common vertical plane increasing from the end of the stem near the top to the end of the stem near the base.

---

2,772,462



## SAFETY PIN

Fred A. Trechsler, Vallejo, Calif.

Application January 26, 1954, Serial No. 405,788

3 Claims. (Cl. 24—189)

1. In a safety pin, a resilient wire formed in a bight and having two normally diverging arms extending toward the end of said pin opposite said bight, the first of said arms being pointed, a head permanently engaging the second of said arms, said head being U-shaped and comprising a first and a second parallel leg and an intermediate connecting leg, said first leg secured rigidly to said second arm coaxially therewith at the end thereof opposite the bight, said second leg being hollow and formed with a slot extending inward from its end fac-

ing said first leg to a depth sufficient to receive said pointed end of said first arm within said slot, a hollow shell guard slidably fitting over said head and having its open end facing said bight and having a depth substantially equal to the length of said head, and means to prevent slidable disengagement of said shield guard from said first leg.

---

2,772,463

## SEPARABLE FASTENER

Jerome Alfred Schauer, Fresh Meadows, N. Y.

Application June 21, 1952, Serial No. 294,831

7 Claims. (Cl. 24—227)

5. The combination with a belt and a buckle at one end of said belt of a separable fastener for securing the other end of said belt in place after being passed through said buckle, said separable fastener including a hook member on the inner face of said belt adjacent said other end, and an eye member detachably receiving said hook member and longitudinally adjustable along said belt toward and away from said buckle, said eye member including a flat piece arranged in coplanar relation and slidable along the under surface of said belt, a flat cross bar offset forwardly from said piece and cooperating therewith to form a belt-receiving channel, and piercing means on said flat piece and engageable in the under surface of said belt for securing said eye member in an adjusted position, whereby upon the hook member being received in said eye member, the free end of said belt is maintained against movement.

---

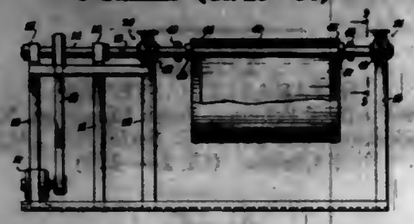
2,772,464

## EYE FOR HOOK AND EYE

Anthony Davies, Los Angeles, Calif.

Application June 13, 1952, Serial No. 293,357

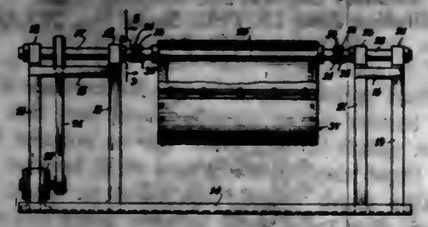
5 Claims. (Cl. 24—227)



1. An eye for a hook and eye, said eye comprising a plate sheet metal portion of generally rectangular shape having offsets corresponding to the thickness thereof, said offsets being formed on opposite ends of said plate portion and in the same direction, said plate portion being formed at said offsets with openings therethrough, said openings extending through said offsets and toward

the ends of said plate a distance approximately equal to the thickness of the material thereof, an eye forming medial portion and shanks at opposite ends thereof disposed at right angles thereto, said shanks terminating in hooks having barb portions disposed at an angle relative to the body of said shanks respectively, and the barbs associated with the respective shanks being in opposed flared relationship relative to one another, the angle of said flare conforming to the angle of said openings for insertion through said openings respectively, and being further bent and flattened against said plate portion outwardly of said offset.

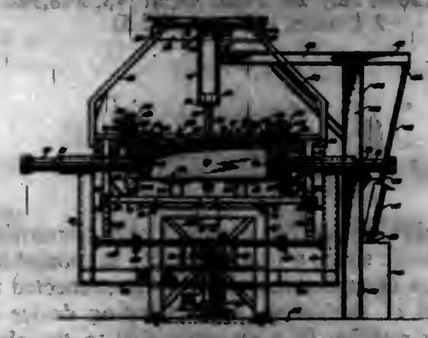
---



2,772,465
APPARATUS FOR FORMING A HOLLOW BODY OF CONCRETE OR THE LIKE
Hendrik B. Van Rensselaer, Summit, N. J., assignor to Lock Joint Pipe Company, East Orange, N. J., a corporation of New Jersey
Application November 12, 1953, Serial No. 391,414
5 Claims. (Cl. 25—39)

1. Apparatus for forming a hollow body of concrete or the like, comprising a hollow rotary mould having spaced-apart annular members extending radially inwardly of the outer moulding surface of said mould, means rotatably supporting said mould, said supporting means comprising a plurality of separate shafts of which one of the shafts constitutes a roller for suspending said mould, said roller shaft threaded through said mould and extending beyond the ends of said mould, bearing means rotatably supporting said shafts in alignment on a common axis, and radially engageable and disengageable coupling means for engaging said shafts for concomitant rotation thereof, said coupling means constructed and arranged for permitting disengagement of said roller shaft and the moving of said roller shaft radially outwardly from said common axis so as to enable said mould to be carried on the roller shaft laterally away from said bearing means.

---



2,772,466
APPARATUS FOR FORMING A HOLLOW BODY OF CONCRETE OR THE LIKE
Hendrik B. Van Rensselaer, Summit, N. J., assignor to Lock Joint Pipe Company, East Orange, N. J., a corporation of New Jersey
Application November 12, 1953, Serial No. 391,415
5 Claims. (Cl. 25—39)

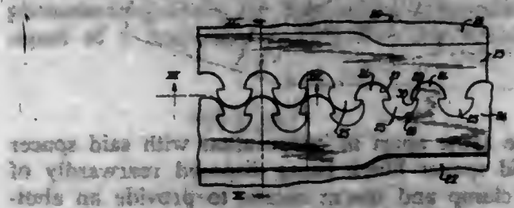
1. Apparatus for forming a hollow body of concrete or the like comprising a hollow rotary mould having spaced-apart annular members extending radially inwardly of the outer moulding surface of said mould, a roller shaft for suspending said mould, said roller shaft extending through said mould and beyond the ends of said mould, means for rotatably supporting said roller shaft, said supporting means comprising a rotatably supported shaft adjacent each end of said roller shaft, means preventing axial movement of said shafts which are adjacent the ends of said roller shaft, and means for engaging the ends of said shafts with said roller shaft.

---

2,772,467
MOLDING APPARATUS
Paul M. Mangravite, Kingston, Pa.
Application August 6, 1951, Serial No. 240,693
16 Claims. (Cl. 25—41)

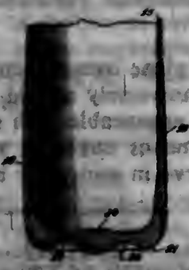
1. Molding apparatus especially useful in forming concrete products comprising a pallet, supporting means for said pallet, a pair of sidewalls and endwalls for cooperation with said pallet to form a casting chamber; means for effecting movement of said side and endwalls to and from a cooperative position with said pallet; a top closure for said casting chamber; means for delivering pressure to said casting chamber to effect compression of its contents; means for effecting vertical movement of said side and endwalls from a position of cooperation with said pallet; supporting means for said pressure means independent of said pallet supporting means; said pressure means having a thrust transferring system associated therewith independent of said supporting means for said pressure means for transferring upward thrust from said pressure means; said thrust transfer system including at least one extending member attached to said pressure means; and means removed from said pressure means for holding said member against upward movement.

---



2,772,468
DOWEL BAR OR TIE BAR SUPPORTING SIDE FORMS
John N. Holland, Warren, Ohio; The Union Savings & Trust Company, Warren, Ohio, and Carl J. Holland, executors of said John N. Holland, deceased
Application June 16, 1951, Serial No. 231,981
10 Claims. (Cl. 25—118)

1. A dowel bar supporting form comprising a side form having a vertical web, a grooving strip, a tubular member securing said strip to said web, said tubular member having a smooth through bore for receiving therethrough a dowel bar, and a support carried by said form and having a through passageway in alignment with the bore of said tubular member for receiving therethrough the dowel bar.



2,772,469
SLIDE FASTENER
Karel Jan Stalkus, Pittsburgh, Ohio, and Emil F. Sysz, New York, N. Y.
Application February 8, 1952, Serial No. 270,681
3 Claims. (Cl. 24—204)

1. A slide fastener comprising: a pair of releasably engageable flexible members having integral interlocking projections spaced along adjoining marginal portions thereof, said projections having enlarged outer portions defining interengaging inwardly facing surfaces with alternate projections having surface portions oppositely inclined with respect to a line normal to a plane through and in the direction of said projections to limit relative movement of said members in any and all directions.

---

2,772,470
METALLIC CARTRIDGE CASINGS
George Albert Lyon, Detroit, Mich.
Application December 17, 1951, Serial No. 262,060
3 Claims. (Cl. 29—1.3)

2. A method of making cartridge shell casings which comprises shaping a metal blank into a partially formed casing comprising an elongated tubular side wall and a thickened concave convex bottom wall of substantially uniform inner and outer curvate faces, and coining the bottom wall into substantially flattened condition and forming a thickened central button bulge and an annular outer marginal downwardly projecting thickened bottom rib by displacing material from an annular intermediate bottom face area partially inwardly to form the central bulge said partially outwardly to form the rib.

---

2,772,471
ABRADING TOOLS
Arnold Sydney Long, Bilbrook, Staffordshire, England
Application August 23, 1954, Serial No. 529,777
Claims priority, application Great Britain September 24, 1954
4 Claims. (Cl. 29—79)

1. An abrading tool comprising a handle having a flat face across which extends a longitudinally bowed abrasive strip consisting of a plurality of peripherally toothed substantially parallel resilient wires transversely bent to sinuous form.

---

2,772,472
ATTACHMENT OF PIN STEM FINDING TO AN ORNAMENT
Frederick A. Ballou, Jr., Providence, R. I., assignor to R. A. Ballou & Co. Incorporated, a corporation of Rhode Island
Application June 24, 1954, Serial No. 439,029
1 Claim. (Cl. 29—160.6)

The method of connecting without heat pin stem findings to an ornament comprising providing each of two co-operating findings with an out of round base of a size larger than the pin stem engaging part thereof, recessing said ornament at two locations in a shape corresponding to the shape of said base with said recesses oriented to align said findings bases for cooperation with each other for functioning together, positioning said bases of said findings in said recesses, and staking the stock about the recesses over the outer surface of the finding bases.

---

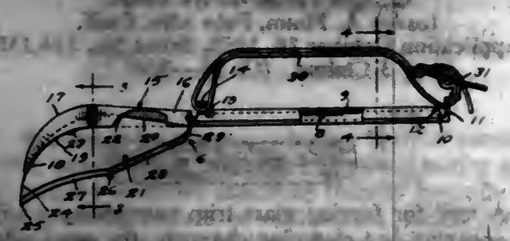
2,772,473
GLASS TRIMMING TOOL
Joseph A. Pfann, Palo Alto, Calif.
Application October 10, 1952, Serial No. 314,113
3 Claims. (Cl. 29—258)

3. A tool for forcing glass trim comprising a pair of glass engaging and clamping channels, the open sides of which form ways, said channels being placed with their ways opposed and longitudinally coextensive, two adjacent ends of said channels being grip ends and the other two ends being formed as cam follower ends, means positioned intermediate the ends of and pivotally connecting said channels in laterally spaced relationship, each channel having adjacent its grip end a grip pad pivotally secured thereto so that a face of each pad is opposed to a face of the other, a work-engaging head positioned between and guided by said ways for movement longitudinally thereof while being restrained by said ways from rotation, a screw positioned longitudinally between said ways with one end secured to and swiveled in said head and the other end extending between and outwardly beyond said cam follower ends, and nut means having cam surfaces for engagement with said cam follower ends and restrained from rotation relative to said channels while said surfaces are so engaged, said nut means being threadedly carried by said screw to be moved axially along said screw upon rotation thereof so that said cam surfaces engage and move outwardly said cam follower ends thereby forcing said pads together to grip the glass positioned therebetween, and said head and screw being slidable as a unit longitudinally of said ways to permit said head to apply a force to the trim while the glass is gripped by said pads.

---

2,772,474
CARPET TRIMMER
Harvey J. Hill, Monterey Park, and Jack W. Petty, Los Angeles, Calif., assignors to Roberts Manufacturing Co., Los Angeles, Calif., a corporation of California
Application May 4, 1953, Serial No. 352,906
9 Claims. (Cl. 30—303)

1. In a device for cutting a carpet laid on the floor of a room, the combination of: a base engageable with the upper surface of the carpet and movable therealong in a first horizontal direction; carpet cutting means including a blade holder and a blade carried thereby; a locating



member for said blade holder; vertical adjustment means for rigidly supporting said blade holder and said locating member on said base in any one of a plurality of vertical positions relative to said base; and horizontal adjustment means for rigidly supporting said blade holder in any

one of a series of horizontal positions relative to said base extending in a second horizontal direction perpendicular to said first horizontal direction, including interengageable detent means on said blade holder and said locating member.

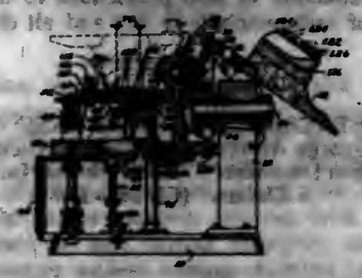
---

2,772,475
**GRAPEVINE AND TWINE CUTTING KNIFE**
Robert F. McConnell, Parlier, Calif.
Application August 6, 1954, Serial No. 448,314
4 Claims. (Cl. 30—296)

1. A knife of the character described adapted to be attached to and supported on the fingers, comprising an elongated body portion having a rear end forming a handle, said handle being provided with upstanding strap engaging portions adjacent the ends thereof, an adjustable strap connected to and extending between said strap engaging portions and disposed over the handle and lengthwise thereof, the other end of said body portion comprising an elongated blade supporting head, said head having an underside provided with a groove extending substantially from end-to-end thereof and opening outwardly of said underside, a cutting blade having a back edge portion snugly fitting in said groove, means securing said blade to the head, and said blade having a sharpened bottom edge extending substantially from end-to-end thereof and disposed beneath and spaced from the underside of said head, said head having an inner end merging with the forward inner end of the handle and of a thickness substantially greater than the thickness of said handle, said head diminishing in width from the handle to a point substantially intermediate of its ends and increasing in thickness in a direction away from the handle, said aforementioned inner end of the head forming a substantially straight extension of the handle, the other outer end of said head being relatively narrow and being curved outwardly and downwardly relative to the inner end of the head and having a tapered outer end portion.

---

2,772,476
**VARIABLE GRIP AND ADJUSTABLE MULTIPLE FUR SLICER**
Jack Glatzer, New York, N. Y.
Application March 3, 1954, Serial No. 413,936
7 Claims. (Cl. 30—304)



1. A fur slicing hand tool of the multiple blade type comprising a pair of connected side plates spaced apart for at least part of their lengths, blade clamp means, means supporting said blade clamp means on said plates in the space therebetween, a blade retained between said clamp means, spacer means secured on said plates to dispose the blade clamp means a selected distance apart, and a spacer block secured to one of said side plates for

spacing the same apart in cooperation with said spacer means, said spacer block being disposed rearwardly of the blade clamp and spacer means to provide an abutment therefor and for said blade engaged by the blade clamp means.

---

2,772,477
**OCCLUSAL PLANE RECORDER**
James S. Miller, Trenton, N. J.
Application December 24, 1952, Serial No. 327,723
15 Claims. (Cl. 32—32)

1. An occlusal plane recorder comprising, in combination, a pair of transversely spaced elongated supports, a flat resilient plate engageable with said supports and vertically movable means engaging said plate to effect a predetermined curve in said plate between said supports.

---

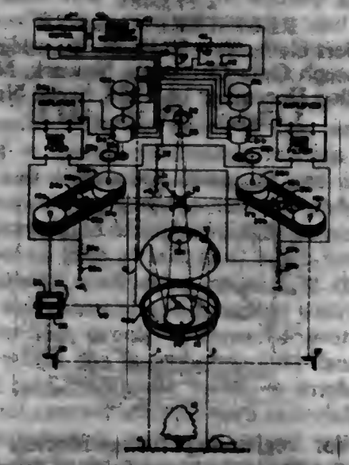
2,772,478
**DENTAL PROPHYLACTIC AND HYGIENIC INSTRUMENT**
Edward J. Hatford, Fresno, Calif.
Application December 16, 1954, Serial No. 475,743
3 Claims. (Cl. 32—30)

1. An oral prophylactic instrument comprising a ring adapted for finger wear and rotatable positioning thereon, a tooth cleaning member of substantially uniform width outwardly extended from the ring having a scraping edge, and a tapered tooth cleaning member outwardly extended from the ring diametrically of the tooth cleaning member of uniform width and providing a cleaning point, the cleaning members each providing finger engaging surfaces disposed in the same direction circumferentially of the ring adapted for alternate finger engagement to restrain the ring against rotation.

---

2,772,479
**APPARENT-VELOCITY RESPONSIVE SYSTEM**
Irving W. Doyle, Massapequa, N. Y., assignor to Fairchild Camera and Instrument Corporation, a corporation of Delaware
Application June 14, 1948, Serial No. 515,364
13 Claims. (Cl. 33—65.5)

1. A system responsive to the apparent velocity of a relatively moving object over a predetermined range of velocities comprising: optical means for forming at a focal plane an image of the relatively moving object; an elongated translucent strip having an opaque transverse repetitive pattern disposed substantially in said focal plane and movable thereby in the direction of image motion; motor means for continuously driving said strip; photoelectric means for developing a periodic electrical signal of a frequency varying with the velocity of the



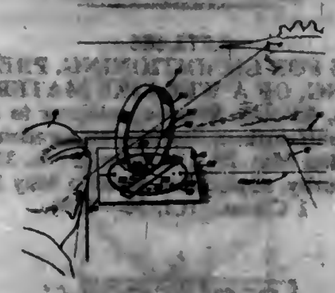


image at the focal plane relative to said repetitive pattern; circuit means responsive to said electrical signal for regulating the speed of said motor means in a sense to reduce the range of frequency variation of said signal as the apparent velocity of the object varies over said predetermined range; and means responsive to the frequency of said signal for developing an effect representative of the apparent image velocity.

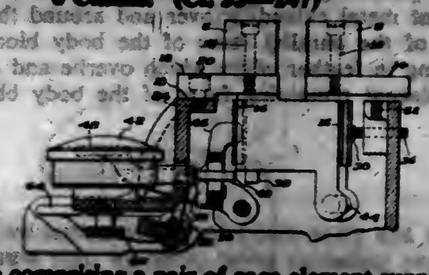
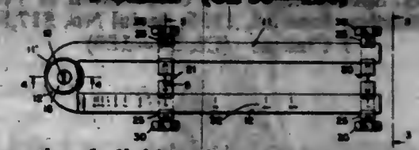


---

2,772,480
**PELORUS PROTRACTOR**
Albert S. Vrana, Northport, N. Y.
Application August 16, 1955, Serial No. 528,641
3 Claims. (Cl. 33—67)

1. A position locating device comprising a support base including a circular scale thereon from 0 through 360°, said base including a straight line index thereon extending diametrically through the center of the circular scale to opposite edge portions of said base for permitting said base to be aligned with a reference line representing a known direction on a chart, a pivot axis element at the center of said circular scale, and a pivotal loop pelorus including a circular element pivotally supported on the pivot axis element normal to said support base, said pelorus loop including a side edge portion for alignment with a fixed visible point angularly removed from the moving body upon which a sighting may be made with said pelorus loop, said pelorus loop further including a straight edge base portion intersecting the circular scale and parallel with the support base and constituting a straight edge linear projection of the line of sight contained in a vertical plane extending through the side edge portion of said loop and the base portion of said loop.

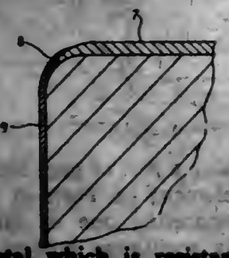


2,772,481
**GAGE HAVING DAMPED GAGING MOVEMENT**
Paul A. Gosney, Springfield, Vt., assignor to Bryant Chucking Grinder Company, Springfield, Vt., a corporation of Vermont
Application September 17, 1953, Serial No. 380,585
6 Claims. (Cl. 33—147)

1. A gage comprising a pair of gage element supporting members, a gage element on each of said supporting members, means supporting one of said members for yielding substantially rectilinear motion relative to the other of said members in a direction to move said gage elements toward and away from one another to open and close said gage elements, damping means connecting said supporting members, said damping means comprising a flexible member of a material having high temporary set characteristics to provide a low recovery rate when said supporting members are displaced from gaging position, and indicating means responsive to the relative displacement of said supporting members.

---

2,772,482
**PROPORTIONAL DIVIDERS**
Maurice E. Downs, Huntington Park, Calif.
Application October 6, 1953, Serial No. 384,484
1 Claim. (Cl. 33—159)



A proportional dividers instrument comprising a pair of legs each having a straight main portion and a laterally projecting end portion, means pivotally connecting said end portions for movement of the legs substantially in a common plane, the pivotal axis being laterally offset from the inner sides of the legs whereby said legs may be disposed in parallel, spaced relation, a pin-holding block slidably mounted on the main portion of each leg, interengaging means on the block and leg preventing rotation of the block about the leg, means in each block for engaging the leg upon which the block is mounted for releasably holding the block in a given position on the leg, a pin in each block, the pin in each block projecting in a plane at right angles to the leg and disposed angularly inwardly of the leg at an angle of less than 90° to the plane of movement of the leg, and a pin mounted adjacent the free end of each leg, said last-mentioned pins projecting respectively corresponding to said first-mentioned pins, all of said pins projecting to one side of the instrument, said pins being so disposed that their outer ends are substantially in alignment midway between the legs on a line passing through the pivotal axis of the legs when the legs are parallel.

---

2,772,483
**COMPOSITE GAGE BLOCK**
Raymond A. Gierlich, Shakopee, Minn., assignor to Continental Machines, Inc., Savage, Minn., a corporation of Minnesota
Application May 12, 1955, Serial No. 507,935
3 Claims. (Cl. 33—169)

3. A gage block comprising: a body block of metal having a predetermined hardness, said body block having

a pair of opposite substantially parallel faces; a thin layer of wear resistant metal considerably harder than the metal of which the body block is formed overlying and bonded to each of said substantially parallel faces of the body block and finished to accurate flatness and parallelism to provide gaging surfaces, said layers of hard, wear resistant metal extending over and around the marginal edges of the parallel faces of the body block and terminating in feather edges which overlie and merge with the adjacent remaining faces of the body block; and a

plating of a metal which is resistant to common corrosive substances overlying said remaining faces of the body block and overlapping the adjacent feather edge portions of said hard wear resistant layers, but without extending over the gaging surfaces thereof, so that said corrosive resistant plating covers and seals the junction between the feather edges of said layers of hard wear resistant metal and the body block to prevent entry of corrosive substances between the body block and said layers of hard wear resistant metal.

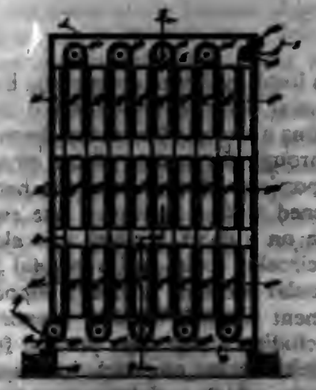
**SQUARENESS-OF-FACE GAGE**
Jeffrey M. Cargill, Weathersfield Bow, and Hugh M. Taft, Springfield, Vt., assignors to Bryant Chucking Grinder Company, Springfield, Vt., a corporation of Vermont
Application June 24, 1955, Serial No. 517,862
7 Claims. (Cl. 33—180)

1. A squareness-of-face gage for workpieces having a threaded cylindrical surface and an end surface perpendicular thereto comprising a pair of relatively movable thread gage support members, an upstanding thread gage element mounted on each of said support members for movement toward and away from one another for engagement with the threaded cylindrical surface of a workpiece, a squareness-of-face gage element support mounted on one of said thread gage support members for movement relative thereto in a direction perpendicular to the direction of movement of said upstanding thread gage elements, a pair of squareness-of-face gage elements mounted on said squareness-of-face gage element support and positioned between said workpiece and said thread gage support members for engagement with the end surface of said workpiece adjacent said thread gage support members on opposite sides of the axis thereof, one of said squareness-of-face gage elements comprising an arm rigidly mounted on said squareness-of-face gage element support and the other of said squareness-of-face gage elements comprising an arm pivotally mounted on said squareness-of-face gage element support by flexible metallic strip means for swinging movement between said workpiece and said thread gage support members in a plane perpendicular to the direction of movement of said upstanding thread gage elements, and a dial indicator mounted on said squareness-of-face gage element support and engaging said squareness-of-face gage element mounted for swinging movement, whereby the squareness of the end surface of a workpiece will be indicated upon rotation of a threaded workpiece engaged by the upstanding thread gage elements.

---



2,772,485
**REGISTERING GAGE**
Herbert Gelb, New York, N. Y., assignor to Joseph Gelb Company, Newark, N. J.
Application December 14, 1954, Serial No. 475,124
1 Claim. (Cl. 33—184.5)

A gage for registering transparencies, photographic plates, and the like, which comprises a frame having two adjacent side portions meeting at an angle; a cylinder mounted on one of said side portions for eccentric rotation with the axis of revolution of said cylinder normal to the plane of said frame, said cylinder having a flange adjacent said side portion; and a plurality of other cylinders mounted on the other of said side portions for eccentric rotation with the axes of revolution of said other cylinders normal to the plane of said frame, each of said other cylinders having a flange adjacent said other of said side portions, whereby a sheet of material, such as a transparency, may be supported by said gage with edges of said sheet in contact with the cylindrical surfaces of at least three of said cylinders and with a flat surface of said sheet in contact with the flanges of at least three of said cylinders.

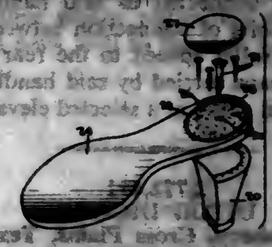
2,772,486
**APPARATUS FOR CONDITIONING, PREFERABLY DRYING, OF A WEB-LIKE MATERIAL**
Erik Johansson, Kiliston, Sweden, assignor to AB Svenska Flaktfabriken, Stockholm, Sweden
Application May 28, 1953, Serial No. 358,106
Claims priority, application Sweden May 29, 1952
1 Claim. (Cl. 34—199)

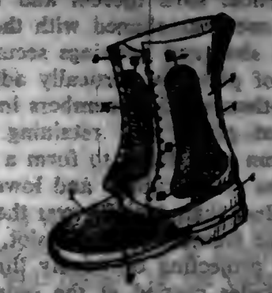
In apparatus for conditioning a continuous web of material, a casing having upper, side and end walls with an inlet for the web material in one side wall thereof and an outlet for said material in the other side wall thereof, a first series of upper rollers horizontally disposed in equally spaced parallel relation to one another in said casing adjacent the upper wall thereof, a second series of lower rollers horizontally disposed in equally spaced parallel relation to one another in said casing and below said first series of rollers, said first and second series of rollers being disposed in parallel spaced relation to each other with the rollers in one series staggered with respect to the rollers in the other series to support the web material and cause the same to pass through the casing in a succession of vertically spaced parallel courses of the material, a plurality of blast boxes arranged in superposed, vertically spaced, substantially parallel rows, with the boxes of each row disposed in equally spaced relation to one another between adjacent parallel courses of the web material and extending transversely of the casing adjacent the web material, the adjacent blast boxes of each row at opposite sides of each course of material being co-extensive with the width of the web material and positioned in spaced confronting relation relative to one another, and circulating means at one end of said casing for circulating a gaseous medium under pressure from the discharge side of said circulating means to each of said blast boxes, each of said blast boxes having a wall disposed in parallel confronting relation to the adjacent course of the web material and provided with a plurality of discharge orifices evenly interspaced over said wall area through which the gaseous medium from the discharge end of said circulating means is discharged perpendicularly into contact with the web material, the space between the superposed, vertically spaced rows of blast boxes defining discharge passages extending transversely of the web material and between the ends of said casing and communicating with the spaces between the spaced confronting walls of adjacent blast boxes of each row, whereby said circulating means is operable to draw the gaseous medium parallel to and in the direction of travel of the web material and then transversely through said discharge passages toward said one side of said casing and to the inlet side of said circulating means for recirculation through said blast boxes.

---



2,772,487
**BATCH DRYING BIN**
Raymond William Arndt, Columbus, Nebr.
Application July 21, 1952, Serial No. 299,940
7 Claims. (Cl. 34—174)

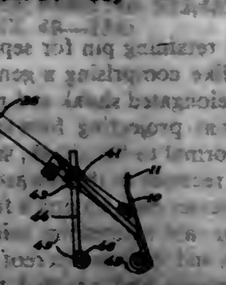
1. In a drying bin for grain and the like, two spaced end walls, a pair of transversely spaced guide-slots formed on each of the inner opposing faces of said end walls and each spaced inwardly of a margin of the associated end wall, said guide-slots of each pair extending downwardly from their top edges for a distance and then being directed inwardly and downwardly and terminating at a point short of meeting, interlocking foraminous wall members having their ends slidably received in opposing slots in opposite end walls respectively for insertion and removal, whereby vertical side walls and compartments between said partitions are provided for said bin, a ramp-plate bridging the space between said converging foraminous wall portions, and a screw-conveyor means supported on the bin and overlying said ramp-plate.



2,772,488
**SHOE HAVING COVERED INSOLE BODY AND NAILED-ON HEEL**
Jack Meltzer, Hollywood, Calif.
Application July 20, 1954, Serial No. 443,331
10 Claims. (Cl. 36—2.5)

1. In a shoe having a covered insole body and a heel beneath its rear end: an insole cover extending over the top surface of said insole body and around its edge, said cover having near its rear end a cut formed in its top surface and shaped to define the outline of a liftable element that may be temporarily lifted and then restored, the lifting of said element permitting the driving of fasteners through the insole body into said heel, the restoration of the element serving to conceal said fasteners, said element having a peripheral edge adapted to abut against and be snugly surrounded by the edge of said cut when the element is in restored position.

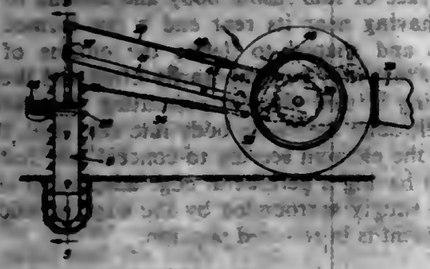
---



2,772,489
**MANUFACTURE OF FOOTWEAR**
Clinton D. Porter, Granby, Quebec, Canada, assignor to The Miner Rubber Company Limited, Granby, Quebec, Canada
Application January 3, 1956, Serial No. 557,195
7 Claims. (Cl. 36—72)

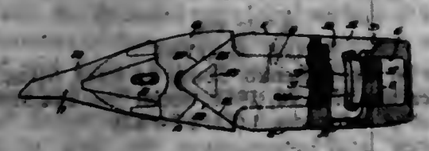
1. In protective footwear, protective pads inserted in the vamp, sides and tongue structure of the footwear, said protective pads comprising inner and outer sheets of relatively thin rubber and a multitude of thin flat rigid reinforcements laid between said sheets of rubber in a single plane and in a haphazard manner, said sheets of rubber being joined together between said reinforcements.

---



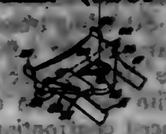
2,772,490
**SNOW SHOVEL**
Philip N. Hunstiberger, South St. Paul, Minn.
Application May 26, 1950, Serial No. 164,309
4 Claims. (Cl. 37—53)

1. A pushing device including an elongated blade, rollers secured to said blade and extending below the



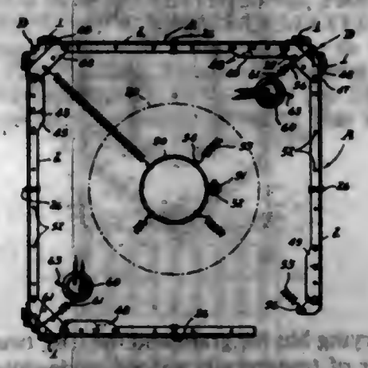
level thereof and closely adjacent the rear thereof to support the same, the axes of said rollers being substantially parallel to the plane of the blade, a handle secured to said blade and extending upwardly and rearwardly therefrom, a pair of braces secured to said blade near opposite ends thereof and connected to said handle at a point spaced from the point of connection between said handle and the blade, a roller spaced to the rear of said blade and adjustable means carried by said handle for supporting said last named roller at a selected elevation.

2,772,491
DITCH DIGGER
William M. Stansbury, Cross Plains, Tex., assignor of fifty percent to Lafayette M. Purvis, Cross Plains, Tex.
Application September 18, 1952, Serial No. 310,195
1 Claim. (Cl. 37—86)



In a ditch digger, a vertically elongated hollow digger frame composed of an upper pair of side plates and a lower pair of side plates and each pair of plates having opposed spaced apart flanges at their marginal edges, said upper and lower pairs of plates overlapping each other in extensibly adjustable arrangement, one pair of plates having vertical slots therein and the other pair of plates having openings aligned with the slots, fastening means in the slots and openings securing the upper and lower pairs of plates in vertically adjusted position relative to each other, spacing members internally of the innermost pair of plates and retaining the opposing flanges spaced from each other to form a slot extending peripherally of the frame, upper and lower sprockets in the frame, an endless chain trained over the sprockets and traveling inside the frame behind the slot, arms attached to the chain and projecting outwardly through the slot, and horizontal blades carried at the outer ends of the arms.

2,772,492
RETAINER PINS FOR DIPPER TEETH
Joseph P. Murtaugh, Pacific Palisades, Calif., assignor to American Brake Shoe Company, New York, N. Y., a corporation of Delaware
Application February 12, 1953, Serial No. 336,498
4 Claims. (Cl. 37—142)

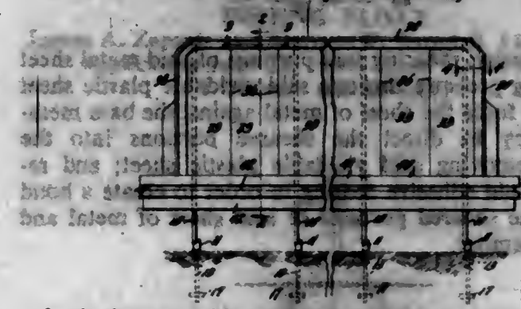


1. A retaining pin for separable parts of a dipper tooth or the like comprising a generally C-shaped member having an elongated shank and relatively short top and bottom extensions projecting forwardly from the shank substantially normal to the shank, said top and bottom extensions having recesses in the inwardly disposed faces thereof and said recesses each having a forward wall, a wedge disposed between said extensions, said wedge having projections at the top and bottom thereof respectively fitting loosely in said recesses and adapted to abut the forward walls of the respective recesses so as to limit displacement of the wedge outwardly in a forward direction in respect of the C-shaped member, and resilient means interposed between the opposed faces of the C-shaped member and the wedge to normally urge the wedge outwardly toward its limit position.

2,772,493
IRONING BOARDS
Robert Turner Hood, Castle Bromwich, near Birmingham, England, assignor to Bradley and Company Limited, Mount Pleasant, Milton, England, a British company
Application February 2, 1954, Serial No. 407,765
4 Claims. (Cl. 38—121)

4. The combination of a flat ironing board member of sheet metal, an elongated rear leg structure pivoted on a nonshifting axis positioned beneath said board member, an elongated front leg structure, said rear and front leg structures being pivoted to each other intermediate their ends in scissors-fashion, guide means fixed to the underside of said board member, projections which are carried by said front leg structure and are slidable along said guide means, said guide means being provided with a series of spaced apertures extending longitudinally of said guide means, spring loaded catch pivoted to and carried by said projections and carrying a detent adapted to engage in said apertures thereby constituting means to arrest said projections in selected positions along said guide means and a manually tiltable plate lying along said guide means and extending therefrom toward the side of said board member, said plate being equipped with means acting to oppose engagement of said detent with said stops and thus to disable the means to arrest said projections, whereby said rear and front leg structures may be folded against said board member.

2,772,494
DISPLAY DEVICE
Robert E. Bishop, Ashland Heights, Ill., assignor to Bishop Publishing Company, Cook County, Ill., a corporation of Illinois
Application January 10, 1951, Serial No. 205,358
21 Claims. (Cl. 40—125)



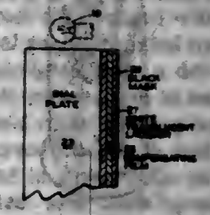
1. In combination in an articulated display, a panel frame having elongated side members and an elongated retaining member connected to one of the side members with the longitudinal axis of the retaining member generally paralleling the longitudinal axis of the one side member, the connection between the members extending along substantially the entire length of one side of the frame and comprising an elongated substantially cylindrical socket on one of the connected members and an elongated rib of substantially circular section complemental to and received in the socket on the other of the connected members for relatively longitudinal sliding movement, a recess in the rib, and means carried

by said one connected member and receivable in the rib recess to locate and retain the connected members in predetermined relative longitudinal positions.

2,772,495
DEMOUNTABLE METAL OUTDOOR ADVERTISING SIGN STRUCTURE WITH A MINIMUM OF SECURING DEVICES
Raymond R. Daniels, Clearwater, Fla., assignor to Panel-Lok Corporation, Clearwater, Fla., a corporation of Florida
Application March 24, 1954, Serial No. 418,345
4 Claims. (Cl. 40—125)

1. A demountable outdoor advertising sign, comprising a plurality of vertical standards disposed in horizontally spaced relation, a plurality of horizontal stringer members extending between and removably secured to said standards in vertically spaced relation, a plurality of vertically disposed horizontally spaced angle iron supports having rearwardly extending diverging faces thereon slidably mounted on one of said stringer members in freely depending relation, and a plurality of substantially flat sheet metal panel members disposed in side by side abutting relation forwardly of said slidably mounted angle iron supports, each panel member terminating at its opposed side edges in rearwardly and inwardly inclined vertical flanges respectively interlocked with the rearwardly diverging faces of an adjacent pair of said slidably mounted angle iron supports, the slidable mounting said angle iron supports on said horizontal stringer member facilitating the interlocking and disengagement of said panel members therewith without the use of separate securing devices.

2,772,496
ILLUMINATED SIGN STRUCTURE
Harold A. Meyrick, Nashville, and Walter E. Ellsworth, Indianapolis, Ind.
Application September 13, 1955, Serial No. 309,462
16 Claims. (Cl. 40—130)



1. A display structure including a member of light-transmitting material having closely spaced cooperable electrodes providing indicia means formed thereon by a transparent light-transmitting, electrically conductive coating material, said member defining an enclosed space between said cooperable electrodes operatively mounted on opposite closely spaced inner faces of the member forming the enclosed space, and an ionizable gas contained within said enclosed space and between said spaced cooperable electrodes.

2,772,497
ILLUMINATED DISPLAY SIGN
George Nelson, Chicago, Ill., assignor to Price Brothers, Inc., Chicago, Ill., a corporation of Illinois
Application November 20, 1953, Serial No. 393,625
2 Claims. (Cl. 40—130)

1. In an illuminated display sign, in combination a hollow horizontally extending base open at its front side and having a top wall and a bottom wall, a lamp mounted in said base in the area of the open front side, a normally vertically extending housing including front and back walls and a bottom wall, said housing having an open lower end, at least one of said housing walls being translucent, hinge means connecting the lower portion of the housing back wall to the base top wall in a manner to permit the housing normally to assume a substantially vertical position while in use and a substantially horizontal position overlying the base during servicing, said housing open lower end registering with the open front side of the base when the housing is in its vertical position to permit illumination of the translucent housing wall.

2,772,498
EDGE ILLUMINATED PANEL
George S. Miles, Englewood, N. J., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application April 23, 1952, Serial No. 283,933
2 Claims. (Cl. 40—130)

1. A device of the type described comprising a transparent base member, a source of illumination positioned and arranged with respect to the base member so that light rays therefrom are transmitted at an edge of the base member, a compensating filter on said base member through which light rays pass, said filter having portions located adjacent the source of illumination which are of greater opacity than the opacity of other portions of said filter located remote from said source to provide uniform illumination therethrough, a translucent layer over said compensating filter, and an indicia carrying layer over said translucent layer.

2,772,499
CARDBOARD FRAMES
Tony F. Fornoci, Seattle, Wash.
Application July 18, 1955, Serial No. 522,435
12 Claims. (Cl. 40—154)

1. A frame comprising a base piece of polygonal form, first marginal strips foldably joined to the respective edges of said base piece to extend along the length of such latter edges, second marginal strips foldably joined

to the respective first marginal strips along fold lines extending parallel to the respective fold lines between the latter and the base piece, said third marginal strips foldably joined to the respective second marginal strips along fold lines extending parallel to the respective fold lines between the first and second marginal strips, said third marginal strips having securing tabs projecting edgewise therefrom transversely to their length to extend generally parallel to said base piece with said first strips folded relative to said base piece to extend generally laterally therefrom, with said second strips folded relative to said first strips to extend generally laterally therefrom to overlie said base piece, and with said third strips folded back on said second strips likewise to extend generally parallel to said base piece and disposed between the latter and said second strips respectively, said base piece having secured thereto a plurality of slotted securing tab elements projecting upwardly therefrom at relative locations corresponding to the respective first-mentioned securing tabs with said strips folded as defined above, to receive the latter tabs in the slots thereof for holding said first, second and third strips in said folded relationship, whereby a sheet-like object may be held between said base piece tabs beneath said third marginal strips.

---

**2,772,900**
**PROTECTIVE CLOSURE FOR DECORATIVE ORNAMENTS**
Sidney Cain, New York, and Ralph Paolillo, Brooklyn, N. Y.
Application September 20, 1954, Serial No. 457,086
1 Claim. (Cl. 41—10)

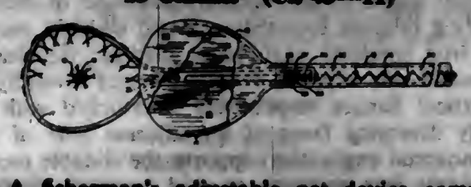
A decorative object comprising a circular base, an ornament thereon, and a transparent cover supported upon the base and encasing said ornament, said ornament including a pedestal and a statuette on said pedestal, said cover including a cylindrical, upstanding hollow body, the upper end of said body merging into a semi-spherical upper end wall, said body being formed wholly of a transparent material, the base having a flat upper surface formed with a marginal upwardly opening groove, the base being formed, in the areas circumscribed by said groove, with an upwardly opening recess and with a plurality of openings, said decorative object further including a sprig of simulated flowers engaged in said recess, said ornament pedestal being formed with a depending series of pegs engageable in selected openings of the base, said pedestal being formed of a pair of superposed sections, the pegs depending from the underside of one of said sections, the other section having openings corresponding in spacing to the pegs to normally receive the same, said last-named section being removable from engagement with the first-named section

---

**2,772,901**
**METHOD OF MANUFACTURING ELECTRICAL CIRCUIT COMPONENTS**
Robert J. Malcolm, Arlington Heights, Ill.
Application May 31, 1956, Serial No. 588,323
17 Claims. (Cl. 41—37)

1. A method of forming electrical devices comprising the steps of forming a rigid base member of insulating material having a plurality of grooves at least some of which are connected to form a circuit pattern in at least one surface of said member; substantially covering said base member with a thin sheet of metal having a normally dry, reactivatable adhesive coating on the surface thereof facing the base member with portions of said metal sheet being disposed adjacent the grooves in said one surface; covering said sheet of metal with a sheet of yieldable

plastic material; shearing said portions of said metal sheet by applying pressure through said yieldable plastic sheet in order to force the sheet of metal against the base member, thereby to direct the sheared portions into the grooves; removing said yieldable plastic sheet; and reactivating said adhesive coating in order to create a bond between the sheared portions of said sheet of metal and the base member.

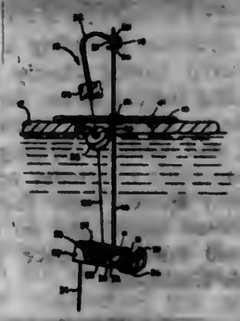


---

**ERRATUM**

For Class 41—46 see:
Patent No. 2,772,942

---



**2,772,902**
**FISHERMAN'S ADJUSTABLE NET**
Leonard H. Norris, Denver, Colo.
Application December 15, 1955, Serial No. 553,377
13 Claims. (Cl. 43—11)

1. A fisherman's adjustable net device comprising a primary handle, a net proper having an extension handle having an end portion slidable into said primary handle, and a housing carried by said primary handle for substantially complete encasement of said net proper when retracted without change in shape of the latter.

---

**2,772,903**
**FISHING DEVICE**
Hugo F. Kiffer, Oneida, N. Y.
Application November 22, 1952, Serial No. 321,988
2 Claims. (Cl. 43—17)

1. In a fishing device, a rod member having an end portion thereof bent at right angles to the main axis of said member, signalling means detachably secured to the opposite end of said rod member, an elongated spinner element having a plurality of apertures formed therethrough intermediate the ends thereof, said elements being adapted to be rockably mounted at various angular positions on the bent portion of said rod member and being adapted

to support the reserve windings and slack windings of a fishing line, said reserve windings being located on one side of the selected pivot point and said slack windings being located on the other side thereof, and a trigger element secured to said signalling means and engageable by said slack windings to position the signalling means in a set position, said signalling means being released from the set position to signal a bite when said slack windings are removed from said spinner element by a fish, and said spinner element being adapted to rock on said bent portion as said windings are removed.

---

**2,772,904**
**FISHING FLOAT**
James A. Zerante and Norman E. Bergdall, Lima, Ohio
Application June 23, 1954, Serial No. 438,690
1 Claim. (Cl. 43—17)

A fishing float comprising a hollow spherical body with diametrically opposed projecting end portions, a wire extending diametrically across said hollow body in alignment with the end portions, a weight slidably mounted on said wire, said wire constituting means for releasably retaining a line in attached position to the float, said wire also constituting the guiding means for the weight, said weight being in the form of a disc having a diameter less than one-half the diameter of the interior of the hollow body, said weight having a thickness less than one-half the diameter of the interior of the hollow body thereby permitting the weight to shift from a point completely within one end of the hollow body to a point completely within the other end of the body for stabilizing the hollow body with either end portion thereof disposed upwardly, the outer surface of one end portion and the adjacent one-half of the body being colored one distinguishable color and the other end portion and adjacent one-half of the body being colored a different distinguishable color, said body adapted to float in the water with the end portion having the line attaching means and the adjacent portion of the body being revealed above the water, said body adapted to be inverted by a downward pull on the fishing line extending downwardly into the water thereby causing the weight to slide on the wire guide to a position against the diametrically opposed inner surface of the hollow body thereby retaining the other end portion and the adjacent portion of the body above the water for observation thereof whereby the distinguishable colors will indicate the position of the hollow body.

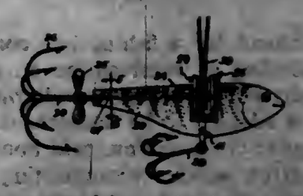
---

**2,772,905**
**FISHING DEVICE**
Donald W. Kaiser, Adrian, Mich.
Application May 11, 1954, Serial No. 429,000
7 Claims. (Cl. 43—26)

5. A fishing device comprising: a flexible rod; a handle concentrically journaled on the rear of the rod which has an integral, co-axial spool at its forward end; a crank secured to the rod behind the handle; a plurality of aligned line guides secured to the rod forward of the spool; and a winding guide secured to the rod and projecting from the same side of the rod as the line guides, said winding guide including an upwardly and rearwardly extending

mounting portion which projects over the spool and having and eye therein above the spool the axis of which is substantially parallel to the axis of the spool.

---

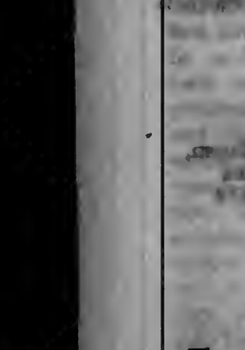


**2,772,906**
**FISHING REEL PUMP DRIVES**
George Hagen, San Diego, Calif.; Marguerite Hagen, administratrix of said George Hagen, deceased
Application March 10, 1953, Serial No. 341,530
2 Claims. (Cl. 43—20)

2. A fishing reel pump drive for a fishing reel mounted upon a fishing pole, said drive including manually operated mechanism all parts of which are housed exteriorly of said pole and operatively connected to drive said reel, and said drive comprising an elongated cylindrical casing removably secured to said pole and having a gear box adjacent to said reel; a one-way threaded drive shaft mounted to rotate within said casing and having one end protruding within said gear box; a disc bevel gear secured to the shaft of said reel and located within said gear box; a pair of conical bevel gears mounted upon said shaft and meshing with said disc bevel gear; a driving collar closely surrounding said shaft and secured to each of said conical bevel gears, each of said collars having tapering cutout portions in the walls thereof leading to said shaft, and spring thrust rollers mounted to slide within said cutout portions and forcibly to contact said shaft upon rotation of said shaft in the direction of said thrust but adapted to be released from said contact upon rotation of said shaft in the opposite direction; a sleeve with attached nut threaded to engage with said shaft and mounted to slide longitudinally within said casing, and a handle slidably mounted longitudinally outside of said casing; said handle having a protruding arm coextensive with said sleeve and connected with the outer end thereof; and means connecting with said casing for preventing the turning of said handle and extension thereof in relation to said casing and sleeve, and for securing said parts in undeviating longitudinal alignment.

---

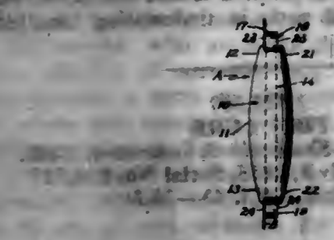
**2,772,907**
**FISH LURE**
Lonnie Edward Shackelford, Lancaster, Calif.
Application July 8, 1955, Serial No. 520,727
2 Claims. (Cl. 43—26.2)



2. A fish lure comprising a body, a shaft disposed in the body and provided with a propeller thereon, said shaft being provided with a fish hook, and means for rotating the shaft; said body being of solid construction and having a channel extending downwardly from the top to

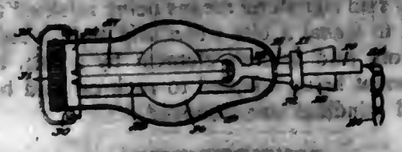
accommodate said shaft, and a pin disposed through the body and across the channel above said shaft to prevent displacement of the latter.

---



2,772,508
FISH LINE PULLAWAY SINKER
Eli M. Greenlee, Newport, Ky.; Claude A. Greenlee, administrator of the estate of said Eli M. Greenlee, deceased
Application April 28, 1954, Serial No. 426,259
4 Claims. (Cl. 43—43.15)

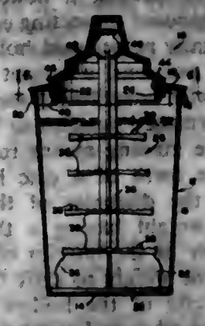
The combination with a fishing rod having a reel and a line, of a sinker comprising an open frame having a top wall, a bottom wall, and a pair of side walls connecting said top and bottom walls, a spool rotatably mounted between said side walls, the ends of said spool at their periphery extending outwardly beyond the vertical edges of said side walls to facilitate rotation thereof, a second line wound on said spool, said bottom wall having an opening therethrough, said second line passing downwardly through said opening, a stop ring connected to the end of said second line below said bottom wall and adapted to abut the latter when the second line is wound tightly on said spool, a third line connected at one end to said stop ring and at the other to a fish hook, a vertical lug integrally formed in said top wall having an aperture, the end of the first line being secured within said aperture, and a buoy threaded onto said first line intermediate the fishing rod and said frame whereby to retain the first line intermediate said buoy and frame in a substantially vertical position.



---

2,772,509
ATTACHMENTS FOR FISHING LINES
Charles L. Valenzo, St. Paul, Minn.
Original application April 27, 1949, Serial No. 90,030. Divided and this application June 29, 1953, Serial No. 364,503
8 Claims. (Cl. 43—44.91)

1. An attachment for a fishing line comprising an arrangement including in combination an elongated body having an aperture extending therethrough into which a fishing line is adapted to be inserted, said aperture being of rectangular cross section, said body having a slot of relatively narrow width communicating with said aperture, a contractable and expansible core extending through said aperture with its cross-sectional area normally filling the cross-sectional area of the aperture, and a pair of rounded ends on said core, said rounded ends having opposed flat sides.



2,772,510
ANIMAL TRAP AUXILIARY GUARD THUMB CATCH
Joseph Norman Rogers, Lafitte, La.
Application September 28, 1954, Serial No. 458,087
2 Claims. (Cl. 43—96)

1. A latch for an auxiliary spring guard of an animal trap of the type having spring actuated jaws and an anchoring chain comprising a bar, laterally extending arm portions on said bar adjacent one end thereof, means on the ends of the arms, for slidably mounting the bar on the trap, means for connecting an extended end portion of the bar to an anchoring chain of the trap, and an offset tongue portion extended from said one end of the bar and positioned to extend over the auxiliary spring guard of the trap.

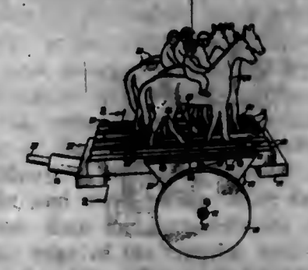
2,772,511
DEVICE FOR KILLING INSECTS
Herbert F. Tomasek, Pittsburgh, Pa., assignor to Pittsburgh Coke & Chemical Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application April 19, 1955, Serial No. 502,363
10 Claims. (Cl. 43—131)

1. A device for killing insects comprising a receptacle for containing liquid insecticidal composition and rigid means forming a plurality of vertically spaced horizontal generally planar surfaces for retaining the liquid insecticidal composition for exposure to insects, said means being movable between an inoperative, insecticide receiving position wherein the same is disposed within said receptacle for immersion within the insecticidal composition contained therein and an operative insecticide exposing position wherein said means is supported by said receptacle above the top of the latter.

---

2,772,512
PLAYING PIECE FOR GAME
Joseph Modica, Jr., Garden City South, N. Y., assignor to Tudor Metal Products Corporation, Brooklyn, N. Y., a corporation of New York
Application March 23, 1955, Serial No. 496,296
4 Claims. (Cl. 46—1)



1. In a playing piece for a game, said playing piece including a base having a laterally extending recess in the under face thereof, a section of general U-shaped formation in cross section having a web portion fitting said recess and side flanges provided with inwardly directed projections adapted to engage over the base for securing said section in position thereon with the web portion disposed in said recess, and a flat strip of flexible material secured between said base and the web

portion of said section with the end portions of said strip projecting from said recess at the ends of the web portion and depending from the under side of the base for supporting the playing piece on the end edges of the strip.

2,772,513
WHEEL ACTUATED TOY VEHICLE
John Hagen, St. Louis County, Mo.
Application May 3, 1954, Serial No. 427,084
6 Claims. (Cl. 46—205)

1. An action toy that comprises a frame, a shaft rotatably supported by said frame, a plurality of ground-engaging elements, at least one of said ground-engaging elements being connected to said shaft to drive said shaft, a guideway on said frame, a slide that is confined by said guideway for reciprocable movement, a second guideway on said frame, a second slide that is confined by said guideway for reciprocable movement, interacting surfaces that reciprocate the first said slide relative to the first said guideway whenever said shaft rotates, and a second set of interacting surfaces that reciprocate said second slide relative to said second guideway whenever said shaft rotates, said interacting surfaces being rollers that move with but are eccentric of said shaft and being slots in said slides that are transverse of said guideways, said slots having recesses contiguous therewith that are parallel to said guideways and that are in register with and can accommodate said shaft.

2,772,514
CLUSTER-BUSTER, FRUIT THINNING TOOL
Alvin R. Managanli, Palisade, Colo.
Application May 20, 1954, Serial No. 431,245
4 Claims. (Cl. 47—1)

1. A fruit thinning tool for selectively removing embryo fruit from a cluster including a resilient head comprising an outer sheath of flexible material, a core of flexible material, metallic reinforcement in the core, and a soft fruit striking tip, said tip comprising a soft yieldable striking face.

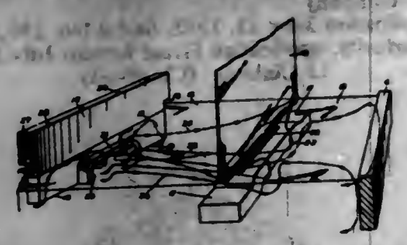
---

2,772,515
MANUFACTURE OF HOLLOW BLOCKS OF GLASS
John Dennett, Windle, St. Helens, England, assignor to Pilkington Brothers Limited, Liverpool, England, a British company
Application June 13, 1952, Serial No. 293,335
Claims priority, application Great Britain July 16, 1951
13 Claims. (Cl. 49—1)

12. Apparatus for use in welding together two half blocks of glass, the rims of which are at such a temperature as to permit welding, the apparatus comprising two platens, means on each platen for locating a half block in predetermined position thereon, so that on tilting the platens upward toward each other, there will be upward progressively increasing contact of the rims in registry, actuating means for tilting up the platens until they are nearly vertical, and independent means effective to operate against the backs of the platens to force the platens into their vertical positions at a controlled speed slow enough to permit the gases from between the half blocks to escape from said half blocks while said half blocks are at the welding temperature, thereby to control the ultimate gaseous pressure in the cavities of the blocks when said blocks are cooled.

13. A method of welding together hollow half blocks of glass to form a hollow glass building block in which the rims of the half blocks are heated to above softening point just prior to welding characterised by locating the half blocks on their bases in spaced side by side relation, heating upwardly extending rims of said half blocks to above the softening point of the glass, tilting up the half blocks with their rims heated so that the soft rims of the lowermost adjacent rim parts meet and the half blocks then roll on to one another as the rims of the side walls approach to close proximity beginning at the bottom, whereby the rapidly expanding gaseous volume encompassed between the half blocks is constrained to exude mainly between the portion of the rims in the uppermost parts of the half blocks, applying a force to each of the half blocks to complete the tilting movement to effect welding over the whole of the rims, regulating the period of time between the side walls reaching the position of close proximity and the moment of welding, so as to permit the gases from between the half blocks to escape from said half blocks while maintaining the rims of said half blocks above the softening point of glass, thereby to control the ultimate gaseous pressure in the cavity of the block when cool, and positively heating the atmosphere above the tilted up half blocks to prevent descent of relatively cold atmospheric air into the cavity encompassed by the half blocks during the final stages of egress of the enclosed gaseous volume.

2,772,520



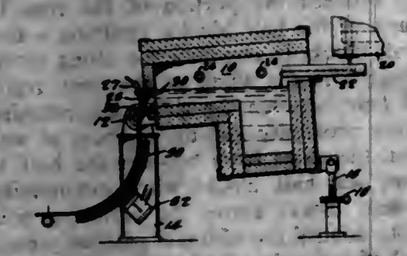
said rings while the rings are abrading the lap surface so

2,772,516

**METHODS OF AND APPARATUS FOR VERTICALLY DRAWING GLASS IN SHEET FORM**

George W. T. Bird, St. Helens, England, assignor to Pilkington Brothers Limited, Liverpool, England, a British company

Application January 3, 1951, Serial No. 204,248
Claims priority, application Great Britain January 13, 1950
9 Claims. (Cl. 49—17)



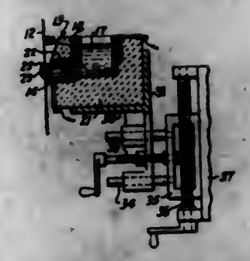
1. A method of regulating the flow of metal in a drawing kiln from which glass in sheet form is vertically drawn, characterised by obstructing the general flow of metal towards the line of draw, at a point remote therefrom and in a zone extending from one lateral boundary of the flow to the other and downwardly from the surface of the metal to a selected lower level of said metal having the same direction of flow as at the surface of said metal, an intermediate region of said zone spaced from said lateral boundaries extending downwardly to a depth less than the other regions of said zone, whereby to constrain a volume of metal to flow from said lower level towards said line of draw and medially of the kiln and to impart to said volume a kinetic energy causing that the whole of the metal which forms the sheet enters the drawing kiln about the centre line thereof and as a layer of shallow depth at said lower level, whereby glass of the same viscosity is fed into both faces of the sheet being drawn.

3. Apparatus for regulating the flow of metal in a drawing kiln from which glass in sheet form is vertically drawn characterised by an obstructing member remote from the line of draw extending across the width of said kiln between the supply of the metal and the line of draw and extending downwardly from the surface of the metal to a selected lower level having the same direction of flow as at the surface, the underside of said obstructing member being arched in a region spaced from and intermediate its ends to direct the flow of metal passing therethrough medially of the kiln in the vicinity of the draw line.

2,772,517

**FEEDER FOR SHEETS OF GLASS AND SIMILAR THERMOPLASTIC MATERIALS**

Urban E. Bowes, Perrysburg, Ohio
Application October 9, 1952, Serial No. 313,957
4 Claims. (Cl. 49—17)

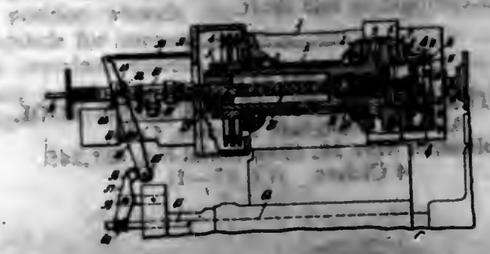


1. A feeder for sheet glass or the like comprising a container for molten glass, a metal alloy body member in an outer wall of said container, a plurality of laterally spaced individual openings formed in said member, said openings extending inwardly and downwardly from the inner face thereof and partially through said member, a laterally extending continuous rectangular discharge opening extending inwardly from the outer face of said member intersecting within said body member the lower ends of all of said individual openings, means for regulating the static pressure head of molten glass over said openings, by changing the height of the glass over said openings, to thereby control the flow of glass through said individual openings to said laterally extending discharge opening, said latter discharge opening having the dimensions of the finally formed sheet, and means to heat said body member to maintain therein a predetermined temperature.

2,772,518

**METHOD OF COATING GLASS FILAMENTS WITH METAL**

Harry B. Whitehurst, Granville, and William H. Otto, Newark, Ohio, assignors to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Application November 10, 1952, Serial No. 319,724
10 Claims. (Cl. 49—77)

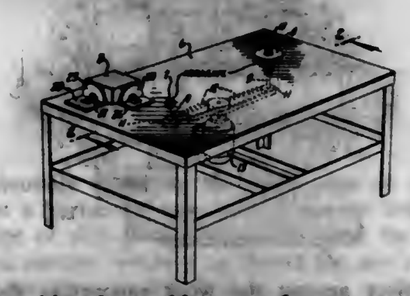


2. The method of coating a glass filament with metal comprising suspending a globule of molten metal in a given position under its own surface tension, passing a continuous filament through said globule at a temperature compatible to receive a coating of said metal, and supplying molten metal for said globule to maintain it in size equilibrium by replenishing molten metal removed from said globule in coating said filament.

2,772,519

**AIR GAGING MECHANISM FOR CENTERLESS GRINDERS**

Walter A. Boyd, Jr., Woodstock, Vt., assignor to Bryant Chucking Grinder Company, Springfield, Vt., a corporation of Vermont
Application February 16, 1954, Serial No. 409,313
2 Claims. (Cl. 51—48)

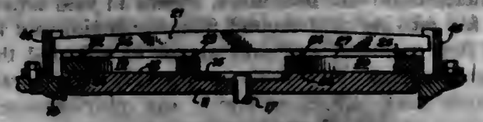


2. In combination, a rotary hollow spindle, means for supporting said spindle, a driver secured to one end of said spindle and having a bore concentric with said spindle of slightly larger size than the finished bore of a work piece to be held there against, means for clamping said work piece against said driver, a non-rotatable tube extending through and movable lengthwise of said spindle, means for supporting said tube, an air gage nozzle held by said tube concentric with the bore of said work piece, an air tube within said non-rotatable tube and leading to said nozzle for supply air under pressure to said nozzle, and means for delivering coolant between said tubes past said nozzle into the work piece.

2,772,520

**MACHINE FOR FORMING PIPE-FITTING COVERS**

Richard C. Jaye, Watertown, Wis., assignor to The Jaye Corporation, Watertown, Wis., a corporation of Wisconsin
Application May 6, 1955, Serial No. 506,645
3 Claims. (Cl. 51—100)

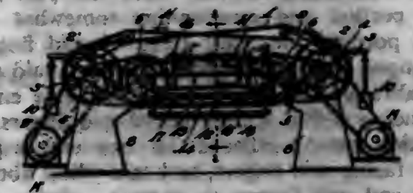


1. A machine for making complementary pipe fitting cover sections, which sections are adapted to mate on a plane of junction coinciding with the median plane of the fitting when the sections are in position on the fitting, comprising: a table; a power driven rotary cutter; means mounting the cutter for rotation about an axis perpendicular to the table with the cutter disposed above the table, said means including a circular base against the top of which the underside of the cutter abuts, and by which the cutter is spaced a definite distance above the surface of the table, said base having a smooth circular periphery; a combined templet and work holder, said templet and work holder being flat and of a thickness not less than the perpendicular distance from the upper outer edge of the circular base to the surface of the table; means on the combined templet and work holder for locating and holding a block of material thereon with the bottom of the block flat against the top of the templet and work holder; said combined templet and work holder having a slot formed therein of a size and shape corresponding to that of the pipe fitting contemplated and of a width sufficient to receive the cutter base, the sides of said slot providing guide edges engageable with the side of the cutter base and extending at least up to said means for locating and holding the block of material, said slot having continuations which extend outwardly beyond said means for locating and holding the block of material so that the cutter may be optionally engaged in or disengaged from the extended end portions of the slot, outwardly of the block of material on the combined templet and work holder; and the cutter being shaped to form a groove in the underside of the block of a size to receive one half of the fitting therein.

2,772,521

**METHOD AND APPARATUS FOR AUTOMATICALLY CONDITIONING A LAP**

Charles F. Voytech, Chicago, Ill.
Application December 18, 1953, Serial No. 398,947
12 Claims. (Cl. 51—129)

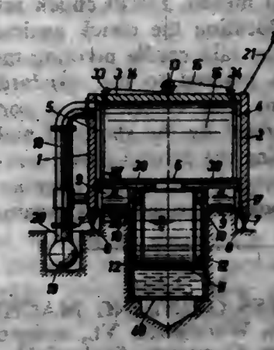


1. The method of conditioning a rotatable lap surface to coincide with a predetermined plane, said method comprising the steps of abrading the lap surface by means of a plurality of rotating rings each ring having substantially radially disposed sides, with one such side of each ring resting upon the lap surface whereby to abrade the lap surface by said side as aforesaid, said two rings being disposed on opposite sides of a lap diameter, placing a common rigid weight upon the other side of at least two of said rings while the rings are abrading the lap surface so as to support said weight by the rings with the center of gravity of the weight located substantially on the axis of rotation of the rotatable lap surface, and limiting the contact between the weight and rings to points which are in a plane parallel with the predetermined plane of the lap surface and on opposite sides of a diameter of each ring which is disposed transversely of a radius of the lap surface.

2,772,522

**MECHANICAL SANDERS**

Masatsugu Minami, Meguro-ku, Tokyo, Japan
Application March 18, 1954, Serial No. 417,162
3 Claims. (Cl. 51—141)

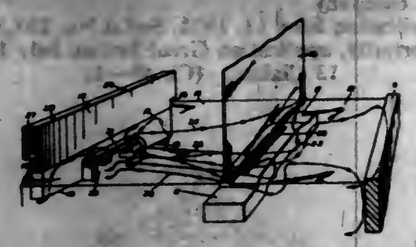


1. A machine for sanding sheet material comprising means for movably supporting and guiding the sheet material during sanding for movement in one direction and in a substantially straight flat position, an endless driven belt having an exterior sanding surface, means movably supporting and directing said belt crosswise of a face of the sheet material being sanded and in a direction substantially perpendicular to the direction of movement of said material, an endless pressing belt, means movably supporting and directing said pressing belt for movement in line with, spaced above, parallel to said sanding belt, means for driving said pressing belt at a speed differing from that of said sanding belt, and a plurality of spaced apart pliable shoes carried by said pressing belt and positioned for rubbing against said sanding belt and pressing the portions of said sanding belt therebeneath against said sheet material.

2,772,523

**PLANT FOR PICKLING METALLIC WORKPIECES**

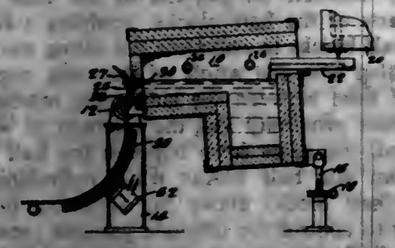
Othmar Rudiger, Vienna, Austria
Application March 28, 1956, Serial No. 574,585
Claims priority, application Austria March 28, 1955
13 Claims. (Cl. 51—164)



1. A drum-type pickling plant comprising a series of tanks filled with treating liquid, a drum having an apertured shell and rotatable about a horizontal axis, which drum can be lowered into the tanks, supporting and drive rollers for supporting and rotating the said drum, a gate-like frame movable over the series of tanks, a cross-spar which can be lifted and lowered within the said frame, and bearings slidable on said cross-spar for carrying the said supporting and drive rollers for the drum.

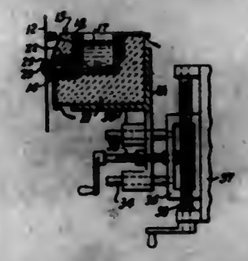
32 OFFICIAL GAZETTE DECEMBER 4, 1956

DECEMBER 4, 1956 GENERAL AND MECHANICAL 33



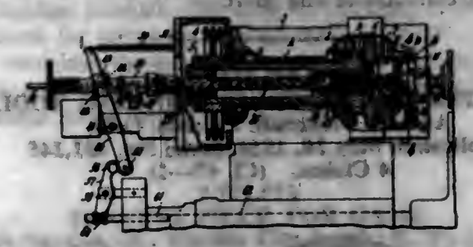
2,772,516
METHODS OF AND APPARATUS FOR VERTICALLY DRAWING GLASS IN SHEET FORM
George W. T. Bird, St. Helens, England, assignor to Pilkington Brothers Limited, Liverpool, England, a British company
Application January 3, 1951, Serial No. 204,248
Claims priority, application Great Britain January 13, 1950
9 Claims. (Cl. 49—17)

1. A method of regulating the flow of metal in a drawing kiln from which glass in sheet form is vertically drawn, characterised by obstructing the general flow of metal towards the line of draw, at a point remote therefrom and in a zone extending from one lateral boundary of the flow to the other and downwardly from the surface of the metal to a selected lower level of said metal having the same direction of flow as at the surface of said metal, an intermediate region of said zone spaced from said lateral boundaries extending downwardly to a depth less than the other regions of said zone, whereby to constrain a volume of metal to flow from said lower level towards said line of draw and medially of the kiln and to impart to said volume a kinetic energy ensuring that the whole of the metal which forms the sheet enters the drawing kiln about the centre line thereof and as a layer of shallow depth at said lower level, whereby glass of the same viscosity is fed into both faces of the sheet being drawn.



3. Apparatus for regulating the flow of metal in a drawing kiln from which glass in sheet form is vertically drawn characterised by an obstructing member remote from the line of draw extending across the width of said kiln between the supply of the metal and the line of draw and extending downwardly from the surface of the metal to a selected lower level having the same direction of flow as at the surface, the underside of said obstructing member being arched in a region spaced from and intermediate its ends to direct the flow of metal passing therethrough medially of the kiln in the vicinity of the draw line.

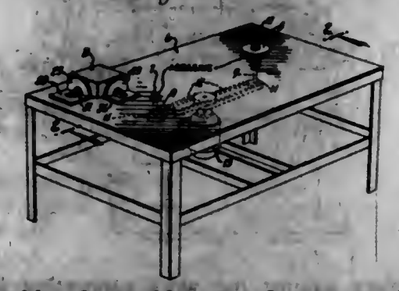
2,772,517
FEEDER FOR SHEETS OF GLASS AND SIMILAR THERMOPLASTIC MATERIALS
Urban E. Bowes, Perrysburg, Ohio
Application October 9, 1952, Serial No. 313,957
4 Claims. (Cl. 49—17)



1. A feeder for sheet glass or the like comprising a container for molten glass, a metal alloy body member in an outer wall of said container, a plurality of laterally spaced individual openings formed in said member, said openings extending inwardly and downwardly from the inner face thereof and partially through said member, a laterally extending continuous rectangular discharge opening extending inwardly from the outer face of said member intersecting within said body member the lower ends of all of said individual openings, means for regulating the static pressure head of molten glass over said openings, by changing the height of the glass over said openings, to thereby control the flow of glass through said individual openings to said laterally extending discharge opening, said latter discharge opening having the dimensions of the finally formed sheet, and means to heat said body member to maintain therein a predetermined temperature.

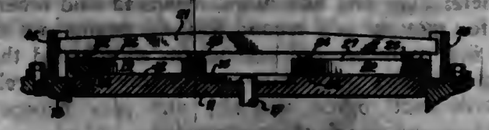
2,772,518
METHOD OF COATING GLASS FILAMENTS WITH METAL
Harry B. Whitehouse, Granville, and William H. Otto, Newark, Ohio, assignors to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Application November 10, 1952, Serial No. 319,724
10 Claims. (Cl. 49—77)

2. The method of coating a glass filament with metal comprising suspending a globule of molten metal in a given position under its own surface tension, passing a continuous filament through said globule at a temperature compatible to receive a coating of said metal, and supplying molten metal for said globule to maintain it in size equilibrium by replenishing molten metal removed from said globule in coating said filament.



2,772,519
AIR GAGING MECHANISM FOR CENTERLESS GRINDERS
Walter A. Boyd, Jr., Woodstock, Vt., assignor to Bryant Chucking Grinder Company, Springfield, Vt., a corporation of Vermont
Application February 10, 1954, Serial No. 409,313
2 Claims. (Cl. 51—48)

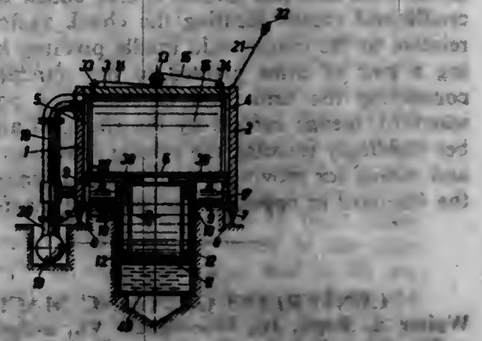
2. In combination, a rotary hollow spindle, means for supporting said spindle, a driver secured to one end of said spindle and having a bore concentric with said spindle of slightly larger size than the finished bore of a work piece to be held there against, means for clamping said work piece against said driver, a non-rotatable tube extending through and movable lengthwise of said spindle, means for supporting said tube, an air gage nozzle held by said tube concentric with the bore of said work piece, an air tube within said non-rotatable tube and leading to said nozzle for supply air under pressure to said nozzle, and means for delivering coolant between said tubes past said nozzle into the work piece.



2,772,520
MACHINE FOR FORMING PIPE-FITTING COVERS
Richard C. Jaye, Watertown, Wis., assignor to The Jaye Corporation, Watertown, Wis., a corporation of Wisconsin
Application May 6, 1955, Serial No. 506,645
3 Claims. (Cl. 51—100)

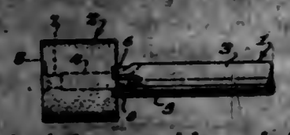
1. A machine for making complementary pipe fitting cover sections, which sections are adapted to mate on a plane of junction coinciding with the median plane of the fitting when the sections are in position on the fitting, comprising: a table; a power driven rotary cutter; means mounting the cutter for rotation about an axis perpendicular to the table with the cutter disposed above the table, said means including a circular base against the top of which the underside of the cutter abuts, and by which the cutter is spaced a definite distance above the surface of the table, said base having a smooth circular periphery; a combined templet and work holder, said templet and work holder being flat and of a thickness not less than the perpendicular distance from the upper outer edge of the circular base to the surface of the table; means on the combined templet and work holder for locating and holding a block of material thereon with the bottom of the block flat against the top of the templet and work holder; said combined templet and work holder having a slot formed therein of a size and shape corresponding to that of the pipe fitting contemplated and of a width sufficient to receive the cutter base, the sides of said slot providing guide edges engageable with the side of the cutter base and extending at least up to said means for locating and holding the block of material, said slot having continuations which extend outwardly beyond said means for locating and holding the block of material so that the cutter may be optionally engaged in or disengaged from the extended end portions of the slot, outwardly of the block of material on the combined templet and work holder; and the cutter being shaped to form a groove in the underside of the block of a size to receive one half of the fitting therein.

2,772,521
METHOD AND APPARATUS FOR AUTOMATICALLY CONDITIONING A LAP
Charles F. Voytech, Chicago, Ill.
Application December 18, 1953, Serial No. 398,947
12 Claims. (Cl. 51—129)



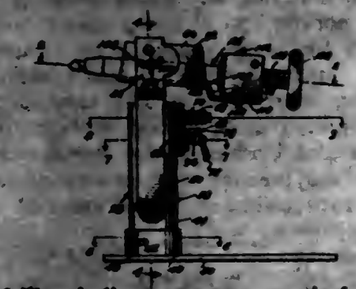
1. The method of conditioning a rotatable lap surface to coincide with a predetermined plane, said method comprising the steps of abrading the lap surface by means of a plurality of rotating rings each ring having substantially radially disposed sides, with one such side of each ring resting upon the lap surface whereby to abrade the lap surface by said side as aforesaid, said two rings being disposed on opposite sides of a lap diameter, placing a common rigid weight upon the other side of at least two of said rings while the rings are abrading the lap surface so as to support said weight by the rings with the center of gravity of the weight located substantially on the axis of rotation of the rotatable lap surface, and limiting the contact between the weight and rings to points which are in a plane parallel with the predetermined plane of the lap surface and on opposite sides of a diameter of each ring which is disposed transversely of a radius of the lap surface.

2,772,522
MECHANICAL SANDERS
Masatsugu Minami, Meguro-ku, Tokyo, Japan
Application March 18, 1954, Serial No. 417,162
3 Claims. (Cl. 51—141)



1. A machine for sanding sheet material comprising means for movably supporting and guiding the sheet material during sanding for movement in one direction and in a substantially straight flat position, an endless driven belt having an exterior sanding surface, means movably supporting and directing said belt crosswise of a face of the sheet material being sanded and in a direction substantially perpendicular to the direction of movement of said material, an endless pressing belt, means movably supporting and directing said pressing belt for movement in line with, spaced above, parallel to said sanding belt, means for driving said pressing belt at a speed differing from that of said sanding belt, and a plurality of spaced apart pliable shoes carried by said pressing belt and positioned for rubbing against said sanding belt and pressing the portions of said sanding belt therebeneath against said sheet material.

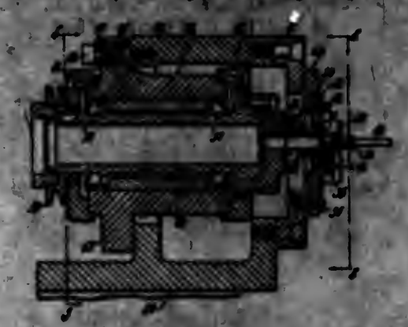
2,772,523
PLANT FOR PICKLING METALLIC WORKPIECES
Othmar Rußner, Vienna, Austria
Application March 28, 1956, Serial No. 574,505
Claims priority, application Austria March 28, 1955
13 Claims. (Cl. 51—164)



1. A drum-type pickling plant comprising a series of tanks filled with treating liquid, a drum having an apertured shell and rotatable about a horizontal axis, which drum can be lowered into the tanks, supporting and drive rollers for supporting and rotating the said drum, a gate-like frame movable over the series of tanks, a cross-spar which can be lifted and lowered within the said frame, and bearings slidable on said cross-spar for carrying the said supporting and drive rollers for the drum.

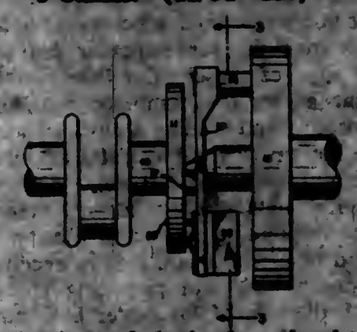
2,772,524
ABRASIVE GRINDERS
John F. Koenigsmid, North Tonawanda, N. Y.
Application January 27, 1956, Serial No. 561,857
7 Claims. (Cl. 51—168)

1. An improved grinder comprising a shaft having one end portion of smaller cross sectional area than the other end portion, and an intermediate portion connecting the two end portions and increasing in diameter from said one end portion to the other end portion, said other end portion at its junction with said intermediate portion having fingers extending endwise therefrom past said intermediate portion and overrunning somewhat with said one end portion, the outer faces of said fingers being continuations of the peripheral surface of said other end, said one end portion including within it the ends of said fingers, said one end portion having adjacent its free end a peripheral shoulder facing said fingers, and said wheel abutting said shoulder and said fingers to prevent endwise movement of said wheel along said shaft in both directions, and said fingers also causing rotation of said wheel with said shaft.



2,772,525
DRILL GRINDER ATTACHMENT
William H. Forster, Elberton, Ga.
Application September 25, 1953, Serial No. 382,399
2 Claims. (Cl. 51—219)

1. In a drill grinding means, a vertical standard, a support, means mounting the standard on the support for limited rotational movement, a cradle pivotally mounted on the standard, means pivoting said cradle at vertically spaced points for separate adjustment about vertically spaced horizontal axes, locking means associated with said last means, a drill chuck resting in said cradle and means locating the chuck against movement relative to the cradle, said cradle pivoting means including a pair of arms pivoted to the standard a member connecting the arms and embracing a portion of the standard, means carried by the standard and said member yieldingly resisting the pivotal movement of the arms and means for moving the arms and member away from the standard in opposition to said last means.



2,772,526
CENTERLESS GRINDING MACHINE
Walter A. Boyd, Jr., Woodstock, Vt., assignor to Bryant Chucking Grinder Company, Springfield, Vt., a corporation of Vermont
Application March 3, 1955, Serial No. 491,842
16 Claims. (Cl. 51—236)

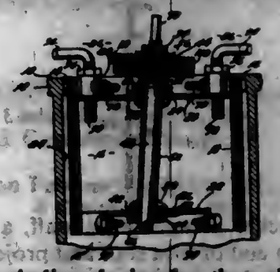
1. In a centerless grinding machine, the combination of a machine housing, a work rotating device mounted from the housing including a rotary work engaging end plate supported to turn on an axis on the housing, means holding the workpiece against the plate for maintaining a frictional driving engagement between the end plate and workpiece, work supporting means comprising radial work supporting shoes against which the work is held to rotate on an axis offset from the axis of the end plate, the work rotational axis determined by said shoes, and the axis of said rotary end plate being disposed to bias

the workpiece against the work supporting shoes, and means for relatively shifting the axis position of the end plate and of said shoes to reverse the radial bias of the rotating end plate upon the workpiece with respect to the shoes, and thereby to displace the workpiece from contact with said shoes.

2,772,527
COUPLER FOR CRANK SHAFT GRINDER
Roy A. Fontaine, La Grande, Oreg.
Application September 21, 1953, Serial No. 381,169
3 Claims. (Cl. 51—237)

1. In combination, a lathe having a headstock, a plate on said headstock, an eccentrically located crank pin on said plate, an automotive crank shaft mounted in said lathe for grinding, an end flange on said crank shaft, a plurality of identical bolt holes in said end flange, said end flange engaged by said headstock, a pair of members forming a composite coupler between said headstock and said flange, said members secured together near their adjacent ends in a position of angularity with respect to each other, an aperture near an end of one of said members, said aperture having the same diameter as said crank pin and engaged by said crank pin, a flange-engaging pin rigidly secured in said first mentioned member and in engagement with one of said bolt holes, a second similar flange-engaging pin adjustably mounted in said other member and in engagement with another of said bolt holes, said flange-engaging pins being of smaller diameter than said bolt holes, means in said other member for moving said second flange-engaging pin towards said first member, and said means so adjusted that said flange-engaging pins will be forcibly urged relatively towards each other, whereby any play between said members and said flange is prevented.

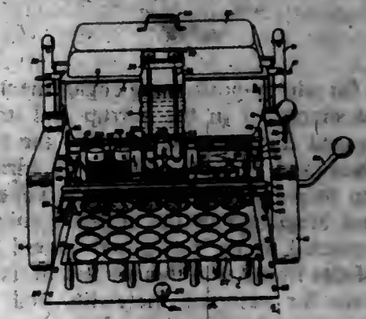
2,772,528
METAL SAWING TABLE
Harry C. Elce, Pittsburgh, Pa.
Application January 9, 1956, Serial No. 558,068
5 Claims. (Cl. 51—249)



1. A table for metal sawing beneath a saw, comprising a pair of horizontal platens disposed side by side in laterally spaced relation and adapted to support a metal plate extending across the space between them while a rotary saw above said space is moved lengthwise thereof to cut the plate, means above one of said platens to clamp the plate thereon, means to clamp the plate on the other platen,

means pivotally mounting the inner edge of said other platen on a horizontal axis, and means for lowering the outer edge of said pivoted platen to bend the plate between the platens, whereby to spread the saw cut to prevent the saw from binding therein.

2,772,529
CYLINDER BLOCK RIDGE GRINDER
Claude O. Deitz, Joplin, Mo.
Application November 12, 1952, Serial No. 319,870
2 Claims. (Cl. 51—245)



1. A ridge grinding device for the cylinders of engine blocks comprising a body member, centering members carried by said body member and operable to engage slidably the walls of a cylinder into which said body member is inserted, whereby to support said body member for free rotational and axial movement in said cylinder, and a grinding wheel carried rotatably by said body member and positioned to grind the wall of a cylinder in which said body member is positioned, the axis of said grinding wheel being disposed eccentrically to the axis of said body member and inclined slightly relatively thereto in a plane at right angles to the direction of eccentricity thereof, at least certain of said centering members being provided with resilient means urging them radially outwardly relative to the body member, whereby they may be pressed inwardly to permit the insertion of the body member into a cylinder when the wall of said cylinder is ridged.

2,772,530
APPARATUS FOR FORMING, FILLING AND SEALING BAGS
Victor G. Williams, Toronto, Ontario, Canada, assignor to Delamere & Williams Company, Limited, West Toronto, Ontario, Canada, a corporation of Ontario
Application January 30, 1953, Serial No. 334,171
8 Claims. (Cl. 53—180)

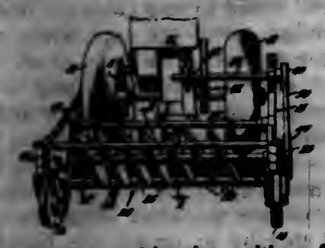
1. In a bag-making and filling machine of the character described, in combination, an endless carrier including a plurality of grippers for continuously advancing a longitudinally folded strip of bag-forming material into operative relation to bag forming, filling and closing mechanism, and auxiliary sealing means for sealing the contacting faces of the folded strip along the folded marginal edge only thereof during said continuous advance and prior to being engaged by said gripper carrier, said auxiliary sealing means including a pair of cooperating heat-sealing rollers engageable with said folded marginal edge during the continuous advance thereof, and a pair of coopertaing guide rolls immediately preceding said heat-sealing rolls to guide and maintain the sides of the folded strip in face to face contact during said sealing operation, said marginal seal serving to reinforce said folded edge to prevent rupture thereof during subsequent bag-forming and filling operations.

2,772,531
FILLING AND CAPPING APPARATUS FOR CONTAINERS OF LIQUIDS
Frank Brodsky, Brooklyn, N. Y.
Application August 16, 1954, Serial No. 449,886
4 Claims. (Cl. 53—283)

1. A filling machine for filling containers with cream and other liquids, comprising a reservoir for a liquid, a plurality of liquid metering and dispensing cups disposed underneath the reservoir, a like number of inlet openings formed in the bottom of the reservoir through which the liquid may flow into said cups, outlet openings formed in the bottom of said cups through which the liquid may flow out of said cups, a valve member mounted in each said cup for vertical movement therein, said valve members having a lower position in which they close the outlet openings and open the inlet openings and having an upper position in which they close the inlet openings and open the outlet openings, said valve members being normally gravity-held in their lower positions to permit liquid to flow from the reservoir through the inlet openings to fill the cups while preventing the liquid from flowing out of the cups, an air vent tube connected to each said valve member, said tubes projecting upwardly through said inlet openings and through the liquid in the reservoir, means for advancing rows of empty containers in succession to positions underneath the outlet openings in said cups, and lifting means connected to said tubes to elevate the valve members to their upper positions and thereby to permit the liquid in the cups to flow out through the outlet openings and to fill the containers while preventing a flow of liquid from the reservoir and into the cups through the inlet openings.

2,772,532
SAFETY STIRRUP
Jack L. Tann, Castro Valley, Calif.
Application April 19, 1951, Serial No. 221,892
2 Claims. (Cl. 54—49)

1. In a safety stirrup, a U-shaped support frame having first and second depending sides, a U-shaped foot-piece having the extremity of one side hinged to the extremity of the first frame side and having the extremity of its



other side normally abutting the extremity of the second frame side in complementary relation thereto, a releasing yoke disposed between said frame sides, first and second hinge pins extending outwardly from the yoke ends and respectively through the first and second frame sides in journalled relation thereto, said yoke comprising a longitudinally arched member for overlying an appreciable length of the instep of a foot normally engaged through the foot-piece and having mutually spaced forward and rearward foot-contacting edges normally disposed at opposite sides of the plane of the frame and respectively provided by a forward section which is longitudinally attached to the frame and a rearward section mounted on the forward section for its fore-and-aft adjustment with respect to the forward section to variably space said forward and rear yoke edges with its said rearward edge

arranged for stirrup-positioning engagement with the front of a foot supported in the stirrup and its said forward edge arranged for its engagement by the top of the foot when it is rocked backwardly from its normal disposal in the stirrup to rearwardly displace the yoke, means fixing the second hinge pin to the engaged yoke end, a hook member carried by the latter said second hinge pin outwardly of the frame side thereat and in fixed radial relation thereto for swinging therewith, and a support pin carried by an outer side of the foot-piece in the path of movement of the hook member and normally engaged by the latter for maintaining the abutment of the second end of the foot-piece with the opposed end of the second frame side, said hook member being releasable from the engaged pin upon said rearward displacement of the yoke by a rider's foot.

2,772,533
**MOWER HAVING LEDGER PLATE WITH COOPERATING WOBBLE PLATE CUTTER**
Harry B. Shibley, Jr., Coffeyville, Kans.
Application January 17, 1955, Serial No. 482,088
1 Claim. (Cl. 56—252)

In a mower, the combination with a frame, of a stationary cutting member mounted in said frame and extending transversely thereof, said stationary cutting member being formed to provide a continuous series of forwardly projecting teeth, a rotating cutting member supported in said frame and extending transversely thereof, said rotating cutting member being disposed above said stationary cutting member and comprising a shaft mounted at its ends for rotation in said frame and a plurality of cutting discs mounted in spaced relation on said shaft for rotation therewith, the planes defined by said discs forming an acute angle with the axis of said shaft, said discs being of generally elliptical contour to establish and maintain engagement with the toothed portion of said stationary cutting member as said shaft rotates, whereby the zone of contact between each disc and the said toothed portion is displaced laterally of said frame in opposite directions during rotation of said shaft, the toothed portion of said stationary cutting member being shaped to provide on its upper side a continuous groove extending in parallel relation with said shaft, said groove being shaped to conform to and engage with a substantial length of the periphery of the said discs.

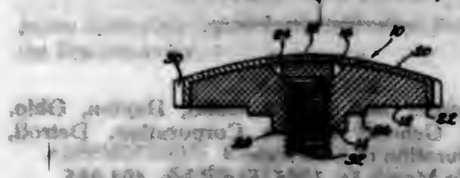
2,772,534
**FRUIT PICKER HAVING A PLURALITY OF PIVOTED KNIFE CARRYING FINGERS**
Savin J. Tarullo, Santa Cruz, Calif.
Application September 8, 1954, Serial No. 454,793
4 Claims. (Cl. 56—335)

1. A fruit picker comprising a staff, a ring rigidly secured to the top end of said staff and projecting outwardly therefrom, a flexible receiving member secured to said ring, a plurality of upwardly extending fingers pivoted to said ring, a bell crank lever having an outer arm and an inner arm projecting from one end of the outer arm, said lever being at the one end of the outer arm pivoted to said staff adjacent said ring, cable means connected to the other end of the outer arm of said lever and arranged to rotate the lever, and means connecting the inner arm of said lever to said fingers and being arranged to rotate said fingers inwardly towards each other responsive to rotation of said lever.

---

2,772,535
**RINGS FOR SPINNING MACHINES**
Norio Kobayashi, Kami Kyo-ku, Kyoto City, Japan
Application May 16, 1951, Serial No. 226,607
Claims priority, application Japan June 19, 1950
2 Claims. (Cl. 57—119)



1. A ring for ring spinning machine, which comprises an external body portion of plane cylindrical shape, a rounded top periphery and an inwardly projecting flange formed below said top periphery and having a rounded apex, which is formed by connecting said rounded top periphery and said rounded apex of said inwardly projecting flange to each other by an inverted substantially conical surface, said inner flange being so determined with relation to a traveler, which has a substantially semicircular stem portion and two legs bent toward each other to leave an opening therebetween, that said traveler can

be retained on said ring by said rounded top periphery and the rounded top of said inwardly projecting flange during running of the traveler on the ring leaving a definite clearance between the end of the outer leg of the traveler and the outer surface of the ring, thereby preventing scratching the outside wall of the ring by the top of the outer leg of the traveler.

2,772,536
**WATCH CROWN AND METHOD OF ASSEMBLY**
Edward L. Shafran, Chicago, Ill.
Application September 8, 1953, Serial No. 378,763
11 Claims. (Cl. 58—88)

1. A crown assembly comprising a crown member having a bore therethrough, a cap member positioned on said crown member, said cap and crown members defining a cavity in communication with said bore, and a mass of bonding material positioned in said cavity.

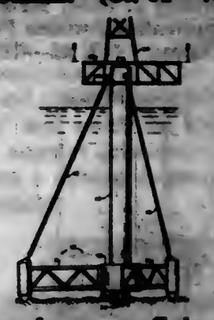
---

2,772,537
**FLAME AND SPARK ARRESTER**
Constantine Lieiani, Chicago, Ill., assignor to The Protectoseal Company, Chicago, Ill., a corporation of Illinois
Application February 4, 1953, Serial No. 335,131
4 Claims. (Cl. 60—31)

1. As an article of manufacture, an elongated polygonal-shaped tubular casing for a flame arrester comprising an adapter for detachably mounting the flame arrester on a combustible gas conduit at one end and for detachably mounting retainer means for the polygonal-shaped tubular casing on the opposite end, said polygonal-shaped tubular casing complementally formed to the adapter, said polygonal-shaped tubular casing comprising detachable and flanged symmetrical halves about the diagonal through the cross-section of the polygonal-shaped tubular casing at right angles to the longitudinal axis of the polygonal-shaped tubular casing, said flanged symmetrical halves assembled with the flanges thereof in abutting relationship and said polygonal-shaped tubular casing extending longitudinally to a predetermined length greater than the smallest cross-sectional dimension of the polygonal-shaped tubular casing, said polygonal-shaped tubular casing adapted to receive heat exchange members forming a plurality of longitudinally extending passageways in heat exchange relationship with respect to the combustible gas to be discharged therethrough, and said flanges of said symmetrical flanged halves forming the tubular casing being intermediate the ends of said tubular casing and less than the length of the tubular casing.

---

2,772,538
**BLADE FORMATIONS FOR TURBO-MACHINES**
Fred E. Ulbery, Detroit, Mich.
Application July 12, 1952, Serial No. 298,560
32 Claims. (Cl. 60—54)

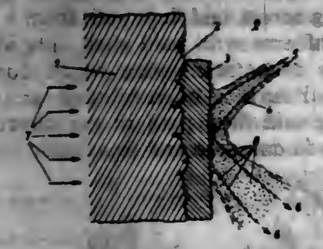


1. In a turbo-machine in which shell and core shroud elements have respective surfaces of revolution formed and arranged about a common axis so as to bound therearound an annular fluid path which has a curving trend in a cross-section cut by a plane containing said axis, a bladed member which occupies at least an annular portion of said annular fluid path and thereat comprises: an annular array of blades circumferentially distributed in said fluid path around said axis, each of said blades being disposed with a blade surface of configuration thereof spanning across said fluid path from a shell-stream edge which conforms with said shell shroud surface of revolution to a core-stream edge which conforms with said core shroud surface of revolution and thereacross extending along said fluid path in the direction of fluid flow from a blade entrance end to a blade exit end; and,

blade support means connecting said blades together in circumferentially spaced and fixed relationship with each other, said blade support means being adapted to transmit torque concurrent with utilitarian blade action change of moment of momentum of passing fluid; and in which, the blade features of each of a plurality of said blades include across said fluid path a blade surface of configuration disposition which across a mid-stream path midway between said shell-stream edge and said core-stream edge is a bias disposition for which at each point along said mid-stream path from the blade entrance end to the blade exit end the bias angle is vectorially positive and has a magnitude of at least 10 degrees.

---

2,772,539
**FOUNDATION FOR OFF-SHORE DRILLING RIG**
William Andrew Sandberg, South Pasadena, Calif.
Application January 18, 1951, Serial No. 206,583
6 Claims. (Cl. 61—46.5)



1. A foundation for one off-shore well-drilling rig comprising a metallic cylinder of length exceeding the depth of water at the location of use and of substantially uniform diameter throughout its length, one end of said cylinder being closed and formed to spherical arcuate curvature and being weighted to cause the cylinder to float in an inclined position, the other end of said cylinder being provided with a removable closure and with means for controllably introducing and expelling water, a base member consisting of a hub element having an annular seat with a concave surface mating the curved end of said cylinder and a plurality of rigid legs projected radially from said hub element and formed to engage the ocean floor at their extremities only and to support said hub element free from said floor, a conductor pipe axially disposed within said cylinder, and a plurality of tubular piling guides within said cylinder and spaced around its inner wall, said guides and conductor pipe extending through the curved end of said cylinder and sealed therein and registering with openings formed in said hub element.

2,772,540

## COOLING PROCESS AND DEVICE FOR THE PERFORMANCE OF SAME

Paul Vierhöller, Genoa-Nervi, Italy

Application January 19, 1953, Serial No. 331,860
Claims priority, application Switzerland January 23, 1952
8 Claims. (Cl. 62—1)

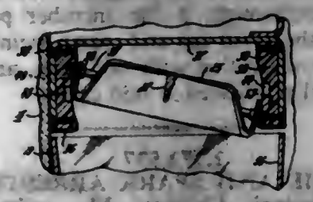
1. The process of cooling a metallic surface having an affinity for mercury, comprising the steps of spraying mercury obliquely onto first spaced areas of said surface to cause said mercury to rebound obliquely from said first areas of said surface, directing water toward second spaced areas of said surface located adjacent the paths of movement of said rebounding mercury, whereby said rebounding mercury deflects said water from its original path of movement and substantially screens said second areas from said water, thus effectively preventing said water from contacting said surface, collecting both said mercury and said water together, whereby heat removed from said surface by said mercury is in turn removed from the latter by said water, separating said mercury and said water from each other, and recirculating the same independently of one another for further cooling of said surface.

2,772,541

## HINGED CLOSURE MEMBER FOR LOW TEMPERATURE COOLING COMPARTMENTS

Ragnar Edvard Denfors, Stockholm, Sweden, assignor to Aktiebolaget Elektrolux, Stockholm, Sweden, a corporation of Sweden

Application February 2, 1954, Serial No. 407,720
Claims priority, application Sweden February 6, 1953
15 Claims. (Cl. 62—103)



1. In a refrigerator comprising a cabinet including a thermally insulated interior providing a compartment having an access opening, cooling means for cooling said compartment below the freezing temperature of water to maintain the latter as a freezing space, a closure member in the thermally insulated interior for closing the access opening, structure including a plurality of elements in spaced apart relation for mounting said closure member for pivotal movement about a first horizontal axis passing through first regions of said elements and for mounting said elements for pivotal movement about a second fixed horizontal axis passing through second regions of said elements removed from said first regions, resilient means for effecting pivotal movement of said closure member about the first horizontal axis to bias said closure member to its closed position at the access opening, locating means for maintaining said first horizontal axis at a substantially definite position when pivotal movement of said closure member about said first axis is essentially unobstructed in the act of gaining access to said compartment, and said structure being operable to effect pivotal movement of said closure member about said second horizontal axis when a pulling effort greater than normal is required to open said closure member, especially when parts of said closure member at the vicinity of said first axis may be subject to formation of frost or ice.

2,772,542

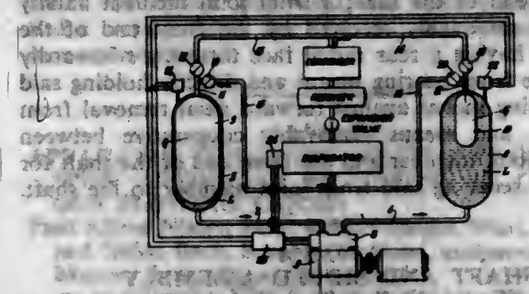
## ICE TRAY

Richard S. Gaugler and Robert Gaiss, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application March 14, 1955, Serial No. 494,085
12 Claims. (Cl. 62—105)

1. In combination, an elongated support having an open end, a unitary freezing device including a distortable tray and a plurality of rigid walls therein, said rigid walls having a point of loose attachment to said tray for movement with respect thereto, said loose attachment point of said walls to the tray locking said walls therein against removal therefrom, said walls dividing the interior of said tray into compartments in which water is to be frozen into separated ice blocks, said tray of said device and walls located therein together with ice blocks in said compartments being insertable as a unit into said elongated support in an inverted position through the open end thereof, means on the tray of said unitary device for engaging portions of said support, said means cooperating with said portions of said support and rendered effective automatically in response to moving said device in one direction along said support for flexing and imparting a twist to said tray to bodily shift said walls relative thereto about their loose attaching points and break the bond between ice blocks and their compartments, and means rendered effective by continued movement of said device in said one direction along said support beyond the position of said device at which the tray thereof is twisted for quickly releasing the torsion of said tray while the device is supported in said support to flip ice blocks out of said unitary freezing device.

2,772,543

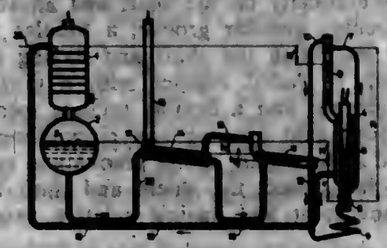


## MULTIPLE HYDRAULIC COMPRESSOR IN A REFRIGERATION SYSTEM

Frank Berry, Carlisle, Mass.

Application March 24, 1953, Serial No. 344,359
1 Claim. (Cl. 62—115)

In a refrigeration system, two reservoirs for expanded refrigerant, said reservoirs being directly connected to a condenser and evaporating system, a hydraulic pump connected to said reservoirs for pumping liquid out of one of said reservoirs through the pump and directly into the other of said reservoirs and alternately to return liquid from said other reservoir to the first reservoir, each reservoir arranged to receive expanded refrigerant from the condenser and evaporating system when said hydraulic pump is removing liquid from said reservoir and transferring said liquid into the other reservoir, and each reservoir further arranged to deliver compressed refrigerant to the condenser and evaporating system when said hydraulic



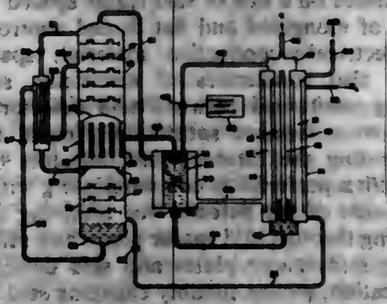
pump is forcing liquid from said other reservoir back into the first reservoir.

2,772,544

## ABSORPTION REFRIGERATING APPARATUS EMPLOYING INERT GAS

Alvar Leaning, Stockholm, Sweden, assignor to Bolinders Fabriks Aktiebolag, Kallhäll, Sweden, a corporation of Sweden

Application November 16, 1953, Serial No. 392,379
Claims priority, application Sweden November 21, 1952
2 Claims. (Cl. 62—119.5)



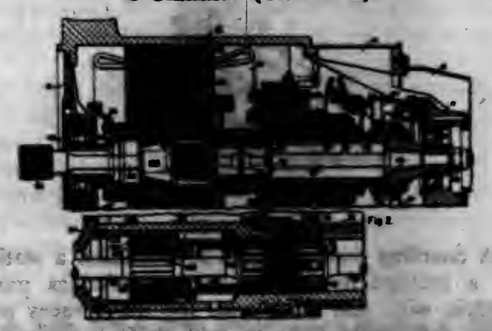
1. In absorption refrigerating apparatus operating with inert gas and comprising a boiler, a thermo-syphon for elevating absorption liquid into the boiler, an absorber, a conduit for weak solution leading from said boiler to said absorber, and an analyzer in which hot vapour from the boiler is brought into direct contact with rich solution, that improvement which consists in conveying hot vapour from said analyzer into a separate vessel in which the vapour gives off condensate in the process of being cooled by rich liquid, through the intermediary of said condensate, the cooling rich solution being then conducted to the analyzer through a conduit which is in heat exchanging relation to said conduit for the weak solution.

2,772,545

## LIQUEFIED GAS PRESSURIZING SYSTEMS

James J. Shanley, Bethesda, Md., assignor to Air Products, Incorporated, a corporation of Michigan

Application May 13, 1952, Serial No. 287,650
23 Claims. (Cl. 62—122)



1. The method of transferring in liquid phase liquefied gas at its boiling point from a supply reservoir where it is held at a low pressure to a receiving chamber under a relatively high pressure, which comprises conducting under the influence of gravity liquefied gas from the supply reservoir to a transfer zone at a level lower than the supply reservoir, establishing a pressure in the transfer zone corresponding to the relatively high pressure, conducting liquefied gas under the influence of gravity in the transfer zone to the receiving chamber, and passing a relatively cold fluid in heat exchange relation with the transfer zone to reduce the pressure in the transfer zone to the low pressure after the liquefied gas has been conducted from the transfer zone and then placing the transfer zone in communication with the supply reservoir, the relatively cold fluid being at least as cold as the low pressure liquefied gas.

2,772,546

## FLEXIBLE DRIVE

Robert C. Barrows, Lima, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application August 17, 1955, Serial No. 529,009
6 Claims. (Cl. 64—1)

1. In combination, a hollow driven shaft, a first torsionally resilient spindle extending from one end of said shaft partially through said shaft, a second torsionally resilient spindle extending from the end of said first spindle to the other end of said shaft, means for rigidly connecting one end of said first spindle to one end of said shaft, means for effecting a driving connection between adjacent ends of said first and second spindles comprising, spline teeth on adjacent ends of said first and second spindles, a tubular member having internal splines axially positioned so as to bridge the adjacent ends of said first and second spindles and engage the spline teeth on both of said ends, the engaging teeth having relatively large angular clearance therebetween, and means for effecting a driving connection at the other end of said second spindle.

2,772,547

## UNIVERSAL JOINT AND BUSHING REPLACEMENT ASSEMBLY FOR A DRIVE SHAFT ASSEMBLY

Patrick R. Nolan, Oklahoma City, Okla., assignor of one-half to M. W. Cooper, Oklahoma City, Okla.

Application June 29, 1955, Serial No. 518,800
5 Claims. (Cl. 64—1)

1. In a motor vehicle of the type having a drive assembly including a torque tube and a drive shaft, having a splined forward end with the drive shaft positioned in the torque tube, a universal joint and bushing replacement assembly comprising a bushing sleeve, an oil seal mounted in the inner end of said sleeve and adapted to directly encompass a drive shaft inwardly of the splined end, a bushing mounted in the outer end of said sleeve, a second bushing mounted in said sleeve intermediate

the ends thereof, and a tubular universal joint member supported in said bushings, said member having a length greater than the extent of the splines on said drive shaft and having a bore internally splined from the forward end thereof a distance less than the extent of the splines on said drive shaft with the unsplined rear portion of said bore having a diameter to permit said unsplined bore to engage over the drive shaft beyond the splined end thereof whereby said member may be longitudinally adjusted in use a substantial distance while maintaining contact with both of said bushings.

2,772,548
COUPLING
Robert A. Covington, Jr. and Vincent H. Waldin, Wilmington, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Application April 7, 1955, Serial No. 499,775
2 Claims. (Cl. 64—2)

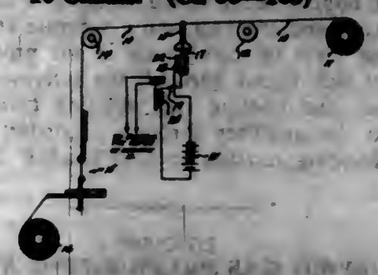
1. A coupling comprising in combination a stationary shaft, a multiplicity of anti-friction bearings mounted concentric with said shaft with the inner races of said bearings sufficiently tight to said shaft to remain substantially immovable with respect to said shaft under load applied to the coupling, spacer elements disposed between adjacent bearings, and individual sleeves fixedly attached to the outside peripheries of the outer races of said bearings, said sleeves being provided with cooperating power-transmitting means along adjacent faces.

---

2,772,549
SAFETY-SHIELDED POWER-TRANSMITTING ASSEMBLY
Roy E. Harrington, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application January 20, 1955, Serial No. 483,125
10 Claims. (Cl. 64—4)

1. A safety-shielded power-transmitting assembly of the character described, comprising: a shaft of fixed length having front and rear ends; a rear joint member fixed to said rear end and having a front radial face; axially forwardly removable rear bearing means encircling and supported on the shaft ahead of and thrusting rearwardly against said front radial face; an axially forwardly removable safety tube loosely and concentrically surrounding the shaft and having front and rear ends respectively proximate to the front and rear ends of the shaft; rear race means on the rear end of the tube and including a rear thrust ring thrusting rearwardly against the rear bearing means and an adjacent rear radial-load ring received by said rear bearing means to journal the rear end of the tube; front race means on the front end of the tube and including a forwardly facing front thrust ring and an adjacent front radial load-ring loosely encircling the front end of the shaft; front bearing means encircling and supported on the front end of the shaft for free axially slidable removal from the shaft in a forward direction and normally thrusting rearwardly against the front thrust ring and received by the front radial-load ring to journal the front end of the tube; a front joint member axially forwardly removably received by the front end of the shaft and having a rear radial face thrusting rearwardly against the front bearing means and directly holding said front bearing means against forward axial removal from the shaft; and means removably cooperative between the front joint member and the front end of the shaft for releasably securing said front joint member to the shaft.

---

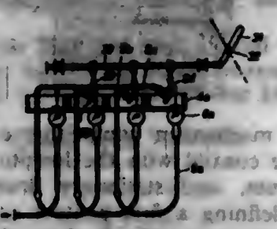


2,772,550
SHAFT AND SHIELD ASSEMBLY
Roy E. Harrington, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application September 2, 1955, Serial No. 532,150
7 Claims. (Cl. 64—4)

1. A power shaft assembly, comprising: a shaft; means concentrically on the shaft and affording an externally opening annular groove; a tubular shield concentrically encircling the shaft and having an opening therethrough in radial register with a portion of the aforesaid groove; and a flexible arcuate member introduced through said opening and circumferentially into and around at least part of the groove and engaging the shield to interconnect the shield and shaft for relative angular movement and against relative axial displacement.

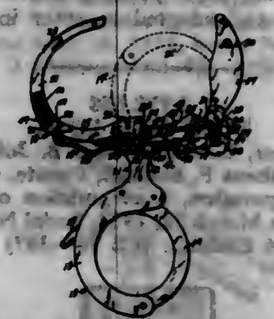
---

2,772,551
STOP MOTION FOR FABRIC MAKING MACHINES
Sidney V. Hess, Jr., West Orange, N. J., assignor to Bonnell Mills, Incorporated, New York, N. Y., a corporation of New York
Application July 24, 1953, Serial No. 370,162
10 Claims. (Cl. 66—163)



1. A device for automatically stopping warp knitting and similar machines for making mesh fabrics in case of rupture of one or more threads, comprising, a frame, a busbar mounted on a side of said frame spaced therefrom, a plurality of elongated and flat thread controlled detectors of electrically-conductive material, spacer plates which are also conductors of electricity, said spacer plates being positioned between said detectors to space said detectors a distance substantially equal to the distance separating the threads, said detectors each being provided with a perforation communicating with an opening on the side of the detector for receiving a thread, a bar extending through said spacer plates and said detectors for holding said spacer plates and said detectors in assembled relation, means slidably engaging said frame and said busbar for lifting said detectors so that the aforesaid thread receiving openings are positioned just below the tops of said spacer plates during the threading up of said detectors, and connections for connecting said busbar to one side of an electric circuit and connections for connecting said frame to the other side of said circuit, said detectors being adapted to close the electric circuit between said busbar and said frame when a thread breaks and a corresponding one of said detectors drops to contact said busbar.

---



2,772,552
APPARATUS FOR AFTERTREATMENT OF FRESH-SPUN ARTIFICIAL FILAMENTS IN CONTINUOUS FLOWING LIQUID
Paul Alfred Nikles, Bern, Robert Steiger, Muri, near Bern, and Guido Bach, Bern, Switzerland, assignors to Ing. A. Maurer S. A., Bern, Switzerland
Application May 4, 1950, Serial No. 159,892
Claims priority, application Switzerland May 5, 1949
3 Claims. (Cl. 68—181)

1. An apparatus for the continuous wet treatment of fresh spun artificial filament by passing it through a conduit in contact with an aftertreatment liquid comprising a tubular conduit for the treatment of the filament in a continuously flowing stream of the aftertreatment liquid, means for directing the filament into and out of said conduit, means for conveying the filament through said conduit by the action of said liquid comprising a pressure means for forcing said liquid through said conduit in the direction of flow of said filament, and means for facilitating the treatment of said filament and guiding it along the central portion of the conduit and within the liquid therein comprising a section of restricted cross sectional area and a means on said conduit for repeatedly opening the fiber bundle, constituting said filament, comprising sections of enlarged cross sectional area intermediate the ends of the conduit.

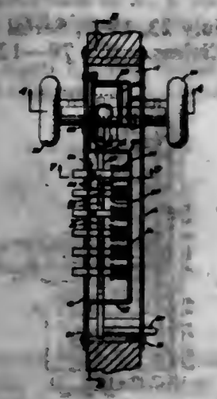
---

2,772,553
HANDCUFFS
Alfred J. Howe, Oakland, Calif.
Application May 10, 1954, Serial No. 428,689
4 Claims. (Cl. 70—16)

1. A retractile handcuff comprising a lockarm, a guard, a retractile link retractable within said guard and having one end pivoted therein, and a locking link having one end pivoted to the other end of said retractile link, said retractile link having a depending finger extension from said one end, a latch member slidable to two positions and a spring urged plunger cooperative therewith for sliding said latch member to one position for engagement of one end under said depending finger extension for locking said retractile link in retracted position, and a trigger pivoted in said guard and having a cam edge cooperative with the other end of said latch member for retracting said latch member to the other position against the urgence of said spring-urged plunger when said trigger is depressed for releasing said retractile link, and a spring cooperative between said guard and said retractile link for projecting said retractile link outwardly about its pivot to engage said locking link in said lock arm when said latch member is retracted through depression of said trigger, and resiliently actuated retaining means cooperative between said retractile link and said locking link for normally retaining said locking link in open position for direct cooperation with said lockarm.

---

2,772,554
LOCKING MEANS FOR A DOOR CONSTRUCTION
Louis L. Schacht, New York, N. Y., assignor to Schacht Associates, Inc., New York, N. Y., a corporation of New York
Application July 22, 1952, Serial No. 300,217
4 Claims. (Cl. 70—120)



1. A lock for a door construction having a vertically extending hollow stile and a horizontally disposed hollow frame member intermediate the ends theerof, comprising actuating means disposed in said frame member and having a lever mounted for pivotal movement about a horizontal pivot axis disposed in said frame member and laterally spaced from said stile, said lever having an end part extending to said stile, an axially reciprocable member disposed in said hollow stile and operatively connected to said lever end part, and locking elements operatively connected to end portions of said reciprocable member and adapted for simultaneous extension and retraction in response to the axial reciprocation of said reciprocable member, the extended position of said locking elements constituting the locked position thereof and the retracted position of said locking elements constituting the unlocked position thereof, the actuation of said actuating means being effective to pivot said lever about said axis to correspondingly actuate said reciprocable member and said locking elements, and locking means disposed in said frame member at the opposite side of said pivot axis to said stile and operatively associated with said actuating means for controlling the actuation thereof.

---

2,772,555
KEYLESS COMBINATION PUSH BUTTON DOOR LOCK
Hurley H. Smith, Elkhart, Ind.
Application August 7, 1953, Serial No. 373,006
2 Claims. (Cl. 70—153)

1. A combination lock comprising a face plate adapted to be secured vertically to a door adjacent one edge of the door, a horizontally extending bolt housing secured to said plate, a bolt slidably mounted in said housing and being arranged to at times project outwardly from said edge, spring means biasing said bolt outwardly, an operating shaft extending transversely into said housing, said bolt being formed with a recess receiving said shaft, a first projection on said shaft engageable with a wall of said recess to retract the bolt responsive to rotation of said shaft, a second projection on said shaft normally depending therefrom, a bracket member secured to said

plate, a vertical locking bar slidably engaged with said bracket member for vertical sliding movement, means on said bar lockingly engageable with said second projection to lock said shaft against rotation when the bar is elevated, a plurality of vertically spaced, upwardly tapered locking lugs on said bar, respective horizontal plunger elements slidably mounted in said plate and said bracket member and being disposed between adjacent locking lugs, said plunger elements being disposed at opposite sides of the locking bar out of the path of said bar, spring means biasing said plunger elements outwardly through said plate to predetermined normal positions, a pin element on each plunger element projecting laterally from the plunger element in the direction of said locking bar, a second pin element on each plunger

element projecting laterally from the plunger element in a direction away from the locking bar, the pin elements of each plunger element being spaced longitudinally of their associated plunger element, and some of the first named pin elements being normally disposed between adjacent locking lugs of the locking bar, the remaining ones of the first named pin elements being located normally forwardly of the locking bar and being movable between adjacent locking lugs when their associated plunger elements are pushed inwardly, said plunger elements being removable from the plate and bracket member and being rotatable through 180° before being returned to position, to dispose the second named pin elements in positions in which they project in the direction of the locking bar, when said combination is to be changed.

---

**2,772,556**
**BARREL LOCK**
**Bernhard Nickel, Marburg (Lahn), and Ernst Rilld, Ruttershausen, Germany**
**Application February 16, 1952, Serial No. 272,002**
**Claims priority, application Germany February 17, 1951**
**4 Claims. (Cl. 70—358)**

1. A barrel lock comprising two cylinders concentrically mounted for relative rotation one within the other and having two part locking pins arranged radially in pairs in bores in the cylinders and in at least one radially arranged row, and a key comprising a sleeve having a rod axially movable therein and a plurality of control pins radially movable through bores in the sleeve with a control pin for each of the pairs of locking pins, said rod having cam surfaces spaced intermittently by normal surfaces so that when the control pins are in contact with the cam surfaces the key may be removed out of the inner cylinder with the cylinders in locked position and when the normal surfaces are in contact with the control pins the latter actuate the locking pins whereby the latter are adjusted in the bores in the cylinders so that the locking pins will unlock the cylinders and rotation of the key will permit rotation of the inner cylinder.

---

**2,772,557**
**CYLINDER LOCK MECHANISM**
**Adolfo Fernandez Andrito, Rafaela, Argentina**
**Application June 6, 1955, Serial No. 513,531**
**4 Claims. (Cl. 70—363)**

1. A lock mechanism comprising a stationary drum having a bore coaxial with the longitudinal axis of said stationary drum, said stationary drum further having a first base defining a first contact surface having first revolutionary irregularities, a first plurality of spaced apart, substantially radially alined perforations in said first drum and open to said first contact surface, a plurality of springs of which one spring is housed in each of the perforations of said first plurality of perforations, a plurality of pins of which one pin is mounted on each of said springs, said pins being adapted to project out of said perforations, a rotatable drum having a second base defining a second contact surface having second revolutionary irregularities complementary to said first revolutionary irregularities and in rotary sliding contact therewith, a shaft integral with said rotatable drum and projecting through said bore and rotatably supported thereby, a second plurality of spaced apart, substantially radially alined perforations open to said second contact surface and adapted to face said first plurality of perforations, said rotatable drum further having a third base defining a front face, a key slot in said front face, a key way in said movable drum connecting said key slot with said second plurality of perforations, said plurality of pins being capable of entering said second plurality of perforations and facing said key way, and a key for said lock mechanism having a front end portion of complementary shape to the corresponding portion of said first contact surface and adapted to enter in contact therewith.

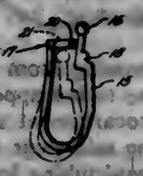
**2,772,558**
**PUSH KEY LOCK**
**Edgar J. Gardner, Glendale, Paul B. Johnson, Los Angeles, and Alphous F. Stansell, Pasade, Calif., assignors to Clary Corporation, a corporation of California**
**Application March 31, 1953, Serial No. 345,914**
**6 Claims. (Cl. 70—387)**



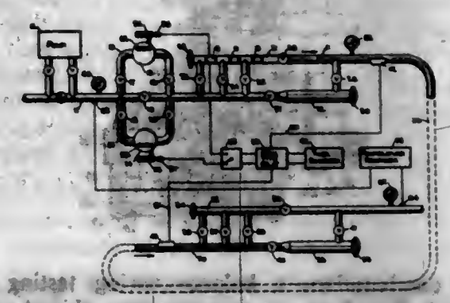
1. A key controlled device comprising the combination of means forming a keyway for guiding a key for longitudinal movement, a movable actuator element, a stationary element, said elements having a plurality of slots therein, said slots extending transversely to the direction of movement of said actuator element, a spring extending between said elements for normally maintaining said actuator element in position to align the slots

therein with the slots of said stationary element, a plurality of tumblers slidable in said slots, said spring yieldably engaging said tumblers whereby to normally maintain said tumblers conjointly in the slots of both said elements to prevent movement of said actuator element, said tumblers having holes extending therethrough, said key being engageable with the edges of said holes in said tumblers upon insertion a predetermined amount whereby to move said tumblers out of the slots in said stationary element, and means operable by said key upon further movement thereof for moving said actuator element.

---

**2,772,559**
**KEY HANGER FOR KEY CASES**
**Clyde E. Morrell, Southbridge, Mass., assignor to Buxton, Incorporated, Springfield, Mass., a corporation of Massachusetts**
**Original application May 17, 1951, Serial No. 226,870, now Patent No. 2,657,568, dated November 3, 1953. Divided and this application September 14, 1953, Serial No. 379,863**
**1 Claim. (Cl. 70—458)**

A key hanger formed of organic synthetic plastic unitarily molded in the form of a loop, one end of said loop being provided with an enlarged head and a shoulder spaced therefrom of greater transverse dimension than the head, the other end of the loop being provided with a projection extending substantially at right angles thereto in the direction of the other end portion of the loop and formed with an aperture dimensioned to permit passage of said head therethrough but not said shoulder, the portion of said loop intermediate said projection and shoulder possessing sufficient resilience and flexibility to permit distortion of the loop away from the projection a distance at least equal to the distance between the shoulder and free end of the head to permit the latter to be inserted through and withdrawn from said aperture.



---

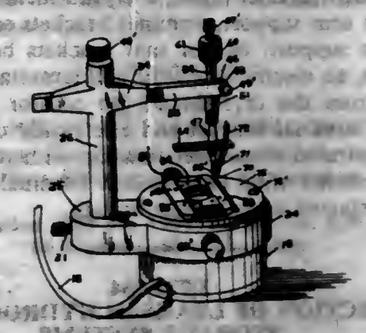
**PICK-UP DEVICE FOR PRE-CAST CONCRETE SLABS**
**Herman P. Neptune, Los Angeles, Calif.**
**Application June 28, 1952, Serial No. 296,208**
**3 Claims. (Cl. 72—105)**

1. In a concrete slab having a plurality of reinforcing rods therein, said rods having a space therebetween, an anchoring device comprising a nut having spaced first and second faces, an axially threaded bore in the nut passing through said faces, the first face of said nut bearing against a plurality of said rods with the threaded bore being accessible through the space therebetween, said second face having a plurality of elongated wire retaining elements secured thereto, said retaining elements having means at the ends thereof engaging said rods at points thereon spaced from said nut and clampingly securing said first face against said rods.



**2,772,561**
**APPARATUS FOR CALIBRATING FLOWMETERS**
**Norris Plastic, East Chicago, Ind., and Sydney S. Smith, Scarsdale, N. Y., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware**
**Application August 18, 1953, Serial No. 374,945**
**5 Claims. (Cl. 73—3)**

1. Apparatus for calibrating an indicating flowmeter in a pipeline comprising plug means insertable in said pipeline to form a movable seal within said pipeline, said plug means being adapted to be propelled through said pipeline by the flowing fluid at the velocity thereof, first and second signal means mounted in longitudinally spaced relationship at predetermined points in said pipeline, said signal means being adapted to be actuated by the arrival of said plug means thereat, and electrical circuit means connecting said first and second signal means with said flowmeter, whereby said indicating flowmeter is energized by the arrival of said plug means at said first signal means and de-energized by the arrival of said plug means at said second signal means.

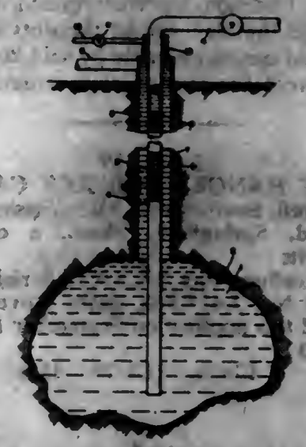
**2,772,562**
**WATCH BALANCE SPRING TESTING DEVICE**
**George T. Kuwada, New York, N. Y.**
**Application October 15, 1953, Serial No. 386,192**
**8 Claims. (Cl. 73—6)**

1. A watch balance spring testing device comprising a sound box structure having a transmitter therein, a post extending up from the side of the sound box, a horizontally extending arm slidably connected to the upper end of said post, a center pin assembly vertically and rotatably adjustable in the free end of the slidable arm, said center pin assembly including a tubular shaft, a center pin threaded in such shaft for adjustment therethrough and having a bearing adapted to receive the end of a balance wheel shaft, an adjustable arm on the lower end of the center pin assembly, said arm having depending finger jaws adapted to grip the free end of a watch balance spring, adjustable opposing jaw members mounted on the top of the sound box structure adapted to receive and retain a watch works, adjustable screws on the sides of the box for adjusting said jaw members toward and away from each other, and a cable extending from the transmitter and adapted to be connected to a device for recording the watch beats.

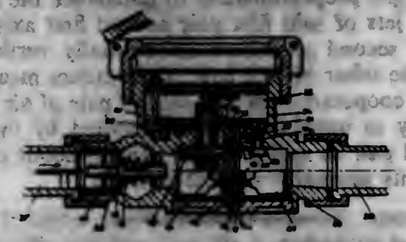


2,772,563
**WATCH BALANCE SPRING TESTING DEVICE AND CRYSTAL MICROPHONE THEREFOR**
George T. Kuwada, New York, N. Y.
Application March 12, 1954, Serial No. 415,780
5 Claims. (Cl. 73—6)

1. In combination, a balance spring testing device having a hollow base, a top supporting plate having an elongated sound box connected to the underside thereof below an elongated opening in said top plate and extending into the hollow base, slide jaw assemblies depending through the elongated opening and into the sound box, adjusting screws for adjusting the assemblies toward and away from one another, said assemblies being adapted to retain and support a watch works, guideway members on the opposite sides of the slide assemblies serving to guide the movement of the slide jaw assemblies, means extending above the base and overlying the jaw assemblies for supporting one end of a balance spring of a watch while the watch is retained between the jaw assemblies, a crystal microphone arrangement comprising a bracket secured to the underside of the elongated sound box and within the hollow base, a pivot arm support journalled upon the bracket, a spring connected between the pivot arm support and the top plate for urging upwardly one end of the pivot arm support, finger means extending upwardly from said pivot arm support through openings in the top plate and the guide way member and adapted to be located in the space between the slide jaw assemblies and to engage with a watch retained there, a crystal member carried by said pivot arm support, terminal brackets secured to said pivot arm support, one of said brackets being insulated therefrom, an electrical resistor and terminal elements extending from the crystal and the resistor to the corresponding terminal bracket and electrically connecting the same in parallel circuit relationship with one another, a wire connected with one of said terminal brackets for directing electric current therethrough.

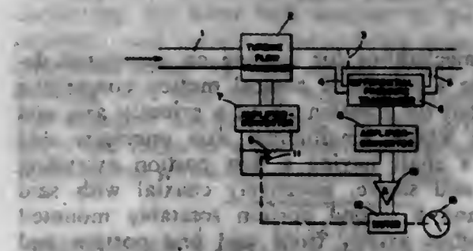
2,772,564
**DETECTION OF LEAKS IN HYDROCARBON STORAGE SYSTEMS**
Patrick F. Dougherty, Chester Heights, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application March 19, 1954, Serial No. 417,433
3 Claims. (Cl. 73—40.5)

1. In the method of storing a hydrocarbon in a subsurface salt cavity having fluid communication with the ground surface through a tubing positioned within the borehole and through the borehole annulus, said borehole annulus providing fluid communication between the ground surface and the upper portion of said cavity and said tubing providing fluid communication between the ground surface and the lower portion of said cavity, in which method the hydrocarbon to be stored is introduced into said cavity through said annulus to thereby displace brine from the system through said tubing, and in which method the stored hydrocarbon is recovered by introducing brine into said cavity through said tubing to thereby displace stored hydrocarbon from the system through said annulus, the method of detecting and locating leaks in said tubing which comprises the steps of: (1) filling said cavity, said annulus and said tubing with brine, (2) introducing a quantity of hydrocarbon into said tubing sufficient to displace a portion of the brine therefrom and from the system through said annulus, (3) discontinuing the introduction of hydrocarbon for a time sufficient to allow hydrocarbon passing from a leak in said tubing to said annulus to rise to the upper end of said annulus, (4) testing for hydrocarbon at the upper end of said annulus, (5) repeating said steps (2), (3) and (4) until at least a portion of said tubing has been tested, whereby the existence and location of a leak in said tubing is determined.



2,772,565
**SMALL BORE ADAPTER FOR SURFACE ROUGHNESS INDICATOR**
Arling Dix Brown, Jr., East Cleveland, Ignacio P. Echegaray and Milton Gross, Cleveland, and Leo F. Valenti, Garfield Heights, Ohio, assignors to Clevite Corporation, Cleveland, Ohio, a corporation of Ohio
Application May 13, 1954, Serial No. 429,644
11 Claims. (Cl. 73—105)

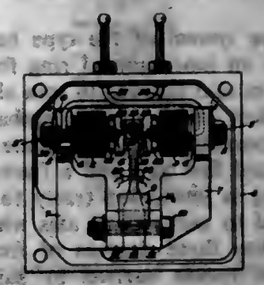
1. An adapter for attachment onto the pickup head of a surface roughness measuring instrument, said adapter comprising a housing having a mounting portion for attachment onto the stylus end of the pickup head of the surface roughness indicator, said housing including elongated tube means of small cross-section extending forward from said mounting portion, a lever of solid cross-section extending lengthwise through said tube means and tapering in either direction away from its pivotal mounting, said lever forward of its pivotal mounting being completely disposed within said tube means, and said tube means being of reduced size at its forward end, a thin stiff wire extending transversely through the lever and fixedly connected thereto midway along the lever, said wire at its opposite ends being snugly received in precisely complementary holes in opposite sides of the tube means which permit the wire to turn therein integral with the lever and thereby provide bearings for pivotal movement of the lever in said tube means, said lever at its forward end carrying a stylus projecting beyond said tube means for engagement with the test surface, and said lever at its opposite end presenting a surface for engagement with the stylus of the pickup head to actuate the pickup head stylus in response to displacement of the lever stylus.



2,772,566
**DEVICE FOR OBTAINING LIQUID TIGHTNESS OF AN ENCLOSED SPACE**
André Farnier, Boulogne-sur-Seine, France
Application April 20, 1951, Serial No. 221,958
Claims priority, application France April 28, 1950
12 Claims. (Cl. 73—229)

4. A liquid meter comprising, in combination, a first container adapted to be filled with oil and including an elongated tubular portion communicating at opposite ends with the interior and exterior of said container, respectively; a counting mechanism located in said first container and including an elongated shaft passing through said tubular portion and being only slightly smaller than the same, said shaft, at that portion thereof which is located in said tubular portion, being spaced at all points from said tubular portion by a distance which is sufficiently small so that the surface tension of the oil at said tubular portion is great enough to prevent the oil from flowing out of said first container through the space about said shaft; a second container located next to said first container and being adapted to have a liquid passing therethrough; a turbine wheel turnably mounted in said second container to be turned by liquid passing therethrough and being operatively connected to said shaft to turn the same; and elongated conduit means passing through a wall portion of said first container and respectively communicating at opposite ends with the interior of said first container and the interior of said second container, said elongated conduit means having, along a substantial portion thereof, a cross section sufficiently small so that the surface tension of the oil at said portion of said conduit means is great enough to prevent oil in said first container from flowing out of the latter through said conduit means, said cross section having its largest dimension greater than said distance between said tubular portion and said shaft.

2,772,567
**MASS FLOWMETER**
Robert H. Boden, Tarzana, and John R. Witherspoon, Canoga Park, Calif., assignors to North American Aviation, Inc.
Application August 21, 1953, Serial No. 375,759
3 Claims. (Cl. 73—231)

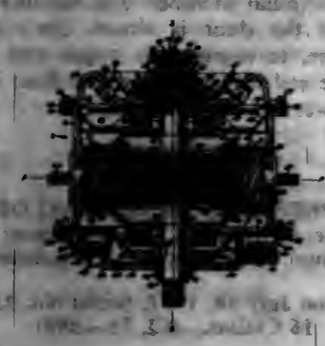


1. Means for measuring the mass flow rate of a fluid in a conduit comprising a venturi section restricting the cross-sectional area of said conduit, a volumetric flowmeter located in said venturi, a differential pressure transducer for measuring the pressure drop across said venturi, and means for dividing the output of said transducer by the output of said meter to yield mass flow rate in said conduit.

2,772,568
**LIQUID FUEL GAUGE FOR AIRCRAFT**
Joseph Sansevino, Hawthorne, Calif.
Application June 7, 1954, Serial No. 434,733
10 Claims. (Cl. 73—322)

1. A gauge for indicating the level of liquid within a tank, comprising: a housing disposed at a side of the tank and having an inlet in fluid communication with the interior thereof; an elongate tube slidable vertically within the housing and projecting thereabove, there being an annular seal between the tube and housing at the upper portion of the latter, there being an annular space between the lower portion of the tube and the lower portion of the housing; valve means for selectively admitting fuel from said inlet into said tube and shutting off said flow, said valve means including a resilient sealing ring disposed within said housing, coaxially beneath the tube and below the level of said inlet, and an inturned annular flange at the lower end of said tube engageable with said sealing ring in response to downward movement of the tube so as to seal said annular space; a bearing at the upper end of said tube; a float slidable in said tube; a graduated rod carried by the float and slidable in said bearing; an annular member fixedly mounted above said tube and through which said rod is upwardly projectible; a door hinged to said annular member; and means on said door operable, when the door is closed down against said annular member, to engage the upper end of said rod and depress the rod so as to retain the float in a position adjacent the lower end of the tube.

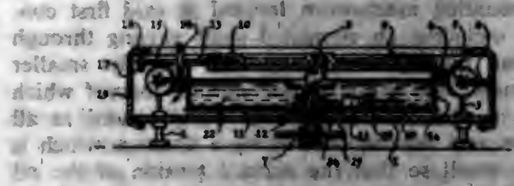
2,772,569
**FLUID PRESSURE MEASURING DEVICE**
Arthur C. Rage, Cambridge, Mass., assignor to Baldwin-Lima-Hamilton Corporation, a corporation of Pennsylvania
Application July 30, 1951, Serial No. 239,216
16 Claims. (Cl. 73—398)



3. Fluid pressure responsive apparatus comprising, in combination, a base, a fluid pressure expansible element having a fixed end supported by said base and the other end free to expand in a given direction in response to an applied fluid pressure, a bending beam having a lengthwise axis which is substantially normal to said direction of expansion of the expansible element and having a surface which undergoes strain as a result of flexing about an axis transverse to said lengthwise axis, one end of said beam being fixed to said base and the other end being free to move so as to flex the beam about the axis transverse to the lengthwise axis, means connecting said free

end of said beam to said free end of the expansible element so as to flex said beam in accordance with expansion of said expansible element, said connecting means including a flexible beam-actuating member extending substantially normal to said beam lengthwise axis whereby the flexible member and beam both flex upon application of pressure to said expansible element, said beam-actuating member having a flexibility substantially larger than that of the expansible element and such that the bellows is substantially relieved of stress transverse to its direction of expansion due to deviation of the free end of the beam from a straight line path during flexing of the beam in response to applied fluid pressure, and strain responsive means secured to the surface of said beam so as to be responsive to the surface strain thereof for determining the extent of flexing thereof as a measure of the fluid pressure applied to the expansible element, said connecting means also including a member engaging said beam and adjustable lengthwise of said beam lengthwise axis and to which the flexible member is connected whereby the moment arm of the beam and expansible element may be varied to adjust the sensitivity of the device, said expansible element being suported by said base through a member having provision for adjusting the position of the expansible element in a direction substantially parallel to said beam lengthwise axis whereby the sensitivity of the device can be further adjusted but to a finer degree than is possible with said other adjustment for a corresponding movement parallel to the beam axis.

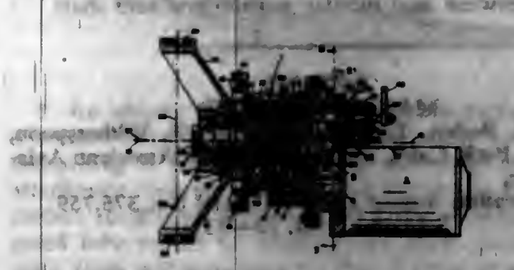
---



2,772,570
**GYROSCOPE**
Albert L. Jackson, Portland, Oreg., assignor to Iron Fireman Manufacturing Company, Portland, Oreg.
Application December 7, 1953, Serial No. 396,433
6 Claims. (Cl. 74—5.43)

1. A gyroscope system of the type having a housing adapted to form an inner gimbal ring for the system, a rotor journalled in said housing to spin about a normally gravity vertical first axis, an outer gimbal ring in which said housing is journalled freely to rotate about a second axis normal to said first axis and a frame in which said outer gimbal ring is journalled freely to rotate about a third axis normal to said second axis whereby the rotor of said system has three degrees of freedom, together with air erection means carried by said housing and adapted continuously to precess said first axis towards its normal gravity vertical position when displaced therefrom, said air erection means comprising means adapted to maintain a supply of air under pressure in said housing, a first pair of air jets, a second pair of air jets, each of said jets being adapted to emit air at the same rate when all of said jets are unrestricted, the jets of said first pair being located diametrically opposite with respect to said first axis with their axis set at equal angles of between twenty and seventy degrees to said first axis in a plane including said first axis and said second axis, the jets of said second pair being located diametrically opposite with respect to said first axis with their axes set at equal angles of between twenty and seventy degrees to said first axis in a plane including said first axis and said third axis, and a pair of pendulum means each independently freely rotatable about said first axis, one of said pair of pendulum means being adapted to cooperate with said first pair of air jets proportionately to unbalance the air emitted by the jets of said first pair as said first axis departs about said second axis from its normally vertical position, and the other of said pair of pendulum means being adapted to cooperate with said second pair of air jets proportionately to unbalance the air emitted by the jets of said second pair as said first axis departs about said third axis from its normally vertical position.

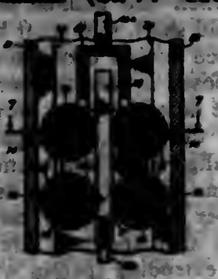
---



2,772,571
**DEVICE FOR TRANSMITTING ROTARY MOTION**
August C. Rigas, Austin, Minn.
Application January 4, 1956, Serial No. 479,751
5 Claims. (Cl. 74—63)

1. A device for transmitting rotary motion comprising a driven vertical shaft having a crank, a wheel rotatable on the crank of said shaft, and an endless track concentric with said shaft comprising a series of vanes projecting radially from gear-connected shafts arranged in an endless shaft-and-gear train, with the successive vanes in progressive relative rotatable position to provide a sectionalized helix; said endless sectionalized helix track being actuated by the eccentric travel of said crank carried wheel.

---



2,772,572
**OSCILLATORY DRIVE MECHANISM**
Albert E. Siler, Compton, and Charles T. Wilcox, Jr., Los Angeles, Calif., assignors to North American Aviation, Inc.
Application September 28, 1953, Serial No. 382,602
10 Claims. (Cl. 74—86)

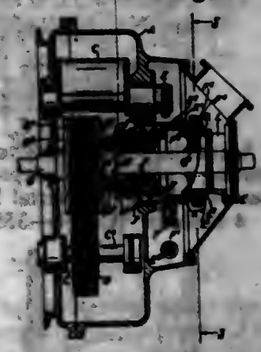
1. A drive mechanism for causing an associated device to describe a selectable conical motion comprising a sleeve mounted for rotation about a primary axis and having a bore whose longitudinal axis intersects said primary axis, a shaft having a first portion extending outwardly of said sleeve, selectively coaxial with said primary axis and a second portion rotatably mounted in said bore offset axially from said first portion and disposed at the same angle to said first portion as said longitudinal axis makes with said primary axis, releasable locking means for preventing relative rotation of said sleeve and said shaft, and driving means for imparting rotation to said sleeve whereby when said sleeve and said first portion are coaxial said first portion is maintained in a neutral position, and when said sleeve and said first portion are noncoaxial a conical motion is imparted to said first portion.

2,772,573
**STROKE MULTIPLIER**
John V. Thomas, Pasadena, Calif.
Application September 5, 1952, Serial No. 307,975
4 Claims. (Cl. 74—110)

1. In a stroke multiplier for a power operated valve assembly, the combination of: a stationary body having parallel axially extending surfaces, a movable cage within the body having a pair of laterally spaced rubber rollers, each of the rollers engaging one of said surfaces, a driven member extending into the body between said rollers and in engagement therewith, means for adjusting the lateral spacing of said surfaces to vary the squeezing pressure on said rollers, whereby movement of the cage acts to cause the rollers to effect greater movement of the driven member in the same direction.

---

2,772,574
**STROKE CHANGING MECHANISM**
John V. Thomas, Pasadena, Calif.
Application December 22, 1952, Serial No. 327,265
1 Claim. (Cl. 74—110)



In a stroke changing device for connecting axially aligned reciprocable driving and driven elements, the combination of: a stationary body having a pair of axially extending stationary parallel gear racks fixed relative thereto, a movable carrier member within the body including a pair of laterally spaced plates, means joining the plates for operation as a unit, two axially spaced pairs of gears rotatably mounted on the carrier member between said plates and meshing with said racks, one of said elements having an end portion extending between said plates, pivot means connecting said end portion to said plates, an axially movable member extending between the plates and provided with parallel gear racks meshing with each of said pairs of gears, releasable means connecting the latter said member to the other of said elements, said carrier member being maintained in axial alignment solely by said axially spaced pairs of gears meshing with said racks, whereby movement of one of the members by the driving element acts to cause the gears and racks to move the other element in the same direction but with a different stroke length.

---

2,772,575
**INFINITELY VARIABLE RATIO TRANSMISSION MECHANISM**
Ronald Albert Gilbert, North Wembley, England, assignor to D. Napier & Son Limited, London, England, a British company
Application April 18, 1955, Serial No. 502,124
Claims priority, application Great Britain April 26, 1954
2 Claims. (Cl. 74—199)

1. An infinitely variable ratio transmission mechanism including in combination a main shaft, a series of transmission discs mounted to slide but not rotate on the main shaft, at least one lay shaft parallel to but displaced laterally from the main shaft, a series of transmission discs on the lay shaft and extending into the space between the discs on the main shaft, the surfaces of the discs on one of the said shafts being of generally frusto-conical form, and engaged by rim portions of the discs on the other of the said shafts, an abutment, resilient means tending to force the transmission discs on the main shaft toward one another, said resilient means comprising a helical spring assembly arranged coaxially with the discs on the main shaft and acting at one end upon such discs and at the other end upon said abutment, said abutment being arranged coaxially

with the spring assembly, control mechanism for moving the main and lay shafts toward and away from one another to vary the effective transmission ratio of the transmission mechanism according to a predetermined law entirely independent of variations in the torque being transmitted, a control ring interconnected with the transmission mechanism and arranged coaxially with and capable of rocking about the axis of the spring assembly, cam means between the control ring and the adjacent spring abutment whereby such rocking movement of the control ring causes axial movement of the spring abutment to control the force exerted by the resilient means on the discs, as such discs move toward and away from one another.

---

2,772,576
**TWO SPEED TRANSMISSION GEAR MECHANISM**
Howard S. Ross, Twin Falls, Idaho
Application January 17, 1955, Serial No. 482,057
13 Claims. (Cl. 74—337)

1. In a gear mechanism of the character described, the combination of: rotary input means; high-speed gearing operatively connected with said input means; low-speed gearing operatively connected with said input means; a first clutch means for operatively connecting said high-speed gearing with said output means, said first clutch means having freedom for a limited range of rotary movement relative to said output means, said clutch means having release positions at the opposite limits respectively of said range to free the output means from said high-speed gearing, said first clutch means having an intermediate position for operatively connecting the high-speed gearing with the output means; and yielding means

to resist movement of said first clutch means from its intermediate position to either of said limit positions thereby to prevent release of the output means from the high-speed gearing when the torque resistance of the output means is below a predetermined magnitude; and a second clutch means for operatively connecting said low-speed gearing with said output means, said second clutch means being an overriding clutch to permit said output means to race ahead of the low-speed gearing when the first clutch is effective.

**2,772,577**
**DREDGE DRIVE**
**Bayard Sharp, Alameda, Calif., assignor to Yuba Manufacturing Company, a corporation**
**Application April 2, 1954, Serial No. 420,697**
**4 Claims. (Cl. 74—399)**

1. A dredge drive comprising an upper tumbler shaft, a pair of bull gears fastened one at each end of said upper tumbler shaft, a pair of pinion shafts, bull pinions fast on said pinion shafts and meshing with said bull gears, a pair of clutch webs fast on each of said pinion shafts, drive gears of large diameter journalled with respect to each of said pinion shafts, drive gears of small diameter journalled with respect to each of said pinion shafts, a relatively long drive shaft subject to substantial twist under load disposed parallel to said pinion shafts, drive pinions fast on said drive shaft near the ends thereof and respectively meshing with said large drive gears and said small drive gears, pneumatic clutches engaging each of said clutch webs and for engaging said large drive gears and said small drive gears, and pneumatic connections for simultaneously engaging said clutches for said large drive gears or for simultaneously engaging said clutches for said small drive gears.

**2,772,578**
**POWER TRANSMISSION WITH DECLUTCHING PROVISION FOR MANUAL OPERATION**
**Nelson G. Kling, Roslyn, N. Y., assignor to Comitech, Ltd., New York, N. Y., a corporation of New York**
**Application June 15, 1953, Serial No. 361,644**
**13 Claims. (Cl. 74—625)**

1. In power transmission apparatus having driven means, a drive shaft operatively associated with said driven means, driving means for actuating said shaft, said driving means comprising a member having at least one aperture, manual means for actuating said shaft independent of said driving means, and means for disconnecting said driving means from operative association with said shaft when said manual means is operatively associated with said shaft, said shaft being apertured and said last mentioned means comprising an axially movable member disposed in said aperture and having a reduced portion, the latter having a movable element operatively associated therewith, said shaft having an aperture adapted to align with said member aperture when said driving means is operatively associated with said shaft, said member being axially movable from a first position in which said apertures are aligned with said movable element extending therein whereby said driving means is operatively associated with said shaft to a second position in which said movable element is retracted from said member aperture and is associated with said reduced portion whereby said driving means is operatively disassociated from said shaft, said manual means comprising a crank having a portion thereof adapted to cooperate with said member when the former is operatively associated with said shaft, said member being automatically movable from said first position to said second position in response to the cooperative association with said member of said crank portion.

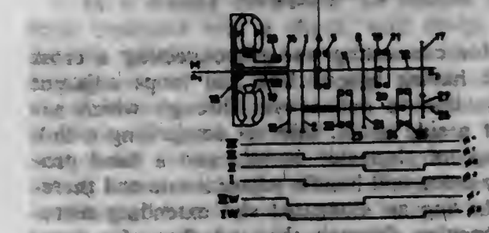
---

**2,772,579**
**CARD DRIVING MECHANISM**
**James O. Jeffery, North Vassalboro, Maine, assignor of one-half to Harvey E. Gogan, Windsor, Maine**
**Application April 9, 1952, Serial No. 281,359**
**5 Claims. (Cl. 74—665)**

1. A card driving mechanism for a carding cylinder having a driven gear comprising a pair of idler gears having axles parallel to the axis of the driven gear, a pair of driving gears having axles alined with each other and perpendicular to the idler gear axles, a drive chain entrained over all of said gears, a power shaft parallel to said driving gear axles, connecting means between said power shaft and said driving gear axles, resilient means in said driving gears for cushioning contact with said drive chain.

---

**2,772,580**
**STEPLESS SPEED-CHANGE MECHANISM**
**Noboru Miura, Toyosaka City, and Hideo Okutani, Arimagun, Japan, assignors of one-half to Nobuki Yamamoto, Toyosaka City, and Seinaburo Ota, Nishinomiya City, Japan**
**Application June 2, 1952, Serial No. 291,132**
**Claims priority, application Japan June 11, 1951**
**2 Claims. (Cl. 74—675)**



1. A torque control type stepless speed change mechanism comprising a driver having a drive shaft fixed thereto, a driven shaft coaxially inserted into the driver, a gear casing in which the drive shaft and driven shaft are journaled, a plurality of pairs of planet gear shafts journaled side by side in said driver, a plurality of pairs of planet gears mounted on said shafts and engaged with each other, a sun gear rotatable with the driven shaft and fixed to the end of said driver shaft within the driven and engaged with the first planet gear of the first pair of said pairs of planet gears, a plurality of sun gears loosely mounted on said driven shaft one connecting each of said pairs of planet gears by engagement with the second planet gear of one pair of planet gears and the first planet gear of the next adjacent pair of planet gears, a further sun gear loosely mounted on said driven shaft engaged with the second planet gear of the last of said pairs of planet gears, a projection fixed to said driven shaft, a differential planet gear rotatably mounted on said projection and geared to said further sun gear by a gear train, a reaction gear rotatably mounted on said driven shaft and engaged with said differential planetary gear, means to rotate said reaction gear to impart a torque to said differential planet gear, the relative sizes of said sun gears, planet gears and differential planet gear being such that a torque applied to said differential planet gear changes the relative speeds of said driven shaft and driver steplessly.

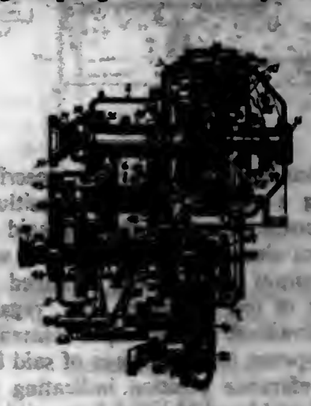
**TRANSMISSION FOR MOTOR VEHICLES**
**Albert Maier, Otto Schwab, and Julius Kiechle, Friedrichshafen am Bodensee, Germany, assignors to Zahnradfabrik Friedrichshafen Aktiengesellschaft, Friedrichshafen am Bodensee, Germany**
**Application February 5, 1952, Serial No. 270,866**
**Claims priority, application Germany February 10, 1951**
**8 Claims. (Cl. 74—732)**



1. In a power transmission, in combination, torque converter means including impeller means and turbine wheel means; drive shaft means driving said impeller means; driven shaft means connected to said turbine wheel means for rotation; releasable clutch means for connecting said drive shaft means with said driven shaft means and being movable between a releasing position in which said torque converter means is operative and said turbine wheel drives said driven shaft means, and a closed position in which said driven shaft means are driven from said drive shaft means; an output shaft; first gear transmission means including a first releasable clutch connecting said driven shaft means with said output shaft; a transmission shaft; second gear transmission means connecting said driven shaft means with said transmission shaft; and a second releasable clutch connecting said transmission shaft means with said output shaft.

---

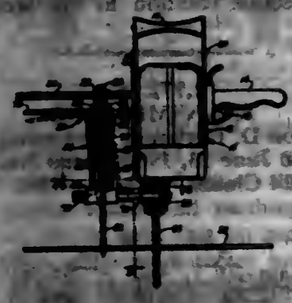
**2,772,582**
**TRANSMISSION**
**Chris Gerst, Detroit, Mich., assignor to The Transmission & Gear Company, Dearborn, Mich., a corporation of Michigan**
**Application April 1, 1954, Serial No. 420,269**
**7 Claims. (Cl. 74—740)**

1. In a power drive transmission comprising a reversing planetary-type gearing and a change speed gearing, an input shaft directly coupled with the planetary-type gearing, a countershaft geared to said planetary-type gearing including driving gears of different sizes rigidly mounted on said countershaft, a primary output shaft arranged parallel to said countershaft including driven gears shiftably and non-rotatably carried by said output shaft to be selectively meshed with the driving gears on said countershaft, a secondary output shaft arranged parallel to said primary output shaft, and clutch-controlled gearing coupling said secondary output shaft with

said primary output shaft, said clutch-controlled gearing including a gear freely rotatably mounted on said primary output shaft and a releasable clutch coupling such gear with the primary output shaft, whereby by selective engagement and disengagement of the releasable clutch said gear may be directly driven by the primary output shaft and impart selective rotation to the secondary output shaft.

---

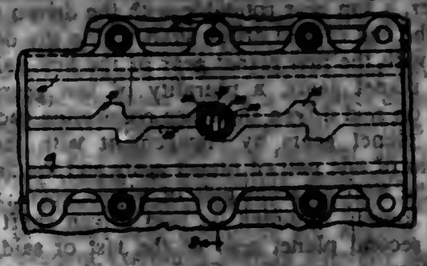
**2,772,583**
**TRANSMISSIONS**
**Watson D. Harbaugh, Evanston, Ill.**
**Application June 13, 1952, Serial No. 293,348**
**24 Claims. (Cl. 74—758)**



1. A transmission comprising a drive shaft, a planetary gear system including a sun gear driven by said shaft, a planet gear and a ring gear, means for applying varying braking loads to the ring gear of said system, a second planetary including a sun gear, a planet gear and a ring gear, the ring gear of the second system being restrained against rotation and the sun gear being freely rotatable with respect to said drive shaft, a live element supporting the planet gears of both of said systems whereby motion of one set of planet gears is transmitted to the other, a third planetary system including a sun gear, a ring gear and planet gears, said planet gears being supported on an element driven by the sun gear of the second planetary system, means for applying varying braking loads on said element, the sun gear of said third planetary system being driven by said drive shaft, and a driven shaft connected to the ring gear of the third planetary system.

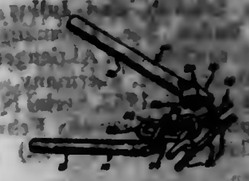
2,772,884
**[illegible] MECHANISM**
[illegible], Md., assignor to [illegible] Company, Inc., [illegible], Md.
Application October 31, 1952, Serial No. 461,760
17 Claims. (Cl. 74—812)

1. In a mechanism of the character described, an input element having a unique reference position and being movable in opposite directions through said reference position, an output element, means coupling said input element to said output element and arranged to drive said output element in one direction only, regardless of the direction of movement of said input element, and means operating in response to the passage of said input element through said reference position indicating the direction of excursion of said input element from said unique reference position thereof.



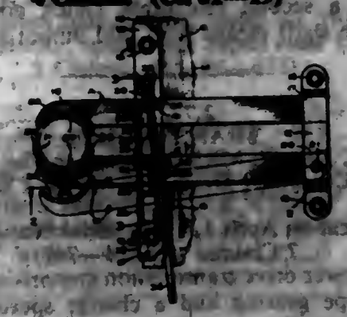
2,772,585
**POWER DRILL ATTACHMENT**
Donald C. Sadler, Wabasso, Minn.
Application April 30, 1954, Serial No. 426,652
6 Claims. (Cl. 77—16)

1. An attachment for a power drill having a steadying handle, comprising a U-shaped bracket dependingly carried by the steadying handle in spaced relation to the drill, a rotatable screw shaft carried by the bracket disposed between the legs thereof, means carried by said shaft at its lower end and operatively connected to the chuck of said drill to impart rotation to said shaft, an arm pivotally carried intermediate its ends upon said shaft and disposed normally thereto for movement longitudinally thereof, said arm extending outwardly from either side of said bracket between said legs, and means carried by said arm for attachment about a workpiece to be drilled, rotation of said shaft upon operation of the drill causing said arm to move in a direction away from said workpiece to feed said drill into the workpiece.



2,772,686
**INDEXING MECHANISM**
Charles H. Jones, Jr., Leominster, Mass., assignor to Gratti Engineering and Sales Co., Inc., Leominster, Mass., a corporation of Massachusetts
Application March 24, 1954, Serial No. 418,398
6 Claims. (Cl. 77—64)

1. Indexing mechanism comprising a first and a second element, said elements being adjacent and relatively movable in a predetermined path, a rotatable member located in said second element adjacent said first element, a spring urging said rotatable member to turn, a track in said first element, said rotatable member having a raised portion slidably engaging said track, said track having a widened portion inwardly facing diametrically transversely on opposite sides of said track and which are offset from each other longitudinally with respect to the track, and further including a clearance allowing said rotatable member to turn within limits when the raised portion enters

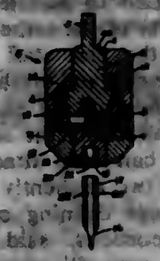


said widened track portion during relative movement of said elements, said faces engaging said raised portion against the force of said spring when the rotatable member is in said turned position thereby passing said rotatable member to resist further relative movement of said elements.

2,772,587
**TOOL SET FOR OPENING AND CLOSING CHAIN LINKS**
Emory R. Woodring and Albert P. Woodring, Oreside Manor, Pa.
Application May 6, 1955, Serial No. 506,426
1 Claim. (Cl. 81—15)

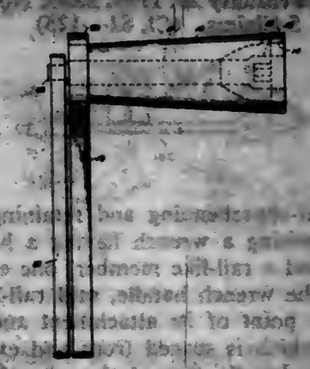
A tool set for connecting and disconnecting a cross chain end link having spaced legs and loops adjacent one end of the link to define eyes through which extends a link of a side chain, said set comprising a link holder including an elongated handle and a head projecting laterally from said handle adjacent one end thereof, said head having an elongated slot extending therethrough and opening through the end thereof remote from said handle, said slot being adapted to receive the legs of the cross chain end link to hold the link against rotation; and a link loop bender including an elongated handle, a flat head carried by said handle and extending longitudinally outwardly therefrom adjacent one end thereof, said tool head having a loop receiving slot opening through one side thereof to define spaced loop engaging side walls to receive a loop therebetween and bend the loop to open or close the loop about a side chain link.

2,772,589
**VISE FOR SUPPORTING PIPE DURING CAULKING**
John H. Jones and Carlos B. Bowen, Carmichael, Calif.
Application September 26, 1955, Serial No. 536,427
4 Claims. (Cl. 81—19)



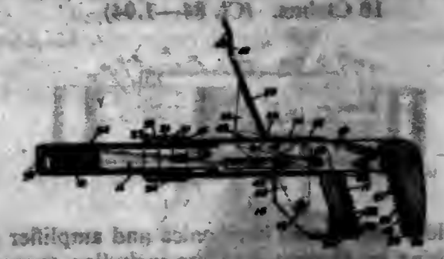
1. In a vise for supporting a pipe during caulking: a base member fastened to an edge portion of a work

bench; an anchor bar fastened to the bench inwardly from said edge portion; a fixed jaw having an inner end secured to the anchor bar, an intermediate portion secured to the base member, and an outer end projecting beyond said edge portion of the bench; a movable jaw having an inner end pivotally attached to the anchor bar, an intermediate portion slidably guided by the base member, and an outer end projecting beyond said edge portion of the bench; the projecting ends of the jaws having coacting saddles thereon, which have gripping surfaces disposed in confronting relation with one another so as to be positioned on opposite sides of a vertically-arranged sewer pipe interposed between the saddles; and means operable for swinging the movable jaw towards the fixed jaw to grip and support such a pipe therebetween.



2,772,599
**POWER HAND TOOL ATTACHMENT**
Howard F. Brumbelow, Bethel, Pa., assignor to Drilo Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application February 15, 1955, Serial No. 488,320
3 Claims. (Cl. 81—52.4)

1. In a driving device for an electric drill having a rotor equipped with a chuck, said device comprising a driving spindle having a portion at its upper end for engagement by the jaws of said chuck and a frictional clutch element at its lower end, a driven spindle having a frictional clutch element at its upper end to receive said clutch element of the driving spindle, means for securing a tool to the lower end of the driven spindle, and a "floating" housing adapted to be held stationary in the hand of the user while enclosing said clutch elements and providing a bearing for a journal portion on each of said rotary spindles, both the chuck-receiving and tool-securing ends of said spindles being severally accessible at the top and bottom of said handle without danger to the fingers of the user during the rotation of the spindles; the invention herein described wherein said driven spindle is enclosed substantially entirely within said stationary handle and includes a bore of hexagonal cross section to provide said tool-securing means, said tool having a shank of complementary cross section for an engagement with said bore, and a detent for releasably securing said tool in assembly with said journal portion of the driven spindle within said handle, with the effect that the body of the tool is substantially the only rotating element exposed below the bottom of the stationary handle.

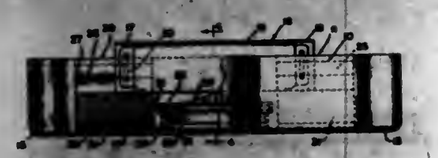


2,772,990
**BOLT HOLDING DUAL SOCKET WRENCH**
John William Wendle, Salina, Kans.
Application July 22, 1955, Serial No. 523,661
1 Claim. (Cl. 81—65)

A wrench structure for dual wheels having inside and outside nuts, comprising a shell having a wrench end for engaging the outside nut and a supplemental wrench for engaging the inside nut, manual means for holding the shell and manual means for actuating the supplemental inside nut wrench, said supplemental wrench consisting of an elongated shaft disposed through the shell and provided with an inside nut engaging socket head, the other end of the shaft being provided with a laterally disposed handle, said last mentioned end of the shaft being provided with a polygonal shaped portion, said

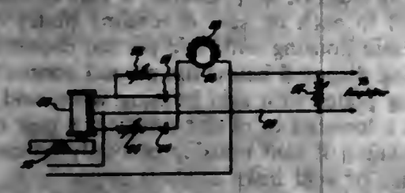
handle being formed with a polygonal shaped opening for detachably receiving the polygonal shaped portion of the shaft.

2,772,591
**TOGGLE-CONTROLLED, SLIDABLE OUTER JAW WRENCH**
Lester W. Munroe, Cascade, Mont.
Application January 21, 1955, Serial No. 483,243
3 Claims. (Cl. 81—98)



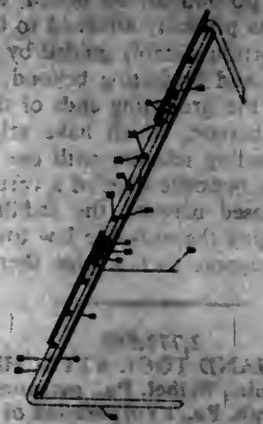
1. A power lock wrench comprising an elongated bar having a first jaw, a housing slidably receiving said elongated bar slidably therethrough, a second jaw carried by said housing, adjustment means for drawing said first and second jaws together, and power lock means mounted on said housing for forcing said first and second jaws together, said adjustment means comprising a reduced externally threaded extension at the end of said bar remote from said first jaw, an internally threaded sleeve screwed onto said extension, and coupling means connecting rotatably the end of said sleeve with the end of said housing adapted to prevent longitudinal displacement therebetween while permitting rotational movement of said sleeve relative to said housing, said power lock means comprising a flat lever having depending plates straddling said housing intermediate said coupling means and said first jaw, said depending plates being pivotally connected to opposite sides of said housing, a pair of links pivotally connected to each of said depending plates on opposite sides of said housing with said pivotal connection of said links being disposed below the pivotal connection of said depending plates with said housing when said lever plate bar is in a lowered or closed position, a pair of plates on opposite sides of said housing pivotally connected to the other ends of said links at their upper ends, said plates intermediate their ends being pivotally connected to a pin piercing said housing, said bar having an elongated slot adapted to receive said pin therealong, said housing at the end thereof adjacent said first jaw having depending plates receiving said second jaw therebetween, a pin fixedly carried by said second jaw and extending outwardly through said depending housing plates, said housing depending plates having elongated downwardly inclined slot receiving said jaw pin therethrough, said plates at their lower ends being pivotally connected to said jaw pin.

2,772,592
**NUT RETAINER FOR WRENCHES**
William W. Garber and John W. Garber, Richmond, Va.
Application February 29, 1956, Serial No. 568,506
5 Claims. (Cl. 81—125)



2. A multinut-apprehending and retaining device for wrenches, comprising a wrench having a handle and a wrench head, and a rail-like member, one end of which is attached to the wrench handle, said rail-like member rising from the point of its attachment and forming a linear portion which is spaced from and extends longitudinally of the handle toward the wrench head, said linear portion flowing into an inverted hook-shaped portion which descends substantially perpendicularly to the diameter of said wrench head and terminates at the top center of the opening of said wrench head.

2,772,593
**HARMONICA APPARATUS**
Edward A. Zielinski, Berwyn, Ill., assignor of one-half to Joseph S. Kishel, Brookfield, Ill.
Application May 11, 1953, Serial No. 353,978
10 Claims. (Cl. 84—1.04)



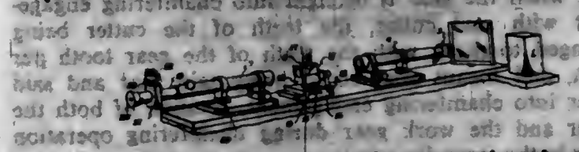
1. A holder unit for an harmonica and amplifier therefor comprising an elongated casing including spaced side walls, end walls, and a bottom wall, and the said casing having an open throat for the reception of an harmonica removably mounted therein, spaced retaining means in the said holder casing for removably retaining an harmonica therein, and means arranged within the said holder casing between the said spaced retaining means for mounting an amplifier microphone pickup within the said holder casing and between the bottom wall of the said holder casing and an harmonica mounted therein.

2,772,594
**APPARATUS FOR PRODUCING CHIME TONES**
Paul Henry Rowe, Los Angeles, Calif., assignor to Manu-Rowe Electronsonic Corporation, Los Angeles, Calif., a corporation of California
Application March 28, 1952, Serial No. 279,352
2 Claims. (Cl. 84—1.11)

1. In an electrical musical instrument: a plurality of parallel circuits, each including in series, means for producing sonic impulses, a saturable reactor energized by said means for adding harmonics to said impulses; a parallel connected rectifier and first variable impedance means, and a second variable impedance means; a common impedance in series with all of the parallel circuits; and means cooperating with said common impedance for translating said impulses to sound.

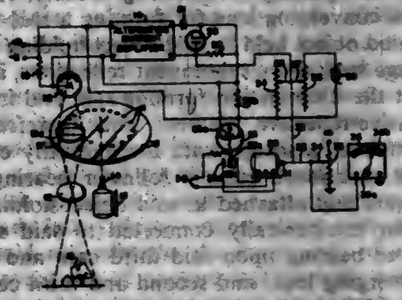
2,772,595
**GAME FOR TEACHING WRITTEN MUSIC**
Leotis E. Cuffle, Akron, Ohio
Application May 21, 1953, Serial No. 356,341
3 Claims. (Cl. 84—472)

1. A device of the character described for teaching written music, comprising a frame, a plurality of laterally extending bars supported in parallelism on said frame, said bars being in series of the same transversely equally spaced to represent the clef staff lines and separate elements representing notes and symbols of written music, attaching means on the back of each said element for selectively releasably attaching the same in various positions on the staff line bars, said attaching means of each said element including two resiliently mounted, outwardly oppositely arcuate tangs defining outwardly oppositely presented undercut portions, said outwardly arcuate tangs being yieldingly inwardly engageable between two adjacent staff line bars yieldingly to retain the same behind said undercut portions for centering the element between said two adjacent staff line bars, and two inwardly arcuate tangs resiliently mounted intermediate said outwardly opposite arcuate tangs and defining outwardly oppositely presented undercut portions adapted similarly to receive and yieldingly retain a single staff line bar behind the same for centering the element over the last-named line bar.



2,772,596
**COMBINATION PAIR OF ADJUSTABLE SHIMS FOR AUTOMOBILE CAMBER AND CASTER CONTROL**
Roger B. Trussell, Richmond, Va.
Application December 7, 1954, Serial No. 473,533
3 Claims. (Cl. 85—50)

1. A pair of cooperating wedge-shaped elongated shim members of general rectangular shape, one of said shims being shorter and termed the fixed shim, said fixed shim having an elongated slot formed therein extending from its thicker end into the shim in the longitudinal direction and along the longitudinal axis to a position just beyond half the length of the shim, said slot being so positioned that it is received over an anchor bolt adapted to extend transversely through the shim so that about half the length of the shim lies each side of the anchor bolt and said fixed shim having guide elements extending along each side of the shim at the thinner end thereof, said other shim being an adjustably positioned shim with respect to the fixed shim and having an elongated slot extending therein from the thinner end along the longitudinal axis thereof for approximately the full length of the shim so as to also be received over the anchor bolt, said adjustably positioned shim being of a width to be easily receivable and guided between the guide members of the fixed shim, said elongated slots being in alignment when the adjustable shim is slid into position along the face of said fixed shim, at least one of said abutting faces of the cooperating shims being roughened so as to provide increased frictional resistance to one shim sliding over the other shim, said guide members on the fixed position shim being of such height that they do not extend above the surface of the adjustably positioned shim in an operative position and whereby movement of said adjustably positioned shim against said fixed position shim in a position where the thicker end of one shim is positioned proximal to the thinner end of the other shim so as to vary the combined thickness provided by the two wedge-shaped shims.

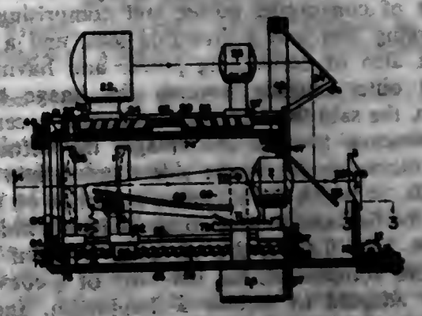


2,772,597
**PRECISION REFRACTOMETER**
Oscar H. Gruner, Kensington, Md., assignor to the United States of America as represented by the Secretary of Commerce
Application February 6, 1953, Serial No. 335,611
3 Claims. (Cl. 88—14)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A precision refractometer for measuring the index of refraction of a specimen to an accuracy within one digit in the fifth decimal place, comprising a monochromatic source of light, a collimator located in the path of the beam of light from said source to render the rays of said beam parallel, an image producing filament located at the focal plane of said collimator, a prism set having an opening for holding said specimen positioned in the path of said parallel rays of light, the faces of said prism set being only approximately parallel and approximately perpendicular to the beam of light, said prism set having an index of refraction which corresponds to the index of refraction of the specimen to within two digits in the second decimal place, a contact liquid forming a film between said prism set and said specimen, said contact liquid having an index of refraction which corresponds to the index of refraction of said specimen to within 3 digits in the third decimal place, a micrometer telescope having filar index means defining a fiducial reference datum in the focal place of said telescope positioned in the path of said light beam, a first portion of said light beam passing substantially undeviated through the body of said prism set only, a second portion of said light beam passing through said prism set and said specimen whereby each of said beam portions projects an undeviated and deviated optical image of said filament respectively on the focal plane of said telescope adjacent said filar index means, and means for measuring the deviation between said undeviated and deviated images with respect to said filar means.

2,772,598
**MINIMUM LUMINANCE RESPONSIVE SYSTEM**
William Hodge, Bayville, N. Y., assignor to Fairchild Camera and Instrument Corporation, a corporation of Delaware
Application September 20, 1954, Serial No. 459,140
9 Claims. (Cl. 88—23)

1. A system responsive to the minimum luminance of a scene comprising: a scanning device for sequentially blocking out elemental areas of the scene; means for developing an electrical signal varying with the total luminance of the unblocked area of the scene under examination by said scanning device; and an electrical

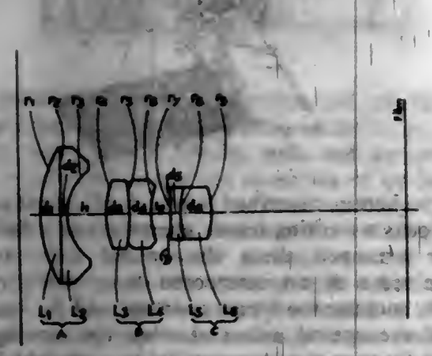


detector responsive to said signal for detecting the peak value thereof over a scanning period, said peak value of said signal being representative of the minimum scene luminance.

2,772,599
**METHOD OF SETTING THE ELEMENTS OF AN OPTICAL SYSTEM AND PROJECTOR AND COPYING CAMERA FOR PERFORMING THE SAME**
Allan Brome, New York, N. Y.
Application June 3, 1950, Serial No. 165,937
8 Claims. (Cl. 88—24)

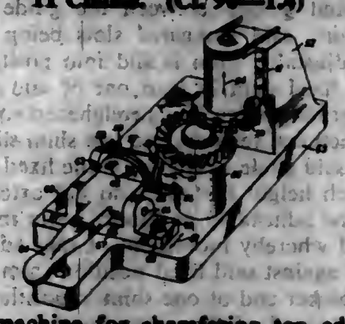
1. The herein described method of adjusting to conjugate focus a limiting frame aperture and a field locating member arranged along the optical axis and at the opposite sides of an interposed lens which comprises: relatively moving the frame aperture and the lens rectilinearly of the optical axis and relatively moving the lens and field locating member parallel to a straight line drawn from the principal focal point of the lens on the field side thereof to a point in the periphery of the field image of the aperture as projected through the lens when the planes of said field and aperture are in conjugate focus.

2,772,600
**IMAGE SUPERIMPOSITION APPARATUS**
Joseph B. Walker, Los Angeles, Calif.
Application August 3, 1953, Serial No. 371,881
2 Claims. (Cl. 88—24)



1. In a coupled duplex optical system for superimposing images, a first group of spaced and aligned elements comprising a diverging primary lens, a converging sec-

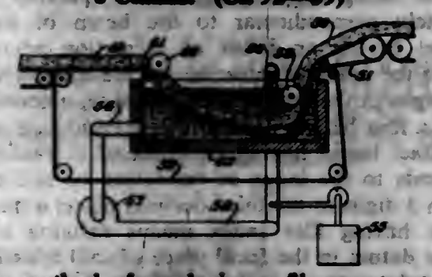
ondary lens, a transmissive-reflective element and an image surface, a cam for causing motion of said lenses approximately proportionally related to a stationary point between them; a second group of spaced and aligned elements comprising illuminating means, object-holding means, a converging lens for forming a real image of an illuminated object held in said object-holding means upon said image surface by subsequent reflections, and a mirror to direct the illumination forming said real image to said transmissive-reflective element and therefrom to said image surface, a second cam mechanically connected to said first mentioned cam, a follower bearing upon said second cam and attached to said object-holding means, a third cam mechanically connected to said second cam, a follower bearing upon said third cam and attached to said converging lens, said second and third cams defining motions of followers bearing thereupon approximately proportionally related to a stationary point between them, the relation between motions simultaneously imparted by said three cams being such that an image formed upon said image surface by said first group of elements in focus and an image formed upon said surface by said second group of elements in focus remain in focus upon said surface throughout changes in magnification of each said image occasioned by the stated motions of said elements.



---

2,772,601
**WIDE ANGLE PHOTOGRAPHIC OBJECTIVE COMPRISING THREE AIR SPACED COMPONENTS**
Ludwig Jakob Bertele, St. Gall, Switzerland
Application June 13, 1955, Serial No. 515,151
Claims priority, application Switzerland June 18, 1954
8 Claims. (Cl. 88—57)

1. A wide-angle objective consisting of three components, separated by air spaces, namely a first component reckoned from the object side of diverging power and meniscus form convex towards the object and having a focal length within the range of $-0.95\ f$ to $-3.00\ f$, where $f$ is the focal length of the complete objective, the said component comprising at least a converging lens and a diverging lens having the lens curved surfaces of each facing towards each other, a second component of converging power and comprising at least a converging lens and a diverging lens, and a third component also of converging power and having its more curved outer surface towards the image and convex thereto, the said third component having a cemented surface concave towards the image, the refractive index being higher on the image side thereof than on the object side, in which the air-space reckoned on the axis between the first and second components is within the range of $0.06\ f$ to $0.40\ f$, the air-space between the second and third components has the form of a converging lens and is adapted to receive a diaphragm, and the axial separation between the outer surfaces of the second and third components remote from the diaphragm space lies within the range of $0.25\ f$ and $1.4\ f$.



2,772,602
**APPARATUS FOR MANUFACTURING SPIRAL BEVEL AND HYPOID GEARS**
John M. Christman, Grosse Pointe Woods, Mich.
Application March 30, 1951, Serial No. 218,488
11 Claims. (Cl. 90—1.4)

10. In a machine for chamfering top edges of teeth on spiral bevel and hypoid gears, a spindle adapted to receive for rotation a gear to be chamfered, a rotatable cutter having a plurality of chamfering teeth provided thereon, each of said teeth having flat sides and two cutting lips adapted to chamfer simultaneously two gear tooth edges, said cutter being rotatably mounted in said machine to have its axis extending generally perpendicular to the cone surface of the gear, but angularly offset therefrom for an angle to have the plane of cutter rotation coinciding in part with the surface of the gear cone when the gear is brought into chamfering engagement with said cutter, the teeth of the cutter being arranged to mesh with the teeth of the gear tooth per tooth, and means adapted to bring said gear and said cutter into chamfering engagement, rotation of both the cutter and the work gear during chamfering operation being in the same direction.

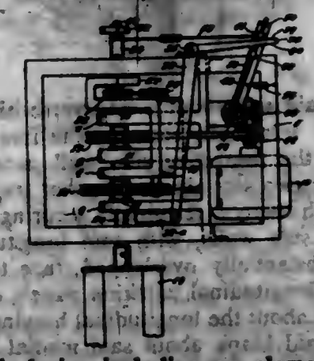
---

2,772,603
**FIBROUS STRUCTURES AND METHODS FOR MANUFACTURING SAME**
Jack H. Waggoner, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Application September 12, 1950, Serial No. 184,355
5 Claims. (Cl. 92—39)

1. The method of producing a fibrous structure comprising forming a layer of glass fibers, subjecting a slurry of cellulose pulp fibers to reaction with a solvation compound contained in solution in the slurry, continuing the solvation of the cellulose until the surfaces of the pulp fibers are partially gelatinized, working the slurry of partially gelatinized pulp fibers through the layer of glass fibers substantially completely to impregnate the layer of glass fibers, and then drying the fibrous mass.

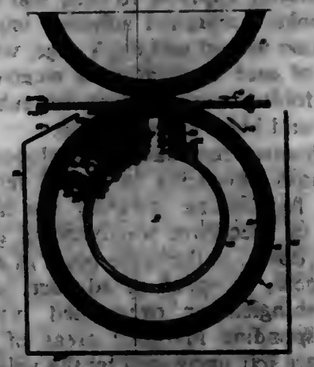
---

2,772,604
**METHOD OF COATING PAPER WITH HIGH SOLIDS CONTENT COATING MATERIAL**
Gerald D. Maughton, Appleton, Wis., assignor to Combined Locks Paper Co., Combined Locks, Wis., a corporation of Delaware
Application June 3, 1953, Serial No. 359,992
1 Claim. (Cl. 92—40)



The method of treating paper consisting of passing a web of paper while between 80 percent to 86 percent water content and supported on a felt, between two rolls, the roll in direct contact with the paper having a smooth web contacting surface, applying by a smooth surfaced applicator roll in contact with the roll directly engaging said web a film of paper-coating material having a solids content of between 35 percent to 50 percent to said last-mentioned roll and transferring said film as deposited on said roll to said web.

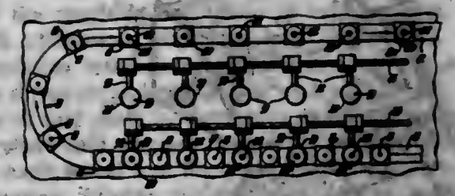
---



2,772,605
**CONTROL DEVICE**
Henry A. Schlegel, Riverton, Conn.
Application January 27, 1955, Serial No. 484,538
5 Claims. (Cl. 92—46)

1. A control device including an element insertable into a material, a drive shaft connected to said member, a gear on said drive shaft, power transmitting means including a countershaft, a motor for driving said countershaft, a member rotatable about the axis of said countershaft, a second countershaft carried by said member and driven by the first countershaft, a drive pinion on said second countershaft in mesh with the said driving gear, means on said supporting member adapted to be rotated about its axis by the rotating force applied to the gear by the said pinion, a spring member for resisting the rotation of said supporting means, a mechanism for operating a valve, and means actuated by the rotation of said supporting member to actuate the said mechanism and cause operation of the valve in accordance with the amount of movement of said supporting member.

---

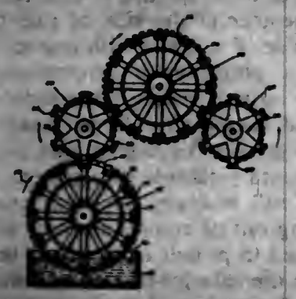


2,772,606
**COMBINATION SUCTION ROLL AND SILENCING AND CLEANING MEANS**
Joseph J. Kelly, Georgetown, S. C.
Application July 29, 1953, Serial No. 525,191
4 Claims. (Cl. 92—83)

1. In combination, an elongated rotatably mounted hollow suction roll, a plurality of perforations in the wall of said roll, a vacuum chamber comprising an elongated tubular member disposed within said roll and spaced from the inner surface thereof, a longitudinally extending slot in said member, packing means slidably mounted on said member on opposite sides of said slot, fluid pressure means for holding said packing means in yieldable engagement with the inner surface of said roll, an elongated boss on said member at the side of said packing means on the trailing side of said slot with respect to the rotation of said roll, a plurality of circumferentially spaced grooves in said boss, a sealing plate slidably mounted in each groove and having an enlarged head, fluid pressure means in each groove for urging said plates outwardly and said heads into yieldable engagement with the inner surface of said roll whereby the inenr ends of said perforations moving out of communication with said chamber will be closed to permit entry of air to such perforations only from the exterior of said roll thereby reducing noise resulting from air rushing in to fill the evacuated perforations, a channel in said boss, an elongated spray head in said channel for directing cleaning fluid into said perforations, a sealing strip slidably mounted on said boss at the trailing side of said channel and air pressure means for urging said sealing strip into yieldable engagement with the inner surface of said roll.

---

2,772,607
**APPARATUS FOR MAKING FILTERS**
Russell S. Thatcher, Camden, Tex., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application July 19, 1954, Serial No. 444,034
4 Claims. (Cl. 92—54)



1. Apparatus for forming stacks of accreted plaques comprising a conveyor, a series of vertical mandrels arranged along and in spaced relation on said conveyor, a series of containers arranged along and to one side of said conveyor, a series of suction cups each pivotally mounted alternately to register with one of said containers and a space intermediate adjacent mandrels in timed sequence with movement of said conveyor, pneumatic operative means associated with said conveyor for alternately removing accreted plaques from said cups and depositing them on said mandrels, and means connected with said suction cups for applying suction to the latter when positioned over said containers.

---

2,772,608
**REDUCTION OF EDGE FLASHING ON MOLDED PULP ARTICLES**
Richard L. Emery, Waterville, Maine, assignor to Keyes Fibre Company, Portland, Maine, a corporation of Maine
Application November 19, 1951, Serial No. 257,117
4 Claims. (Cl. 92—56)

1. A pulp fiber molding apparatus comprising a movable forming die, said forming die being movable into and out of a fiber pulp slurry bath wherein a mass of fibrous pulp is deposited on said forming die, said forming die being movable into a compacting station, a movable compacting die at said compacting station, said compacting die being constructed and arranged to contact said forming die and to compact the mass of fibrous pulp on said forming die, said forming die and said compacting die having complementary die faces, a movable

pressing die at a second station, transfer means arranged to move said mass of fibrous pulp, after being compacted, toward the pressing die at said second station, said pressing die having a peripheral portion radially outward of its die face which is substantially complementary to the corresponding peripheral portion of said compacting

die, the peripheral portion of said pressing die being constructed and arranged to snugly embrace the corresponding peripheral portion of said compacted mass, when said pressing die and said mass are in operative position, to press any upstanding portions of said mass back into the body thereof.

2,772,609

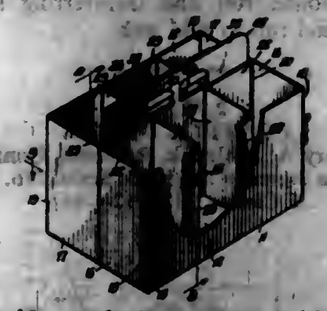
## BOX MACHINE

Herschel Vlotor Bray and Walwin J. Reschè, Jr., Highland, Ill., assignors to Highland Box Company, Highland, Ill., a corporation of Delaware

Application September 30, 1953, Serial No. 383,362
1 Claim. (Cl. 93—36)

Apparatus for forming a cleat-reinforced container from a paperboard tube, comprising an elongate anvil of angualr cross section, said anvil having a forming recess extending subtantially the entire length of its vertex, clamping means movable toward and away from said anvil to secure portions of the tube adjacent a corner fold, a longitudinal forming element reciprocally mounted opposite the vertex of said anvil for movement into and from said forming recess, said forming element being of a length substantially less than that of said recess to deform a previously-severed corner portion of the tube inwardly as a re-entrant cleat-receiving pocket, and means for moving said clamping means toward the anvil prior to advance of the forming element and to move said clamp means clear of the anvil after retraction of said forming element, thereby permitting lengthwise insertion of a reinforcing cleat while the tube is secured with the forming element clear of said pocket and permitting the tube to be cleared from the machine after insertion of said cleat.

---



2,772,610

## METHOD OF MAKING ARTICLE CARRIER

Edwin L. Arneson, Morris, Ill., assignor, by mesne assignments, to Federal Paper Board Company, Inc., Bogota, N. J., a corporation of New York

Application August 22, 1952, Serial No. 305,776
4 Claims. (Cl. 93—49)

1. A method of forming an article carrier from a one-piece paperboard blank characterized by a rectangular bottom panel, side wall panels integrally hinged by longitudinal creases to opposite side margins of said bottom panel, four sets of end wall and partition forming panels having the panels of each set integrally connected by transverse hinging creases to one another and to an end margin of one of said side walls, and a longitudinal partition panel lying between each of a pair of said sets at either end of said respective side wall panels, each of said longitudinal partition panels being integrally connected by a longitudinal hinging crease to a panel of one set of each pair and being separated by a cut from the other set of the pair; said method comprising the steps of folding

all four of said sets about a transverse hinging crease of each thereof, terminally securing the free end of two of said sets to the respective side wall panels, again folding the other two sets about a farther transverse hinging crease of each thereof, terminally securing the last named sets to said side walls, with said longitudinal partition panels in substantially overlapped, face to face contact, folding said longitudinal partition panels unidirectionally and as a unit about the longitudinal hinging creases thereof, folding said blank about said medial bottom crease, and securing the longitudinal partition panels in face to face relation to one another and to corresponding panels of said four folded sets.

2,772,611

## ENVELOPE MAKING METHOD AND MECHANISM

Vincent E. Heywood, Worcester, Mass., assignor to United States Envelope Company, Springfield, Mass., a corporation of Maine

Application June 16, 1951, Serial No. 231,950
49 Claims. (Cl. 93—62)

1. In envelope making mechanism, means for folding over the side flaps of successive substantially rhombic blanks advancing flatwise in spaced relation, means for overtaking each so-folded blank by the next-following so-folded blank but only to an extent such that lower edges of the folded-over side flaps of the one are slightly overlapped by the seal flap edge of the other, and means for thereafter separately applying to each seal flap of the so-overlapper blanks a marginal adhesive imprint, in overgumming relation to said seal flap's edge, whereby the excess adhesive of each application is received on the adjacent blank's folded-over side flaps, for subsequent sticking thereto of said blank's bottom flap.

41. In mechanism for making envelopes from a succession of blanks advancing in spaced relation at high speed, means for folding inwardly the lateral pocket-forming flaps of successive so-advancing blanks, means for so slowing down, at the same point in each so-folded blank's movement, its speed of advance, as to create a slow-moving shingled or overlapped blank assembly wherein corresponding marginal areas of each blank's infolded flaps are left uncovered by the adjacent blank of said assembly, means for imprinting with adhesive the successive so-uncovered areas of said slow-moving blank

assembly, means operative on each blank, after such application thereto of adhesive, to restore its high speed advancement and its spaced relation to the next-following blank, and means operative on each blank during its restored high speed advancement for folding inwardly its lower pocket-forming flap into adhesive-seam connection with the imprinted marginal areas of said previously-folded lateral pocket-forming flaps.

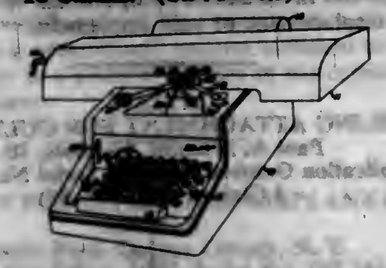
2,772,612

## SHEET PILING MECHANISMS

Daniel E. Folck, Duquesne, and William G. Gibbs and Roy E. Howell, Pittsburgh, Pa., assignors to United States Steel Corporation, a corporation of New Jersey

Application March 12, 1954, Serial No. 415,768
12 Claims. (Cl. 93—93)

3. In a sheet processing line which includes a conveyor system, a gate for passing prime sheets and diverting defective sheets, and a counter for registering the number of prime sheets passing said deflector, the combination therewith of a piler for the prime sheets comprising means located at the exit end of said conveyor system for supporting a pallet in position to receive sheets from said conveyor system with the sheets forming a pack of a definite number on the pallet, a circuit connected to said counter for stopping feeding of sheets to said conveyor system after a predetermined number of prime sheets several short of a full pack has been counted, the sheets on the conveyor system ahead of the counter tending to supply the difference to the pack, means controlled by said counter for removing the pallet and sheet pack from said supporting means after a predetermined larger number of prime sheets equal to a full pack has been counted, and means for resuming feeding of sheets to said conveyor system when another pallet is positioned to receive them.



---

2,772,613

## PHOTOCOMPOSING APPARATUS AND JUSTIFYING APPARATUS

Woodbury Williams, Rockville Centre, N. Y.

Application March 18, 1955, Serial No. 495,115
18 Claims. (Cl. 95—4.5)

1. A photocomposing apparatus comprising a frame, a carriage slidably mounted on said frame, a photographic film magazine on said carriage, means for intermittently feeding film from said magazine, a lightproof housing enclosing film fed from said magazine, said housing having an aperture to admit light rays to a limited area of said film to expose the same, a shutter for momentarily opening and closing said aperture, a light source providing a light beam focused on said aperture, a plurality of type bars pivotally mounted on said frame, a type face on each type bar, a transparent character outline mounted on each type bar, a plurality of finger engaging keys providing a keyboard for actuating said type bars to move said character outline into alignment with said aperture and light beam, shutter operating mechanism operable by said type bars to actuate said shutter and expose said film to provide an image of said character thereon, a paper tape, means for feeding said tape in juxtaposition to said type bars in operative position whereby each type face prints a character on said tape, a shift key and a space bar on said keyboard, a rack bar on said carrige, mechanism for controlling step by step forward movements of said carriage in accordance with the widths of characters to be printed and the spaces between words, said mechanism comprising a base slidably mounted on said frame for movement parallel to the movement of said carriage, a shaft rotatably mounted on said base, a pinion fixed to said shaft and meshing with said rack bar, a keyway in said shaft, a first character ratchet wheel fixed to said shaft adjacent one end, a plurality of additional character ratchet wheels rotatably mounted on said shaft, a last character ratchet wheel rotatably mounted on said shaft adjacent the opposite end, the teeth on each wheel having a pitch different from the teeth on other wheels, the pitch of the teeth on each wheel corresponding to the width of a character or group of characters on said type bars, an escapement mechanism carried by each additional wheel and cooperating with the teeth on the next preceding wheel to control step by step rotation of all preceding wheels and said shaft to advance said carriage step by step in accordance with the pitch of the teeth on said next preceding wheel, a last escapement mounted on said frame and cooperating with said last wheel to control the step by step rotation of all of said wheels and said shaft and the resulting movement of said carriage, a pawl on each additional wheel and said last wheel, said pawls permitting rotation of said wheels relative to said shaft in one direction and engageable with said keyway upon rotation of said shaft by the return movement of said carriage to return said wheels to starting position, a ring surrounding each wheel and fixed against rotation, an escapement actuating thimble slidably mounted in each ring, cam means for moving each thimble axially to actuate each escapement, a plurality of rock shafts mounted on said frame, an arm slidably and non-rotatably mounted on each rock shaft, means connecting each arm with one of said cam means, means connecting said rock shafts and said keys to operate said rock shafts in response to operation of said keys, a justifying drum rotatably mounted on said frame, a plurality of spirally disposed ratchet teeth on said drum, the pitch of said last named teeth continuously increasing from one end of said drum to the other, a spacing escapement on said base and cooperating with the teeth on said drum to control the step by step movement of said base in accordance with the pitch of the teeth on said drum, spring means for rotating said drum in one direction, a brake for preventing rotation of said drum, a manually operable key for releasing said brake and linkage means operable by said space bar to actuate said spacing escapement whereby upon determining the number of character spaces and word spaces in a line of printing said drum may be rotated to provide the proper pitch of the teeth thereon in engagement with said spacing escapement to justify such line of printing.

## INTRA LENS SHUTTER

Waldemar Traugott Rentschler, Calmbach (Enz), Germany, assignor to Alfred Gauthier G. m. b. H., Calmbach (Enz), Germany, a corporation of Germany

Application December 17, 1952, Serial No. 326,466
Claims priority, application Germany January 26, 1952
13 Claims. (Cl. 95—11.5)

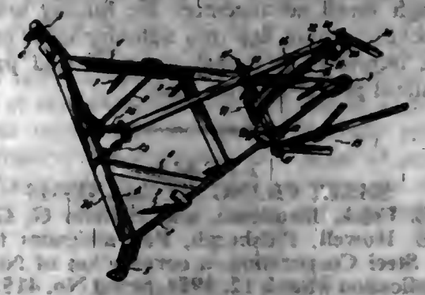
1. A photographic intra-lens shutter of the type provided with a flash contact comprising a set of normal shut-

ter blades, a power system for actuating said normal shutter blades, a set of cover shutter blades, a second independent power system for actuating said cover blades, means to simultaneously set both of said power systems, release means to release said cover blade power system and

close the flash contact, said cover blade power system being provided with means to release said normal power system, the arrangement of parts being such that a predetermined time lag exists between the time the flash contact is closed and the time the normal shutter blades are opened.

---

2,772,615
REVERSIBLE DISC PLOW
Fred T. Smith, Golden, Colo., assignor, by mesne assignments, to The Calhoun Manufacturing Company
Application November 29, 1952, Serial No. 323,189
4 Claims. (Cl. 97—31)



4. A reversible disc plow comprising a draft frame adapted to be supported by a tractor, a generally horizontal plow beam pivotally secured forwardly of its center to the rear portion of said frame for movement about an upright axis, plow discs on the beam for engagement with the soil, a rearwardly projecting horizontal arm freely pivoted to the rearward portion of the beam, adjustable stops carried by the beam limiting arcuate movement between the beam and the arm, a vertical spring arm comprising a member rigid in a transverse plane and resilient only in an upright plane extending through said horizontal arm, said member being secured to said arm and extending downwardly therefrom, and a substantially flat upright sub-soiling blade disposed for soil penetration and having a soil penetrating edge sloping forwardly and downwardly in the direction of movement, said blade being fixed to the lower extremity of said vertical spring arm, whereby side thrust of the plow discs is transmitted to the sub-soiling blade through said horizontal arm and stops.

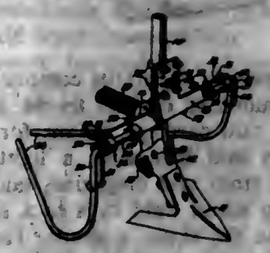
---

2,772,616
POWER LIFTING DEVICE APPLICABLE TO AGRICULTURAL IMPLEMENTS
Angel Rodriguez Gonzalez, Remedios, Las Villas, Cuba
Application September 15, 1953, Serial No. 380,257
1 Claim. (Cl. 97—47.62)

A power lifting device, applicable to agricultural implements, comprising a frame, a transverse bar fixed to and adjacent the front end of said frame, links for connecting said crossbar to the hydraulic system of a tractor, a flexible bar rising perpendicularly from said transverse bar, brace bars disposed at the front and rear of said flexible bar and fixed to said transverse bar, a tie bar extended downwardly and rearwardly from the top of said flexible bar, two divergent chains connecting the rear end of said tie bar with said frame, the forward end of said tie bar being perforated and a Y-shaped piece having a stem extending down through the perforation in

said tie bar, means clamping the lower end of said stem to said flexible arm, and a link having one end pivotally connected between the arms of said Y-shaped piece with the other end of said link being adapted for attachment to the hydraulic lifting system of the tractor.

---

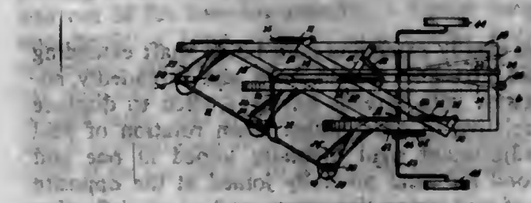


2,772,617
AGRICULTURAL IMPLEMENTS
Lawrence N. Tangeman, Beatrice, Nebr., assignor to Dempster Mill Manufacturing Company, Beatrice, Nebr., a corporation of Nebraska
Application December 17, 1952, Serial No. 326,421
5 Claims. (Cl. 97—47.65)

5. In a tractor having a rear axle housing and a pair of rearwardly extended parallel lift arms to which is attached a frame member of an agricultural implement, a ground engaging and cutting element adapted to cut through the ground ahead of such implement and steerably mounted on said frame member for steering movement about a vertical axis, a forwardly extending steering lever operatively connected at its rear end to said ground engaging element, and means connecting the forward end of said steering lever to said lift arms to shift said lever automatically as an incident to undesired lateral displacement of said implement in a given lateral direction relative to said tractor to impart steering movement to said ground cutting element in an opposite corrective direction and in an amount proportional to the undesired lateral displacement of said implement.

---

2,772,618
LEVELING ATTACHMENT FOR CULTIVATORS
Paul A. Schmidt, Mendota, Ill.
Application October 26, 1953, Serial No. 388,128
3 Claims. (Cl. 97—56)



1. A leveler attachment for a cultivator including a generally vertical supporting shank and a cultivator shoe

carried by the lower end of the shank, said attachment comprising a bracket, mounting means on the bracket to secure it to the supporting shank above the shoe, a pair of arms pivoted to the bracket on opposite sides of the shank on a common horizontal axis, the arms extending downward at opposite sides of the shoe and terminating in horizontal converging end portions trailing the shoe, coil springs engaging the arms at one end and connected to the bracket at their other ends urging the arms about their pivots in a direction to move the end portions downward, and collars adjustably secured to the arms and having locking screws projecting radially therefrom to engage the bracket and limit movement of the arms in said direction.

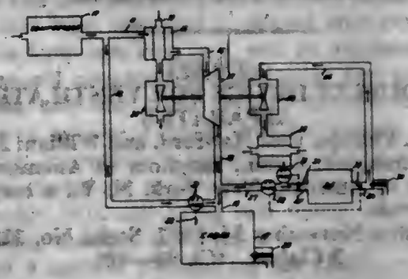
---

2,772,619
GANG PLOWS
Edward N. Benedict, Warren, Ohio, and Watson G. Pfouts, Pittsburgh, Pa.
Application September 3, 1953, Serial No. 378,274
3 Claims. (Cl. 97—93)

3. In a gang plow construction, a frame, plow beams on the frame having depending curved portions, a horizontal bore on each depending portion below and substantially parallel to the main portion of the beams, a pin in said bore, a landside pivoted on said pin, a plowshare and moldboard fixed to said landside and pivotal therewith, a rod extending transversely across the top of each moldboard, means pivotally connecting the top edge of each moldboard with said rod, lever means pivoted on the frame, link means connecting the lever means and the connecting rod and moving the connecting rod transversely across the top of the moldboards whereby the moldboards and landsides are pivoted in unison about the pins in the depending ends of the plow beams, a vertical sleeve on each plow beam in advance of the depending portion, a crank arm rotatably mounted in each of said sleeves, coulter means rotatably mounted on one end of each crank arm, a second connecting rod connecting the ends of the crank arms opposite the coulters and extending generally transversely of the beams and parallel to the first connecting rod on the moldboards and means connecting the second connecting rod to the lever means whereby the said second rod moves simultaneously and proportionally to the connecting rod on the moldboards to rotate the crank arms in the vertical sleeves a proportional amount sufficient to maintain the coulters in a position in front of the cutting edge of the plow shares.

---

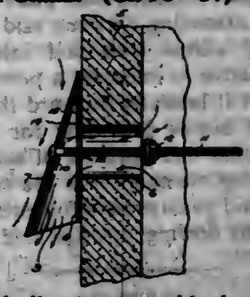
2,772,620
AIR INLET FOR SUPERSONIC AIRPLANE OR MISSILE
Antonio Ferri, Queens County, N. Y.
Application July 3, 1952, Serial No. 297,194
2 Claims. (Cl. 98—1)
(Granted under Title 35, U. S. Code (1952), sec. 266)



1. An air inlet for aircraft operating at supersonic speeds comprising a flow passage disposed substantially in line with the air stream, said flow passage having a forwardly facing opening in the air stream, and means in said flow passage to enable said passage to accept and decelerate the air with low external compression and with high pressure recovery, said means comprising at least one vane extending across said passage at the inlet end thereof, said vane extending downstream from adjacent the inlet end of said passage and having a streamlined

bulge intermediate its upstream and downstream edges, whereby to form a convergent divergent passage.

---



2,772,621
AIRCRAFT AIR CONDITIONING SYSTEM
Walter E. Arnold, West Hartford, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application November 16, 1953, Serial No. 392,104
13 Claims. (Cl. 98—1.5)

1. In combination with an aircraft air conditioning system of the type adapted to maintain cabin air at a selected temperature and including an air supply for the cabin, means to adapt the system to maintain air at another temperature in an isolated compartment which has an inlet and an outlet, said means including a first conduit interconnecting said air supply and said inlet, a second conduit interconnecting said outlet and said inlet, means in said second conduit for compensating the pressure drop in said compartment and for circulating air from said outlet to said inlet, and thermo-responsive flow control means in said first conduit adjacent said inlet and including a thermo-sensitive element disposed in said outlet.

---

2,772,622
WALL VENTILATOR
Carl J. Stower, Fort Lauderdale, Fla.
Application May 24, 1955, Serial No. 510,758
1 Claim. (Cl. 98—37)

A ventilator for hollow concrete block walls and whereby to create air circulation within the walls for discharge to the exterior, that comprises a hollow hood that is adapted to be disposed over an opening formed through an outer web of concrete block embodied in the wall, the said hood being semi-circular in cross-section and formed open at its rear side and bottom and with the open bottom defining a relatively large semi-circular air

discharge opening, the open rear of the hood defining an elongated upwardly tapering opening having marginal edges that are flat and co-planar and that are convergent upwardly and whereby to constitute an uninterrupted bearing surface throughout the height of the hood, a flat compressible weathering gasket for the hood that is shaped to conform to the rear opening and that is co-extensive with the marginal edges, the gasket being provided with an elongated opening having a dimension greater than the opening formed in the block, an insect screen co-extensive with and disposed over the gasket and with the hood, the gasket and the screen disposed in overlying relation to the face of the block and in overlying relation to the block opening and whereby the block opening is fully exposed through the opening of the gasket for communication with the hood and whereby air within the hollow block wall may be discharged through the discharge opening of the hood and a toggle bolt passing through the hood, the gasket and the screen and arranged co-axial with the block opening whereby a toggle head carried by the bolt may have clamping engagement upon the inner surface of the block web to either side of the block opening and whereby to securely clamp the hood and its associated gasket and screen in weathering engagement with the outer face of the block.

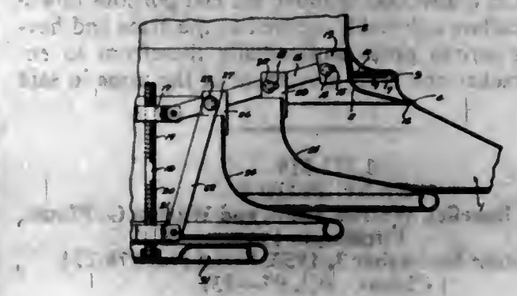
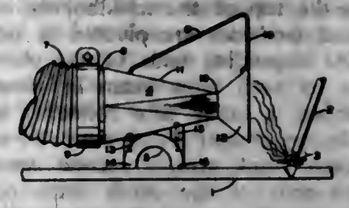
2,772,623
**AIR OUTLET DEVICE FOR VENTILATING APPARATUS**
Leonard R. Phillips, East Hartford, and William J. Waeldner, Farmington, Conn., assignors to Anemostat Corporation of America, New York, N. Y., a corporation of Delaware
Application November 24, 1952, Serial No. 322,265
3 Claims. (Cl. 98—40)



1. An air outlet device comprising an outer open-ended hollow flaring member, through the smaller or rear end of which air is supplied to the device, an inner hollow flaring member, and an intermediate open-ended hollow flaring member, said members being spaced apart to provide between them outer and inner passageways flaring forwardly relative to the longitudinal axis of the device for flow of supply air therethrough into an enclosure, a plate including stepped portions extending across the rear ends of said passageways, respectively said stepped portions having therein apertures disposed in side to side spaced apart relationship to each other to cause supply air flowing through said passageways to be divided into side to side spaced apart streams, said plate further including a flared portion extending between said stepped portions and substantially alined with said intermediate flaring member and effective to intercept a portion of the supply air and to deflect it laterally outward through said outer passageway, and means providing for flow of ambient air through the rear end portions of said inner and said intermediate flaring members into the rear end portions, respectively, of said passageways for intermixture with the supply air streams flowing through said passageways.

---

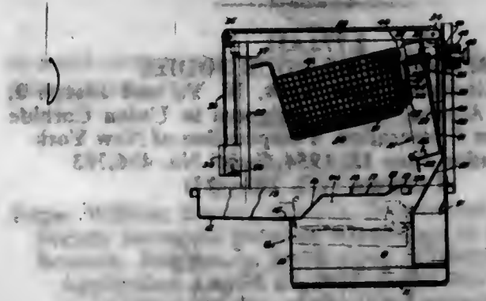
2,772,624
**DIFFUSER**
Wilbur R. F. Carnes, Madison, Wis., assignor to W. R. Carnes Company, Verona, Wis., a corporation of Wisconsin
Application November 6, 1952, Serial No. 319,146
9 Claims. (Cl. 98—40)



6. In a diffuser the combination comprising an outer circular shell, a first hub centrally disposed within said shell for axial movement with respect to said shell, a plurality of supporting struts angularly spaced about said first hub and each extending between and cooperatively engaged with said first hub and said shell by a tiltable connection with each and wherein one of the connections has a sliding engagement to allow for tilting movement and radial displacement of a strut end as said first hub is moved axially, a second hub axially spaced from said

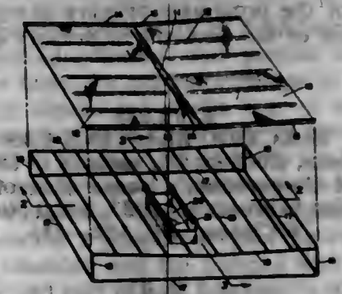
first hub, an axially extending adjustment shaft extending between said first and second hubs and threadedly engaged therewith with threads having a pitch to displace said hubs relative to one another upon rotation of said shaft, an adjustment strut pivotally joined at one end to said second hub and pivotally joined at the opposite end to one of said supporting struts, and an air deflecting shell carried by said supporting struts for axial movement upon rotation of said adjustment shaft.

---



2,772,625
**EXHAUST DEVICE**
John A. Clark, Jr., Wood River, Ill., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Application June 15, 1953, Serial No. 361,455
3 Claims. (Cl. 98—115)

1. A portable fume exhaust nozzle comprising a hollow body portion having at one end a narrow slot-like intake orifice elongated for collection of fume laden atmosphere over a linearly extending region of space and at the opposite end of said body portion an opening for discharging the collected fume to a flexible duct, a funnel mouth portion carried by said body portion and surrounding said elongated orifice, a permanent magnet mounted on one side of said body portion having poles projecting beyond the confines of said body and funnel mouth portions so that the poles are adaptable for attractive contact with a surface to which the nozzle is to be removably and adjustably attached near the source of fume evolution with an elongated dimension of said orifice nearest the surface, and disposed on the side of said body opposite said magnet a handle mounted on the nozzle and having an erect portion positioned adjacent said orifice and surrounding funnel mouth portion to project substantially perpendicularly away from the surface to which the nozzle is to be attached, said magnet being carried on said body portion and displaced from said handle so as to permit application of manual force by means of said handle with leverage on the magnet for removing the fume exhaust nozzle from the surface of attachment.



2,772,626
**SEMIAUTOMATIC FLOATING COVERS FOR FRY KETTLES**
Harold N. Shaw, Erie, Pa.
Application February 16, 1954, Serial No. 410,590
11 Claims. (Cl. 99—403)

1. In combination, a fry kettle having a fat receiving portion, a cover of a size to fit within said fat receiving portion, a food basket of a size to fit within said kettle, guiding means for directing movement of said cover into and out of fat covering position, a basket hanger above said kettle, a latch adjacent said hanger positioned to releasably maintain said cover in raised position means for elevating said cover to a position where it is engaged by said latch, said latch having a movable release portion which is positioned to be engaged by said basket when the latter is on the hanger to permit release of said cover.

---

2,772,627
**DISPOSABLE BROILER PANS**
James T. Newell, Eugene, Oreg.
Application November 5, 1954, Serial No. 466,960
2 Claims. (Cl. 99—425)

1. In combination, a grill for supporting a broiler pan sheet, said grill comprising a pair of spaced substantially parallel side supporting members, a plurality of spaced supporting members extending transversely of said side members and having their opposed ends secured thereto, means for supporting said longitudinally extending and transversely extending supporting members in elevated position, said longitudinally extending members being bent into a substantially V-shaped configuration and having at least one of said transverse supporting members disposed on opposite sides of the apex thereof, a receptacle detachably secured to said last-named transversely extending supporting members and depending below all of said supporting members, a disposable broiler pan supported on said supporting members and comprising an elongated sheet of material having a substantially V-shaped longitudinal cross-sectional configuration conforming to and complementing the V-shaped configuration of said grill, said sheet having a trough formed therein and projecting laterally from a side thereof at the apex of said sheet, said trough having a drainage aperture formed therein and disposed within said receptacle, a plurality of spaced parallel ribs formed in said sheet and projecting away from the other side of said sheet, and each longitudinally extending edge of said sheet having a flange projecting away from said other side of said sheet.

2,772,628
**BALE METERING AND TRIPPING MECHANISM**
Edwin R. Nolt, New Holland, Pa., assignor to Sperry Rand Corporation, New Holland, Pa., a corporation of Delaware
Original application September 6, 1950, Serial No. 183,321. Divided and this application November 26, 1952, Serial No. 322,717
2 Claims. (Cl. 100—4)

1. In an automatic hay baler comprising a bale case, a plunger normally reciprocable therein, and a normally non-operating banding means for forming bands around completed bales, the combination comprising a latch mounted on said bale case for movement into operative engagement with the plunger to lock said plunger in an advanced position, mechanism associated with said latch for moving said latch to and from an operative position in operative engagement with said plunger, said mechanism including a toggle arm pivoted on said bale case having an end pivotal between a first over-center position adjacent said bale case and a second over-center position remote from said bale case, and an overcenter spring having one end connected to said toggle arm end and at its opposite end connected directly to said latch, said spring urging said latch toward and away from its operative position responsive to positioning of the toggle arm end in its respective overcenter positions, a source of power, means interconnecting said source of power and said banding means, including a normally disengaged clutch and a control element for the clutch, and means directly connecting said control element to the latch whereby on movement of the latch said control element is actuated.

---

2,772,629
**SHELL LOADING PRESS**
Lyle S. Corcoran, Hollywood, Calif.
Application February 25, 1954, Serial No. 412,476
1 Claim. (Cl. 100—283)

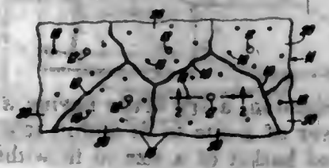
A hand operated tool for reloading ammunition shells comprising: a head; a base; three cylindrical guide rods securely anchored in said base and projecting upwardly therefrom; said guide rods being equidistantly spaced circumferentially and at a common radius from and parallel to a major axis of the press, said rods each having reduced externally threaded end portions at both ends thereof and having shoulders at the bases of said threaded portions; said head and base each having three bores through which said respective reduced threaded portions of the guide rods project; nuts threaded on said threaded portions and clamping said head and base against said shoulders; a plunger caged within the guide rods and having a cylindrical external surface bearing against all three of said guide rods in tangent relation to the surfaces of the guide rods, said plunger having therein a pair of slots; a pair of parallel flat bar links having their upper ends received

in said slots and pivotally connected to said plunger on an axis extending diametrically thereof; a bell crank lever including a handle portion at one end and a bifurcated lever portion at its other end, said bell crank being pivotally connected to said base on an axis disposed diametrically thereof and parallel to said axis of pivotal connection of the links to the plunger, said bifurcated lever portion including respective furcations spaced laterally, straddling one of said guide rods; and pivots connecting the lower ends of the respective links to the outer ends of the respective furcations; said links closely embracing said one guide rod; said bell crank being operative to move said plunger upwardly when the handle is moved downwardly; said plunger being in the form of a solid metal cylinder having a central bore in which a shell reloading tool may be positioned.

---

2,772,630
METHOD AND MEANS OF DECORATING METAL STRIP, BY OFFSET PRINTING
Jerome R. Shaw, Chicago, Ill., assignor to Litho-Strip Corporation, a corporation of Illinois
Application August 28, 1952, Serial No. 306,815
5 Claims. (Cl. 101—228)

1. In apparatus to print repetitive patterns on metal strip, the improvement wherein the moving strip drives the printing mechanism in synchronism therewith and wherein vibrations in the strip are damped out in the printing zone, comprising: power driven take-up means for pulling the strip through the apparatus; a rigid rotatable back-up roll at the printing zone; first roller means positioned on one side of the back-up roll, bearing against the strip, and causing a pronounced change in the direction of strip travel; second roller means positioned on the other side of said back-up roll, bearing against the strip, and causing another pronounced change in the direction of strip travel, said first and second roller means pressing said strip against said back-up roll so that the movement of said strip drives said back-up roll in synchronism therewith; printing rollers positioned to print on said strip while the same is in contact with said back-up roll; means whereby said back-up roll drives said printing rollers; and means whereby the unprinted strip is supplied to the apparatus.

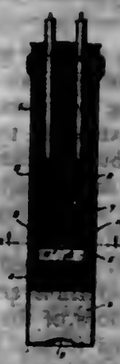


---

2,772,631
METHOD OF LOCATING PICTORIAL CUTS ON NEWSPAPER PAGES
Arnold L. Isaacson, Menicone, Mass.
Application April 26, 1955, Serial No. 504,071
1 Claim. (Cl. 101—426)

The method of arranging cuts of photographs, drawings and the like interspersed with type impressions on the pages of newspapers and similar printed matter for the improved reproduction of said cuts comprising the steps of registering in sequence individual transparent sheets on each of the makeup forms of pages planned and arranged in advance of similar forms for the pages which are to be ultimately printed in back to back relation on the reverse side of each of the pages for which said first forms were prepared, marking on the transparent sheets registered with each of said first prepared forms an outline of the location of the cuts positioned on the forms, then as each of said reverse page forms is being made up, registering the transparent sheet bearing the outline of the cuts to be printed in said backed relation, and, with the marked face of said sheet against said form locating the cuts planned for said reverse page form to coincide in printing location with the printing location of the marked outlines of the cuts of the first prepared form.

---

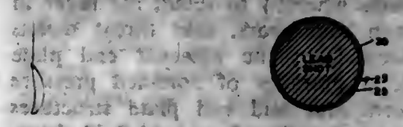


2,772,632
BLASTING OF ROCK BODIES
Robert B. Aitchison, New York, N. Y., and Joseph J. Calaman, Aurora, Minn., assignors to Union Carbide and Carbon Corporation, a corporation of New York
Application June 15, 1954, Serial No. 436,763
5 Claims. (Cl. 102—23)

1. In the art of blasting difficult-to-fragment rock bodies, the process which comprises, providing at least one row of substantially vertical primary blast holes in said body, said rows being substantially parallel to a face of said body; providing a plurality of smaller diameter substantially vertical satellite blast holes positioned in proximity with and around each of said primary blast holes, said satellite holes having a shallow depth relative to the depth of said primary blast holes; charging each of said primary and satellite blast holes with an explosive charge; successively detonating, in the order of their distance from said face of said body, each row of said primary explosive charges; and detonating each plurality of satellite charges up to about 50 milliseconds after the detonation of the proximate primary charge but before the detonation of the next row of primary charges.

---

2,772,633
ELECTRIC BLASTING CAP
Aldo J. Barocca, Godfrey, Ill., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Application February 25, 1953, Serial No. 338,743
6 Claims. (Cl. 102—28)



1. In an electric blasting cap having an electric heating element and an ignition composition in contact with said element, said composition comprising a substantial amount of lead trinitroresorcinate intimately mixed with a substantial amount of cyclotrimethylenetrinitramine.

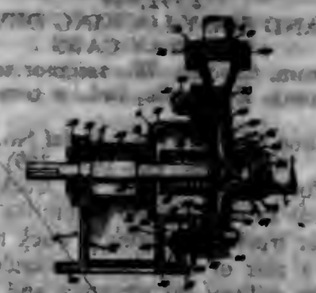
---

2,772,634
SHOTGUN CARTRIDGE AND SHOT FOR THE SAME
George G. Oberfell, Bartlesville, Okla.
Application February 16, 1950, Serial No. 144,588
4 Claims. (Cl. 102—42)

2. Shot for use in shotguns comprising metal pellets coated with a coating consisting essentially of barium salts of substituted phenol-formaldehyde condensate, said coating being sufficiently thick to inhibit oxidation, metal

to metal contact and welding and sticking together of the pellets during use.

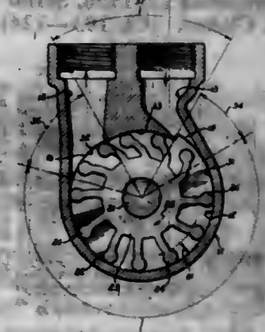
---



2,772,635
RIFLE GRENADE
Edgar William Brandt, Geneva, Switzerland, assignor to Societe Anonyme Belge de Mecanique et d'Armement, Brussels, Belgium, a corporation of Belgium
Application August 17, 1953, Serial No. 374,532
Claims priority, application Luxemburg September 15, 1953
2 Claims. (Cl. 102—65.2)

1. A rifle grenade adapted to be fired from a launcher fixed at the end of a firearm, said grenade comprising a charge carrier body, an explosive charge in said carrier body, a vaned tubular tail at the rear of said body to stabilize the grenade on its trajectory, an axial and cylindrical chamber in the rear of said body, the front part of said chamber being in said charge and the rear part of the chamber extending rearwardly an equal distance in said tail, providing a peripheral space between the rear part of said chamber and the internal wall of said tail to receive the end part of said launcher, a striker carried by the front part of said chamber, an inertia base fuse inside said chamber, said fuse including a detonator lodged in the projecting part of said chamber when in inoperative position, and a safety device for retaining the detonator in inoperative position, the total length of said chamber being at least twice the length of said detonator.

---

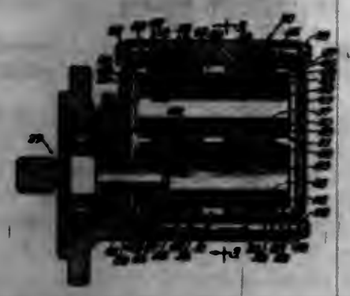


2,772,636
CENTRIFUGAL PUMP
De Witt E. Yates, Chippewa Falls, Wis., assignor to W. S. Darley & Co., Chicago, Ill., a corporation of Illinois
Application October 17, 1955, Serial No. 540,758
4 Claims. (Cl. 103—103)

1. A centrifugal pump adapted to displace a liquid and comprising a horizontally elongated tubular supporting structure provided at one end thereof with an outwardly extending annular flange, a volute casing positioned adjacent to said one end of the supporting structure, consisting of a front wall, a rear wall and a continuous spiral side wall between the outer margins of the front and rear walls, having in the central portion of the front wall thereof an inlet with means for connecting it to a source of the liquid to be pumped, embodying on the portion of its side wall that is of maximum radius a substantially tangential outlet with means for connecting it to a discharge pipe, having a hole in the central portion of its rear wall, and provided on the outer margin of said rear wall with a right angle flange in the form of a cylindrical rearwardly extending flange part that extends snugly around, and is rotatable with respect to, the outwardly extending flange on said one end of the supporting structure and forms with the last mentioned flange a mounting arrangement whereby the casing may be rotatively adjusted with respect to the supporting structure in order properly to position the outlet with respect to the discharge pipe and an annular flange part that is connected to, and extends outwards from, the rear end portion of said cylindrical flange part and is provided with a plurality of spaced apart rearwardly extending lugs with open ended screw threaded holes in the imaginary center lines of which are normal to and intersect the rear side surface of said outwardly extending flange on the one end of the supporting structure, setscrews extending through, and in screw threaded relation with, the holes in the lugs and adapted when tightened to have the inner ends thereof so grip said rear side surface of the outwardly extending flange on the one end of the supporting structure that they serve not only to lock the casing in its various adjusted positions with respect to said supporting structure but also firmly to clamp the rear wall of the casing against said one end of the supporting structure, a horizontal drive shaft extending centrally and longitudinally through the supporting structure and arranged so that the front end thereof extends through said hole in the central portion of the rear wall of the casing and into the casing interior, and an impeller disposed within the casing interior and mounted on, and connected for drive by, said front end of the drive shaft.

---

2,772,637
IMPELLER PUMP
Warren Doble, North Hollywood, Calif., assignor, by mesne assignments, to Jabsco Pump Company, Burbank, Calif., a corporation of California
Application March 20, 1952, Serial No. 277,595
4 Claims. (Cl. 103—117)



1. In a device for pumping a fluid, the combination of: a housing having therein a generally cylindrical impeller chamber providing an axis and provided with a peripheral wall, said housing also having therein inlet and outlet passages for the fluid to be pumped, said inlet and outlet passages respectively terminating in inlet and outlet ports which communicate with said impeller chamber, said peripheral wall including a first circumferentially extend-

ing segment of a maximum radius relative to said axis, a second circumferentially extending segment of a gradually decreasing radius relative to said axis and a third circumferentially extending segment of a minimum radius relative to said axis, said peripheral wall having a substantially radial segment relative to said axis at the junction of said third and first circumferentially extending segments so that the radius of said peripheral wall relative to said axis increases abruptly from said minimum to said maximum at the junction of said third and first circumferentially extending segments, said inlet port having a first edge located substantially in radial alignment relative to said axis with said radial segment of said peripheral wall, and having a second edge circumferentially spaced from said first edge thereof and located intermediate the ends of said first circumferentially extending segment, said outlet port communicating with said chamber adjacent said second circumferentially extending segment, and said third circumferentially extending segment being located intermediate said inlet and outlet ports; an externally driven shaft extending into said impeller chamber with its center line coinciding with said axis; and an impeller rotatable in said impeller chamber and having radially extending, flexible vanes the radii of which relative to said axis are at least equal to said maximum radius when said vanes are unflexed so that the ends of said vanes are engageable with each of said first, second and third circumferentially extending segments of said peripheral wall, said impeller being rotatable by said externally driven shaft in a direction to move said vanes over said first, second and third circumferentially extending segments in that order to pump fluid entering said impeller chamber through said inlet passage and said inlet port into said outlet port and said outlet passage, said vanes snapping from engagement with said third circumferentially extending segment into engagement with said first circumferentially extending segment as they move across said inlet port from a position where they are substantially in radial alignment relative to said axis with said first edge of said inlet port to a position wherein they are substantially in radial alignment relative to said axis with said second edge of said inlet port, whereby the energy released by said vanes as they snap from engagement with said third circumferentially extending segment into engagment with said first circumferentially extending segment in moving across said inlet port is transferred to the fluid in said inlet port and said inlet passage to draw it into said impeller chamber.

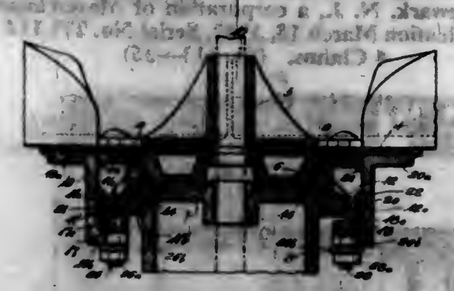
---

**2,772,638**
**GEAR PUMP OR MOTOR**
John L. Nagoly, Lagrange, Ohio
Application September 13, 1950, Serial No. 184,612
22 Claims. (Cl. 103—126)

1. In a gear-type liquid displacement device of the character described, a housing, a pair of end plate structures mounted in said housing in sealing relation therewith and in spaced relation to each other to form with said housing a fluid chamber therein, a pair of meshed gears mounted in said chamber between said end plate structures, a pair of gear shafts carrying said gears and having their opposite ends journaled in the respective end plate structures, and thrust means mounted on said shafts at the ends thereof in operative relationship with said end plate structures whereby to retain the latter in operative relation with said gears, said thrust means having portions spaced from the adjacent end plate structures to provide a plurality of confined pressure chambers therebetween, and said end plate structures having fluid passageways extending from said fluid chamber to said pressure chambers whereby to urge said end plate structures inwardly against the gears by means of fluid under pressure.

---

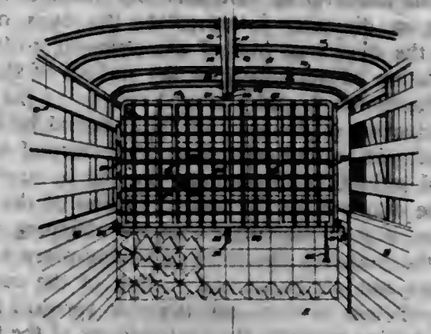
**2,772,639**
**STORAGE INSTALLATIONS IN PARTICULAR WITH TRACTION CABLE**
Hans Ingold, Lucerne, Switzerland
Application August 29, 1952, Serial No. 307,036
Claims priority, application Switzerland December 12, 1951
7 Claims. (Cl. 104—202)



1. Drive means for displaceable storage containers, shelves and like devices comprising at least two traction elements arranged for continuous movement in opposed direction to each other and accommodated below said storage containers, supporting means for said containers means supported by at least one of said containers and constructed for coaction with one of said elements, said latter means including an axle disposed on the lower portion of said one container, an operable member connected to said axle and extending therefrom outside of said one container for manipulation by an operator, respective movable and stationary clamping means supported by said lower container portion, said stationary clamping means slidably supporting said traction elements, respectively, said movable clamping means being, respectively, actuatable by said operable member against one of said stationary clamping means to thereby couple the latter with one of said traction elements for movement therewith and against another of said stationary clamping means to thereby uncouple said one stationary clamping means and to couple said other stationary clamping means for movement with the other traction element, means operatively connected to and normally maintaining said movable clamping means in uncoupled position and brake means mounted for displacement about said axle and engageable with said supporting means of said containers, said brake means being operatively connected to and actuable by said operable member in predetermined positions of the latter.

---

**2,772,640**
**TRUCK AND BODY LOCKING DEVICE FOR RAILWAY CARS**
Karl F. Nystrom, Chicago, Ill., assignor to International Steel Company, Evansville, Ind., a corporation of Indiana
Application May 27, 1953, Serial No. 357,691
18 Claims. (Cl. 105—199)

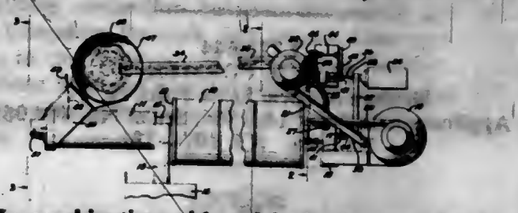


6. Means for locking railway car trucks with respect to a railway car structure while permitting orientation of the railway car truck comprising a truck bolster, a body center plate, a pair of lock bases extending parallel to the axis of the railway car structure and depending beneath opposite sides of said body center plate, said truck bolster having an annular portion interfitting with said body center plate, the annular portion of said truck bolster including diametrically disposed projections extending laterally therefrom, said lock bases having flanges on the lower extremities thereof directed toward said truck bolster, lock bars detachably mounted on said flanges in a position engaging the undersurface of said projections and in positions aligned with the side walls

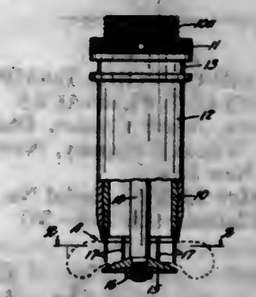
of the truck bolster, said lock bars being provided with curved faces on their opposite end portions forming limiting stops for the side walls of said truck bolster as said truck bolster orients during the negotiation of curves by the truck along a track system for establishing abutments beyond which said truck bolster is prevented from orienting.

---

**2,772,641**
**ADJUSTABLE PARTITION FOR CARS, TRUCKS AND WAREHOUSES**
Don Roberts, Wilkes-Barre, and Harold Heckenbury, Forty Fort, Pa., assignors, by mesne assignments, to said Roberts
Application July 23, 1952, Serial No. 300,402
2 Claims. (Cl. 105—369)



1. In a structure for use with trucks, freight cars or warehouses to hold partial or whole loads of stored merchandise in predetermined positions, a movable partition, a support positioned above the storage space, and a track secured to said support comprising two longitudinal angle members held in fixed relation to each other with a narrow longitudinal slot between the lower flanges thereof, and a connecting element between said track and said partition, said connecting element including a T-shaped member having laterally extending arms adapted to rest on the upper surface of the lower flanges of said track angle members and longer than the width of said slot and too thick to pass through said slot, the vertical element of said T-shaped member having a thickness with respect to the width of said slot as to permit said T-shaped member to be rotated in said slot, and said T-shaped member being rigidly connected to said arms thereof and connected to said partition and said T-shaped element being capable of rocking on said arms resting on the flanges of said track and said vertical element extending downwardly through said slot and free to slide lengthwise thereof.

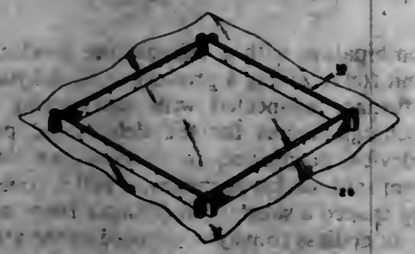


**2,772,642**
**DEHYDRATING AND PELLETING APPARATUS**
Gordon J. Lindi, Milwaukee, Wis., assignor to Arnold Dryer Co., Milwaukee, Wis., a corporation of Wisconsin
Application June 8, 1954, Serial No. 435,271
3 Claims. (Cl. 107—4)

1. In combination with a dehydrating machine having a drying unit for receiving a product to be dehydrated and having a furnace connected with said drying unit and having discharge means for the dehydrated product, a pelleting device positioned to receive the dehydrated product from said discharge means, a pellet cooler having an open top spaced a substantial distance from said pelleting device, an endless conveyor exposed to the atmosphere having one end positioned to receive pellets from the pelleting device and having its other end positioned to discharge pellets by gravity into the open top of said cooler, means for drawing atmospheric air into said cooler around said stream of falling pellets and through the pellets in the cooler so that said air cools the pellets while they are falling from the conveyor and while in the cooler and so that said air itself becomes preheated, and means for conducting said preheated air into said dehydrating machine for use as a drying medium and to furnish the secondary combustion air for the furnace.

---

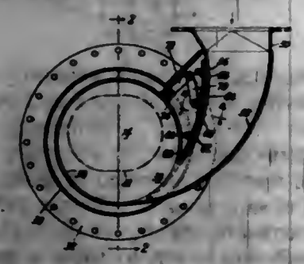
**2,772,643**
**METHOD AND APPARATUS FOR PRODUCING DOUGHNUT DOUGH FORMATIONS HAVING SCALLOPED INNER AND OUTER PERIPHERAL SURFACES**
William R. Coyne, Minneapolis, Minn., assignor to Pillsbury Mills, Inc., Minneapolis, Minn., a corporation of Delaware
Application August 18, 1951, Serial No. 242,474
7 Claims. (Cl. 107—14)



4. Apparatus for producing generally annular dough formations having scalloped inner and outer peripheries, said apparatus comprising a generally upright hollow cylindrical extrusion spout, a centrally disposed hole-forming island member mounted in spaced relation below the lower end of said spout a sufficient distance to produce a peripheral extrusion opening at the bottom of the spout member of sufficient depth to form a generally annular dough formation when extruded therethrough, a cutoff sleeve slidably mounted on said spout and closing said opening by engagement with said island member when disposed in downwardly projected position, a plurality of peripherally spaced dough severing fingers extending between the top surface of said island member and the lower end of said spout and traversing substantially the entire distance therebetween to sever into a plurality of annularly arranged separate individual segments when dough is extruded through the peripheral opening between

the spout and island member when said cutoff sleeve is in raised position, the severing fingers being only of sufficient width and depth with respect to the thickness of the extruded dough segments to permit said segments to subsequently flow together when cut off by downward projection of said cutoff sleeve to close said opening.

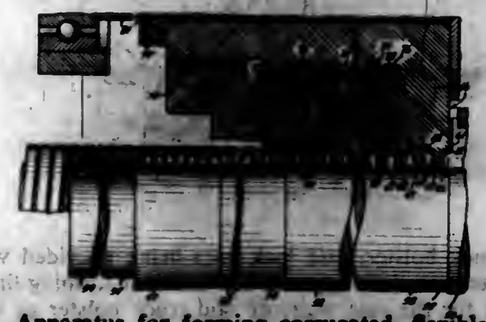
---



**2,772,644**
**FUDGE FORMER**
**Stephen Musica, Little Falls, N. Y.**
**Application January 14, 1954, Serial No. 404,065**
**1 Claim. (Cl. 107—19)**

A light weight open square fudge mold consisting of four interlocking elongated bars of uniform thickness of styrene having a smooth non-adhering surface, unaffected by temperatures used in the making of fudge, each bar having one long narrow face having five equi-spaced transverse indentations therein for guiding a knife in the cutting of the fudge into blocks of uniform size and thickness when the fudge in the mold has hardened to the desired consistency, and two locking slots spaced as far from the proximate indentations as the distance between indentations, said slots extending half way between the narrow faces of the bar and being of a width equal to the thickness of the bar, the space from the end of the bar to the proximate slot being greater than the width of the slot, each bar having at its opposite long narrow face guiding indentations spaced equally from the inside corners of the square mold when assembled to correspond with the indentations on said one face, so that a bar may be used either up or down, and the four corners of the bars being rounded at the junctions of the ends and the narrow faces, said four bars being identical so that the fudge mold can be formed by a single die.

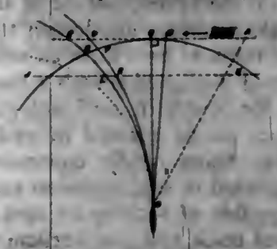
---



**2,772,645**
**FUEL AND AIR CONTROL DAMPER FOR CYCLONE FURNACES**
**Ralph M. Hardgrove, North Canton, Ohio, assignor to The Babcock & Wilcox Company, New York, N. Y., a corporation of New Jersey**
**Application May 22, 1952, Serial No. 289,377**
**5 Claims. (Cl. 110—28)**

1. Fuel burning apparatus comprising means defining a furnace chamber, a fuel inlet chamber communicating with said furnace chamber and having a curved wall forming substantially the entire peripheral wall thereof, means for supplying a combustible mixture substantially tangentially to the peripheral wall of said fuel inlet chamber comprising a fuel supply conduit having curved converging plates forming the inner and outer walls thereof, and a slidably mounted damper having a curvature corresponding to the curvature of said conduit inner wall and movable therealong in closing relationship to said outer wall to a position forming an extension of the chamber end of said inner wall in the curvilinear plane thereof.

---



**2,772,646**
**MAKING AND COMPRESSING CORRUGATED FLEXIBLE HOSE IN ONE OPERATION**
**Philip M. Padgett, Newark, N. J., assignor to Titeflex, Inc., Newark, N. J., a corporation of Massachusetts**
**Application March 18, 1952, Serial No. 277,114**
**4 Claims. (Cl. 113—35)**

1. Apparatus for forming corrugated, flexible tubing, including a multi-section mandrel and guide means that feed a longitudinally corrugated strip to the mandrel in a direction to wrap in a helix around the mandrel with the edges of adjacent convolutions engaging one another to form a seam, and a roller with its axis of rotation radially outward from the mandrel and adjacent to the mandrel and having fins which extend into the corrugations of the tubing to strip the tubing from a first section of the mandrel progressively as the tubing is formed on said first section, the fins on the roller being of progressively less width toward the discharge end of the mandrel for crowding at least the upper parts of the corrugations together as they are progressively stripped from the first section of the mandrel by said fins, the mandrel having a reduction in diameter intermediate the ends of the roller near the discharge end of the stripping roller for relieving friction of the tubing on the surface of the first section of the mandrel, and a second section of the mandrel, the reduction in diameter of the mandrel being the beginning of said second section, and the second section beyond said reduction in diameter having a taper that increases the diameter of the second section of the mandrel to a size that frictionally resists the stripping of the tube from the mandrel, the increase taking place toward the discharge end of the second section of the mandrel and being sufficient to cause resistance to forward movement of the tubing whereby the corrugations of the tubing are further crowded together as the stripper roller forces the tubing over the second section of the mandrel beyond the stripping roller and beyond the location of said reduction in diameter.

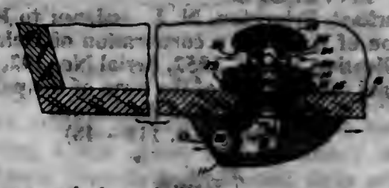
**2,772,647**
**SPECIAL COURSE TORPEDO**
**David C. White, Honolulu, Territory of Hawaii**
**Application April 27, 1951, Serial No. 223,427**
**1 Claim. (Cl. 114—23)**
**(Granted under Title 35, U. S. Code (1952), sec. 266)**



The method of effecting an intecept of a torpedo adapted to be launched from a submarine with a target moving in water along a substantially fixed course of unknown range from the submarine and at a continuing substantially constant but unknown speed, which comprises determining the rate of change of bearing of the target relative to the submarine prior to launching the torpedo, and thereafter effecting movement of the torpedo along a circular arc course of predetermined radius, said radius being predetermined and commensurate with said rate of change of bearing.

**2,772,648**
**AUTOMATIC BOAT BAILERS**
**John L. De Persia, Grand Haven, Mich.**
**Application January 7, 1955, Serial No. 480,496**
**2 Claims. (Cl. 114—185)**

1. An automatic boat bailer comprising a housing provided with an upstanding pipe section adapted to be inserted upwardly through a hole in a boat bottom, said housing having a rounded nose portion and rear face sloping upwardly and outwardly from the bottom to the top thereof, there being a passage formed in said housing extending inwardly from the portion of the top enclosed by said pipe section to and out of the sloping rear face, means securing said housing exteriorly of and on the boat bottom with said pipe section received in the hole provided and with said face facing the stern of the boat, said pipe section being formed with an annular recess at the lower end thereof, a valve seat extending transversely across said pipe section and partially bridging the end of the passage opening through the top of the housing and having its periphery received in said recess, a freely floatable ball in said passage seatable on said valve seat to prevent passage of water upwardly through said pipe section, and a plug threadedly engaged in said pipe section at the upper end thereof, said plug being provided with a bore extending upwardly from its lower end and terminating adjacent the upper end, and ports in said plug adjacent the upper end connecting in communication with said bore, said plug being movable in said pipe section from a position with said inlet ports open and in communication with the interior of the boat to a position closing said ports.

**2,772,649**
**MOTOR MOUNTING SYSTEM**
**Joseph R. Gensheimer and Victor J. Grunblatt, Erie, Pa., assignors to Lord Manufacturing Company, Erie, Pa., a corporation of Pennsylvania**
**Application June 1, 1954, Serial No. 433,760**
**7 Claims. (Cl. 115—5)**

1. A mounting system for an outboard motor having a housing having at its upper end a support for a vertical shaft motor and a depending vertical tubular section connected at its lower end to a gear casing for the propeller shaft, the housing with the tubular section and gear case comprising a structural unit, a pair of resilient mountings on opposite sides of the motor connected in load carrying relation between the motor and its support, a vertical driven shaft in the gear case, and a power transmitting connection between the motor and driven shafts extending through and spaced from the tubular section of the housing and including a flexible coupling of resilient material supplementing the mountings in resiliently resisting rocking of the motor about a horizontal axis.

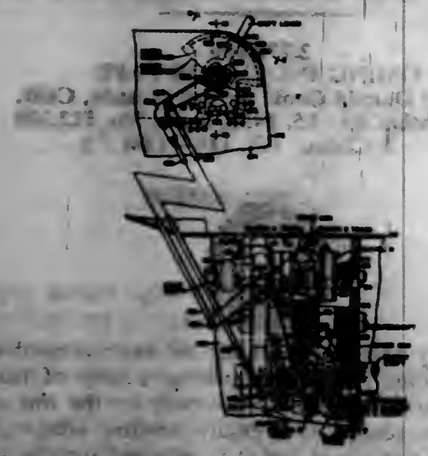
---

**2,772,650**
**TIMING INDICATOR TAPE**
**Edward Donald Cook, Arroyo Grande, Calif.**
**Application July 15, 1955, Serial No. 522,280**
**1 Claim. (Cl. 116—124)**

In a rotary balance wheel for an internal combustion engine, a timing marker comprising a strip of tearable flexible material disposed transversely on the rim of the wheel, and a coating of pressure-sensitive adhesive material on the surface of the strip adjacent the rim of the wheel, the other surface of the strip being darkened over its entire area except for a narrow area spaced midway between and extending parallel to the side edges of the strip.

---

**2,772,651**
**INSTRUMENT ILLUMINATOR**
**Gaetano V. Amico, Levittown, N. Y., assignor to the United States of America as represented by the Secretary of the Navy**
**Application August 21, 1952, Serial No. 305,719**
**11 Claims. (Cl. 116—129)**
**(Granted under Title 35, U. S. Code (1952), sec. 266)**



1. In an instrument device, a housing, an instrument window mounted in said housing, a dial spaced from said instrument window in said housing, a reflector mounted behind said dial, aligned apertures in said window and dial, a lighting assembly secured in said window aperture, said assembly being apertured in axial alignment with said dial and window apertures, and lamp means removably retained in the aperture in said lighting assembly, said lamp extending into said dial aperture to provide uniform edge, back and front illumination of the dial.

**2,772,652**
**TRANSMISSION AND CONTROL THEREFOR**
**Wallace H. Du Shane, Waterloo, and Vernon L. Rugen, Cedar Falls, Iowa, assignors to Deere Manufacturing Co., Dubuque, Iowa, a corporation of Iowa**
**Application August 8, 1955, Serial No. 526,971**
**13 Claims. (Cl. 74—337.5)**

1. A transmission and control therefor, comprising: input, output and countershafts; multi-range drive means

for driving the countershaft from the input shaft and including a range clutch shiftable among neutral and first and second active positions; multi-speed drive means for driving the output shaft from the countershaft and including a speed clutch shiftable among neutral and first and second active positions; a speed selector movable among neutral and first and second active positions for achieving corresponding positions of the speed clutch and having a laterally opening shifter-receiving notch; a shifter alongside and movable relative to said selector both laterally of and parallel to said selector and normally received in said notch; and a range selector movable par-

allel and relative to the speed selector among neutral and first and second active positions for achieving corresponding positions of the range clutch, said range selector having a bar portion opposed to the speed selector notch when both selectors are in neutral so as to confine the shifter to the speed selector notch, said range selector having additional notches angularly offset from said bar portion so that after the speed selector is moved by the shifter to either active position independently of the range selector said shifter may be moved laterally into one of said range selector notches whereby said shifter may move said range selector to either of its active positions independently of the speed selector.

2,772,653

**APPARATUS FOR COATING STRIP MATERIAL**

Donald G. Williamson, Skokie, Melvin W. Snover, Winnetka, and Hilmar A. Andresen and Raymond H. Andresen, Barrington, Ill., assignors to Williamson Adhesives, Inc., Skokie, Ill., a corporation of Illinois

Application May 12, 1955, Serial No. 507,794
10 Claims. (Cl. 118—43)

1. In a device for applying a liquid to one surface only of a flexible strip, a casing forming a reservoir for said liquid and a unitary removable sub-assembly providing with said casing an entrance and exit for a flexible strip into and out of said casing, said sub-assembly comprising a member having an arcuate surface operatively immersed in said reservoir, a doctor mounted on said member and having a non-rotating convex portion in opposed closely spaced relation to said arcuate surfaced member at a point on the exit side thereof and oppositely acting resilient and adjustable stop means also mounted on said member for holding said convex doctor portion in gauged relation to said member, whereby a flexible strip moved over the said arcuate surface from said entrance to said exit and passing between said opposed convex portion and said arcuate surface comes into contact with said liquid on one side of said strip only.

2,772,654

**APPARATUS FOR APPLYING A CONDUCTIVE COATING TO THE INSIDE OF A TUBULAR GLASS ENVELOPE**

Paul G. Herkart, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application June 6, 1952, Serial No. 292,156
The terminal fifteen years of the term of the patent to be granted has been disclaimed
3 Claims. (Cl. 118—48)

1. Apparatus for forming a transparent conductive coating on the inner closed end of an elongated tubular glass envelope, said apparatus comprising a support for said envelope, heating means near said support and adapted to surround said envelope and apply heat thereto, a hollow container near said heating means for holding a quantity of coating substance at one end thereof, a vaporizer within said container at said one end thereof for vaporizing said substance and directing the vaporized substance against the inner wall of said container, said vaporizer including a gas inlet tube provided with a plurality of restricted orifices extending radially outward towards the wall of said container and a plurality of liquid supply tubes having restricted openings positioned adjacent to said restricted orifices, a tubular member at another end of said container extending from and communicating with the interior of said container and adapted to have one end inserted within said tubular envelope with said one end closely adjacent to the area to be coated, and means including a peripheral ridge on the inner wall of said container intermediate said vaporizer and said tubular member for removing droplets from the vaporized substance.

2,772,655

**COATING APPLICATOR FOR FLEXIBLE STRIP MATERIAL**

Donald G. Williamson and Melvin W. Snover, Winnetka, and Hilmar A. Andresen and Raymond H. Andresen, Chicago, Ill., assignors to Williamson Adhesives, Inc., Skokie, Ill., a corporation of Illinois

Application May 14, 1953, Serial No. 355,094
10 Claims. (Cl. 118—126)

1. An applicator for applying a liquid to a flexible backing strip, which comprises an open-top casing having bottom, side and end walls, a separate wall member spaced from said bottom and one end wall and joined to said side and other end walls to form a reservoir thereabove for said liquid and a guiding surface under said reservoir, said other end wall having a slot for admitting said flexible strip for passage along said guiding surface,

a stationary member having an arcuate surface extending into said reservoir, a doctor blade resiliently urged toward said arcuate surface, and a closure for said open top providing a slot above said stationary member for the withdrawal therethrough of said strip after passage thereof through said reservoir in contact with said stationary member and past said doctor blade.

2,772,656

**FILTER IMPREGNATION INJECTION MACHINE**

Warner E. Remington, Davison, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application December 23, 1952, Serial No. 327,642
3 Claims. (Cl. 118—302)

1. In apparatus of the class described, a support, a pair of longitudinally extending spaced guide rails to support and guide a hollow rotatable member during longitudinal movement, a pair of rolls rotatably mounted on said support adjacent an end of said rails in longitudinal alignment therewith and positioned to receive the member from said rails and rotate and support the member, the length of said rails and said rolls being substantially the same and slightly greater than the length of said member, each of said rolls having an integral flange adjacent their inner ends to limit the longitudinal movement of said member and position said member on said rolls, means to rotate said rolls, an elongated nozzle having outlets mounted on said support and extending along and above said rolls toward said rails, a valve mechanism to close said nozzle outlets, means to supply fluid to said nozzle, means to supply air under pressure to said nozzle to clear the fluid from said nozzle, a reciprocating member mounted below said rolls, a wiper mounted on said reciprocating member and engaging said nozzle to clean said nozzle, means mounted on said reciprocating member to move said hollow member from said guide rails onto said rolls to surround said nozzle and off said rolls and away from said nozzle and onto said guide rails.

2,772,657

**FABRIC ARTICLE TREATING APPARATUS**

Samuel P. Parker, La Grange, Ga., assignor to Callaway Mills Company, La Grange, Ga., a corporation of Georgia

Application September 22, 1953, Serial No. 381,585
6 Claims. (Cl. 118—315)

1. An apparatus for treating articles with a liquid, which comprises an endless conveyor belt with an upper horizontal stretch, a hood above the belt having an open lower end lying close to the upper stretch of the belt, means for discharging a spray of the liquid downward through the hood toward the belt, a pan structure including a pan below the belt having bottom openings at opposite sides of the belt beneath the hood, ducts within the pan structure leading upwardly from the respective bottom openings to about the level of the upper stretch of the belt, a chamber below the pan structure and closed at the top by the bottom of the pan structure, the ducts being open at their lower ends to the chamber, and the chamber having an outlet opening, a condenser in front of the opening, an exhaust chamber connected through the outlet opening to the first chamber, and a fan for exhausting the exhaust chamber.

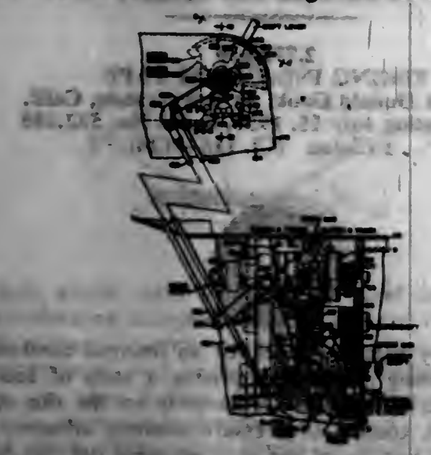
2,772,658

**SPRAYING APPARATUS FOR CEMENT LASTING**



Norman V. Germany and Stephen A. Makovski, Leicester, England, assignors to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey

Application April 24, 1953, Serial No. 351,098
Claims priority, application Great Britain May 9, 1952
3 Claims. (Cl. 118—323)

1. In combination, a spray booth, a spray gun, a support for said gun including a rotatable spindle mounted in said booth, means mounted in said booth for engagement with a work piece to position the same in fixed relation to the outlet end of said gun, manual means for rotating said spindle to move the gun in one direction through a limited curved path relatively to the work piece, means independent of said manual means for automatically rotating the spindle in the opposite direction upon release of said manual means, a trigger on the gun,

for driving the countershaft from the input shaft and including a range clutch shiftable among neutral and first and second active positions; multi-speed drive means for driving the output shaft from the countershaft and including a speed clutch shiftable among neutral and first and second active positions; a speed selector movable among neutral and first and second active positions for achieving corresponding positions of the speed clutch and having a laterally opening shifter-receiving notch; a shifter alongside and movable relative to said selector both laterally of and parallel to said selector and normally received in said notch; and a range selector movable par-

allel and relative to the speed selector among neutral and first and second active positions for achieving corresponding positions of the range clutch, said range selector having a bar portion opposed to the speed selector notch when both selectors are in neutral so as to confine the shifter to the speed selector notch, said range selector having additional notches angularly offset from said bar portion so that after the speed selector is moved by the shifter to either active position independently of the range selector said shifter may be moved laterally into one of said range selector notches whereby said shifter may move said range selector to either of its active positions independently of the speed selector.

**FILTER IMPREGNATION INJECTION MACHINE**

Warner E. Remington, Davison, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application December 23, 1952, Serial No. 327,642
3 Claims. (Cl. 118—302)

1. In apparatus of the class described, a support, a pair of longitudinally extending spaced guide rails to support and guide a hollow rotatable member during longitudinal movement, a pair of rolls rotatably mounted on said support adjacent an end of said rails in longitudinal alignment therewith and positioned to receive the member from said rails and rotate and support the member, the length of said rails and said rolls being substantially the same and slightly greater than the length of said member, each of said rolls having an integral flange adjacent their inner ends to limit the longitudinal movement of said member and position said member on said rolls, means to rotate said rolls, an elongated nozzle having outlets mounted on said support and extending along and above said rolls toward said rails, a valve mechanism to close said nozzle outlets, means to supply fluid to said nozzle, means to supply air under pressure to said nozzle to clear the fluid from said nozzle, a reciprocating member mounted below said rolls, a wiper mounted on said reciprocating member and engaging said nozzle to clean said nozzle, means mounted on said reciprocating member to move said hollow member from said guide rails onto said rolls to surround said nozzle and off said rolls and away from said nozzle and onto said guide rails.

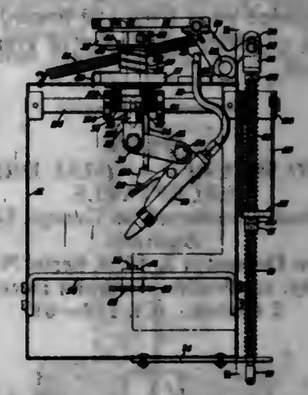
2,772,657

**FABRIC ARTICLE TREATING APPARATUS**

Samuel P. Parker, La Grange, Ga., assignor to Callaway Mills Company, La Grange, Ga., a corporation of Georgia

Application September 22, 1953, Serial No. 381,585
6 Claims. (Cl. 118—315)

1. An apparatus for treating articles with a liquid, which comprises an endless conveyor belt with an upper horizontal stretch, a hood above the belt having an open lower end lying close to the upper stretch of the belt, means for discharging a spray of the liquid downward through the hood toward the belt, a pan structure including a pan below the belt having bottom openings at opposite sides of the belt beneath the hood, ducts within the pan structure leading upwardly from the respective bottom openings to about the level of the upper stretch of the belt, a chamber below the pan structure and closed at the top by the bottom of the pan structure, the ducts being open at their lower ends to the chamber, and the chamber having an outlet opening, a condenser in front of the opening, an exhaust chamber connected through the outlet opening to the first chamber, and a fan for exhausting the exhaust chamber.



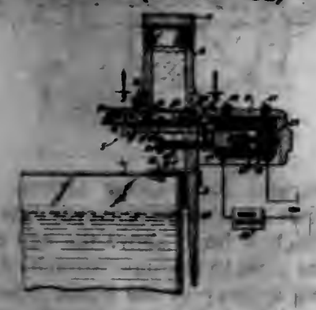
---

2,772,658

**SPRAYING APPARATUS FOR CEMENT LASTING**

Norman V. Germany and Stephen A. Makovski, Leicester, England, assignors to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey

Application April 24, 1953, Serial No. 351,008
Claims priority, application Great Britain May 9, 1952
3 Claims. (Cl. 118—323)



1. In combination, a spray booth, a spray gun, a support for said gun including a rotatable spindle mounted in said booth, means mounted in said booth for engagement with a work piece to position the same in fixed relation to the outlet end of said gun, manual means for rotating said spindle to move the gun in one direction through a limited curved path relatively to the work piece, means independent of said manual means for automatically rotating the spindle in the opposite direction upon release of said manual means, a trigger on the gun,

means associated with the spindle and operated by said manual means to actuate the trigger in any position of the gun, said trigger actuating means being operative to maintain the trigger in actuated condition during rotation of the gun in both directions, and means associated with said manual means and effective to cause the trigger actuating means to operate the trigger prior to initiation of the rotation of the gun in said one direction and to release the trigger at the conclusion of the rotation of the gun in said opposite direction.

---

2,772,659
FISH FEEDING DEVICE
Francis H. Tennis, Milwaukee, Wis.
Application January 11, 1954, Serial No. 403,418
8 Claims. (Cl. 119—51)

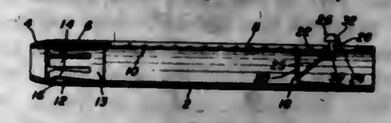
1. Apparatus for periodically dispensing a quantity of granular material such as fish food, said apparatus comprising: a body including a supporting bracket for mounting the apparatus above a location to which granular material is to be dispensed; means on said body defining a downwardly opening feed passage for granular material; a substantially horizontal trough on said body into which said feed passage opens, said trough having an open discharge mouth at one end thereof spaced a distance to one side of the outlet of said feed passage; a pusher movably mounted in the body for reciprocation in the trough toward and from the mouth thereof along a path adjacent to the outlet of the feed passage but spaced a distance therebeneath so that the pusher is incapable of blocking communication between the feed passage and the trough; means yieldingly biasing the pusher in one of its directions of reciprocation; and a solenoid mounted on the body and having a reciprocable plunger connected with the pusher to reciprocate the pusher so that in consequence of each cycle of energization and de-energization of the solenoid the pusher is moved away from and toward the mouth of the trough, for expelling a quantity of granular material out of the trough.

---

2,772,660
GROUND SECURED ANIMAL DRINKING RECEPTACLE
Leslie V. Saul, Elvanbrook St. George, Queensland, Australia
Application December 3, 1954, Serial No. 472,981
Claims priority, application Australia December 8, 1953
2 Claims. (Cl. 119—61)

1. An improved drinking receptacle, for dogs and other animals, comprising an annular trough with a central crown, said crown having a central aperture therein, a spike extending through said aperture, a head upon said spike adapted to pass through said aperture, said spike having a length sufficient to locate said head above said central crown when said spike is in anchoring engagement with the ground, and a flat hook pivotally mounted upon said central crown adjacent said aperture, said hook being pivotal between a first position wherein said hook is located between the head of said spike and said central crown to prevent withdrawal of said annular trough from said spike and a second position wherein said hook is located clear of the head of said spike.

---



2,772,661
CATTLE STANCHION AND LATCH
Paul O. Schilling and Arthur G. Mayer, Horicon, Wis., assignors to Gardner Manufacturing Company, Horicon, Wis., a corporation of Wisconsin
Application March 8, 1955, Serial No. 492,856
8 Claims. (Cl. 119—147)

1. In a stanchion, the combination comprising a first stanchion bar having an arm extending laterally, a movable stanchion bar having an upper end movable laterally relative to said first bar, a retractable locking bolt projecting from an upper end portion of the movable bar, said arm comprising a channel opening downwardly and provided interiorly with a strike plate between the channel sides in the path of the bolt and having one end disposed at an angle to said path to force the bolt to its retracted position in one direction of swinging movement of the last mentioned bar, said strike plate having a socket to which said bolt is guided in the course of its movement and into which said bolt is receivable to lock said last mentioned bar against retrogressive movement.

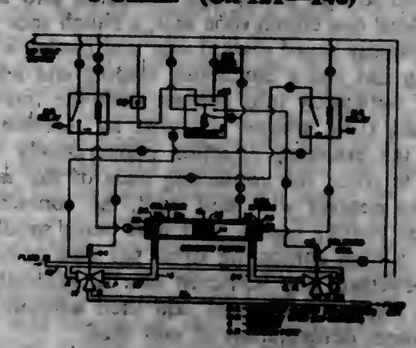
---

2,772,662
CRAYON HOLDER
Anthony N. Tamakumas, East Gary, Ind.
Application October 1, 1954, Serial No. 459,723
2 Claims. (Cl. 120—19)

1. A holder for crayons comprising a tubular member for receiving the crayon, the inside diameter of said tubular member being constant for the major portion of its length and slightly greater than the diameter of the largest crayon to be carried thereby, the inside diameter of said tubular member being reduced at its forward end so as to grip the largest crayon to be carried, said tubular member having an annular recess in its forward inner surface with a shoulder at each end, a resilient gripping member disposed in said recess, said gripping member being made of a sheet of spring-like metal having a solid rearward portion and a plurality of spaced fingers extending forwardly therefrom, said fingers being bent inwardly adjacent their ends to an inside diameter substantially the same as the smallest crayon to be carried, whereby said inside diameter is adjustable to the size of the largest crayon to be carried when the ends of said gripping member contact said shoulders, said tubular member having a slot therein extending from a point adjacent its rearward end to a point adjacent its forward end, a generally U-shaped spring member disposed in said tubular member adjacent its rearward end with the base of the U-shaped

member facing forwardly, and a member attached to the end of one of the legs of the U-shaped member and extending through said slot to the outside of said tubular member.

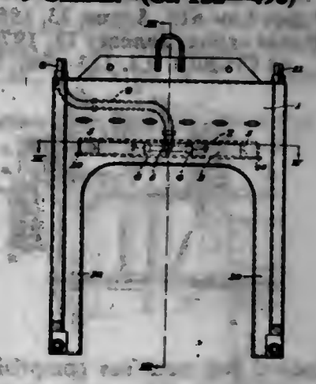
---



2,772,663
AIR DRIVEN SANDER
George A. Larson, Rockford, Ill.; Alice R. Larson, executrix of said George A. Larson, deceased, assignor to Alice R. Larson, Rockford, Ill.
Application May 14, 1954, Serial No. 429,868
16 Claims. (Cl. 121—3)

1. A reciprocating air motor comprising a cylinder having air inlet ports spaced inwardly from the opposite ends and air outlet ports spaced farther inwardly from said ends, a piston reciprocable in said cylinder, valves slidable as pistons relative to and adapted to cover and uncover the intake ports alternately and arranged to be engaged and moved outwardly by the piston, spring means normally urging said valves inwardly, a secondary cylinder in spaced parallel relation to the first mentioned cylinder having air exhaust ports spaced inwardly from the opposite ends communicating with said outlet ports, a slide reciprocable in said secondary cylinder and adapted to cover and uncover said exhaust ports alternately, and means connecting said piston and slide to reciprocate in unison.

---



2,772,664
FLUID FLOW METER
Clifton H. Jones, Nixon, and Charles W. Foust, Elizabeth, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Application December 11, 1953, Serial No. 397,598
1 Claim. (Cl. 121—148)

In an apparatus for measuring fluid flow through a conduit system including upstream and downstream sections of said system, a measuring cylinder closed at each end, a free piston within said cylinder adapted for reciprocal movement between the ends thereof, a pair of 3-way valves, each communicating with said cylinder at opposite ends thereof and alternately with each of said upstream and downstream conduit sections, electrical valve operating means adapted alternately to establish fluid flow into and from said cylinder from opposite ends from and to said respective upstream and downstream conduit sections, whereby said piston is moved reciprocally in said cylinder from end to end by fluid flow from said upstream section, an inter-acting series of electrical circuits to actuate said valve operating means alternately and successively, the improvement which comprises a switch mechanism at each end of said cylinder including a reciprocal switch operating probe extending axially into said cylinder for pressure engagement by said piston at the end of each full stroke thereof, and an electrical shock absorber spring disposed internally of said cylinder at each end thereof, co-axially with said probe and cylinder and extended inwardly of the cylinder beyond the inner end of said probe, each of said shock absorber springs being connected in said electrical circuits as a ground connection between one of said switches and said cylinder, and wherein said piston, at each end of its reciprocal stroke, engages one of said springs immediately prior to engagement with the probe with which said spring is associated.

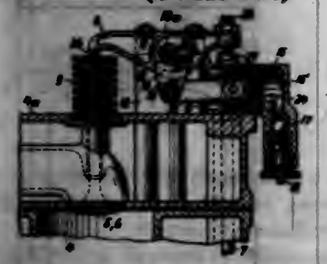
---

2,772,665
WATER COOLED FURNACE STRUCTURES
Oscar M. Fox, Pittsburgh, Pa., assignor, by mesne assignments, to Blaw-Knox Company, Pittsburgh, Pa., a corporation of Delaware
Application March 19, 1949, Serial No. 82,463
9 Claims. (Cl. 122—498)

3. A hollow water cooled furnace part having inlet and outlet openings, comprising a body portion, a hollow offset margin portion, a water manifold connected with the inlet opening, oppositely projecting nozzles on said manifold introducing water into the offset portion at a pressure differential with respect to the water in the body portion, partitions in the body portion directing the flow of water, said partitions and nozzles being spaced relative to one another to create an aspiratory action whereby the water is caused to flow between the body portion and the marginal portion and outlet means for carrying water out of the part.

---

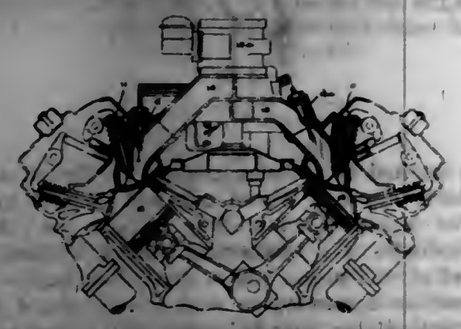
2,772,666
INTERNAL COMBUSTION ENGINE
Anthony V. Zapf, Bronx, N. Y.
Application April 12, 1955, Serial No. 500,867
1 Claim. (Cl. 123—74)



In an internal combustion engine, a cylinder, a piston rod slidably disposed within one end of said cylinder, means for supplying combustible gases to the other end of said cylinder, a frusto-conical portion secured to the inner end of said piston rod, a depending hollow, cylindrical portion connected to said frusto-conical portion and slidable within said cylinder, said cylinder having a bypass port extending from the combustion chamber to the center of the cylinder, said frusto-conical portion

and cylindrical portion having an air port bore extending therethrough and connecting the interior thereof with said bypass port at the end of the piston stroke, said cylinder having a plurality of exhaust openings in the side wall thereof adapted to be opened upon the movement of said piston rod to the extreme end of its stroke after the explosion whereby to relieve the pressure in the combustion chamber, said cylinder having an air intake opening below said bypass port adapted to be opened when the piston is in the other extreme position just prior to the explosion whereby to fill the other end of the cylinder with air under vacuum action.

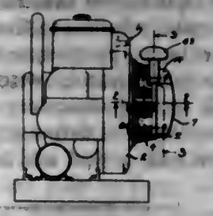
---



2,772,667
VALVE-CONTROL
Friedrich K. H. Nallinger, Stuttgart, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany
Application May 15, 1951, Serial No. 226,351
In Germany January 13, 1950
Public Law 619, August 23, 1954
Patent expires January 13, 1970
10 Claims. (Cl. 123—90)

1. Valve control for machines comprising a valve, a push rod, a rocking lever for transmitting the control motion from said push rod to said valve, means for supporting said rocking lever including an eccentric member, a lever connected with said eccentric member, a piston member connected with said lever, a rigidly arranged cylinder for said piston member, said piston member performing a forward and backward movement in said cylinder, a pressure means having a pressure medium, duct means from said pressure means to one side of said piston member for urging said piston member and said eccentric member by said pressure medium in the direction of compensation of play occurring in the direction of movement of said rocking lever, and means located on the other side of said piston for constantly urging said piston in the direction from the other side toward said one side.

---



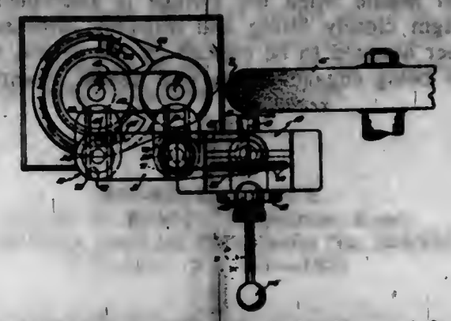
2,772,668
FUEL INJECTION SYSTEM
Carl H. Nystrom, West Springfield, Edward M. Bach, Longmeadow, and Arthur E. Huse, Springfield, Mass., assignors to American Bosch Arma Corporation, a corporation of New York
Application February 17, 1954, Serial No. 410,906
6 Claims. (Cl. 123—140)

1. In a device of the character described, a housing having a bore comprising spaced bore sections and a sump intermediate said bore sections, a fuel pumping and distributing member mounted for rotation and reciprocation in said bore, a plurality of outlets communicating with said bore, a face cam operatively connected to said pumping and distributing member adjacent an end thereof for effecting movement of said member in one direction, means for effecting the return stroke of said member, said member having a hollow portion adjacent the end thereof opposite said face cam and a distributing port communicating with said hollow portion of said member, said distributing port being adapted to communicate with each of said outlets successively upon rotation of said member, said member also having fill and metering ports communicating with said hollow portion of said member and with said sump and an adjustable sleeve in said sump and surrounding said member adjacent said metering port for controlling the passage of fuel through said metering port and means whereby said member may be rotated for effecting simultaneous rotation and reciprocation thereof.

---

2,772,669
ENGINE PULL STARTER
Werner E. Armstrong, Milwaukee, Wis., assignor, by mesne assignments, to Fairbanks, Morse & Co., Chicago, Ill., a corporation of Illinois
Application September 8, 1953, Serial No. 378,765
10 Claims. (Cl. 123—185)

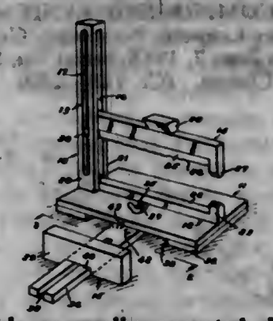
1. In a pull starter the combination comprising a circular shell attachable to the crankshaft of an engine to be started, a stationary mounting including a stationary pivot in alignment with said shell, a spring-retrieved wrapped-cord pulley rotatably mounted on said pivot, a clutch support secured to said pulley and extending into said shell having at least one clutch shoe seat, a clutch shoe received on and normally urged toward said seat having a contacting trailing end and a contacting leading end adapted to be shifted outwardly into contact with the interior surface of said shell, means activated by rotation of said pulley in the cranking direction cooperatively engaging said shoe to force the contacting ends of the same outwardly into contact with said shell, the contacting portions of the trailing end of said shoe being small in area to impose a high contacting stress per unit of area sufficient to penetrate any lubricant film accidentally adhering to the interior surface of said shell without substantial permanent deformation of said shell.



---

2,772,670
GRINDING WHEEL TRUING MECHANISM
Charles H. Jones, Jr., Lunenburg, Mass., assignor to Gould Engineering and Sales Co., Inc., Leominster, Mass., a corporation of Massachusetts
Application April 19, 1954, Serial No. 423,984
10 Claims. (Cl. 125—11)

1. Grinding wheel truing mechanism including a truing tool, indexing means for the tool comprising a first and a second element, said tool being supported in one of said elements, said elements being adjacent and relatively movable in a predetermined path, a rotatable member seated in said second element adjacent said first element, a spring urging said rotatable member to turn, a track in said first element corresponding to said path, said rotatable member having a raised portion slidably engaging said track, said track having a widened portion including co-

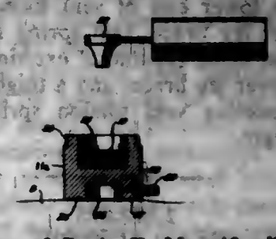


operating faces angularly disposed to said track which are offset from each other thereby allowing said rotatable member to turn within limits when its said raised portion enters said widened track portion during relative move-

ment of said elements, said angularly disposed faces engaging said raised portion against the force of said spring when the rotatable member is in said turned position thereby causing said rotatable member to resist further relative movement of said elements.

---

2,772,671
MASON'S BRICK CUTTER
James E. Nowak, Detroit, and Herbert Bischoff, East Detroit, Mich.
Application March 28, 1955, Serial No. 497,124
5 Claims. (Cl. 125—23)



1. A portable manually operated device for cutting bricks and the like comprising a base, a fixed elongated blade rigidly secured to said base, said fixed blade extending vertically upwardly from said base and having an upper cutting edge, a movable elongated blade directly above said fixed blade and having a lower cutting edge opposed to the upper cutting edge of said fixed blade, means mounting said movable blade for sliding movement and for swinging movement about one end thereof relative to said fixed blade in a vertical plane including said fixed blade, said mounting means including a guide fixed to said base at one end of said fixed blade and extending vertically upwardly from said base, means connecting said one end of said movable blade to said guide for vertical sliding movement along said guide and for swinging movement in a vertical plane to permit the insertion of a brick or the like to be cut into the space between said blades by movement of the brick in a lengthwise direction relative to said blades between the swinging end of said movable blade and the corresponding end of said fixed blade when said movable blade is moved upwardly by sliding and swinging sufficiently to permit such insertion.

---

2,772,672
MEANS AND METHODS FOR EXAMINING THE NATURE OF CARDIAC ACTIVITY
Samuel Lesser, Brooklyn, N. Y., assignor to Jewish Sanitarium and Hospital for Chronic Diseases, Kings County, N. Y., a corporation of New York
Application March 30, 1953, Serial No. 345,555
7 Claims. (Cl. 128—2.05)

1. A combination for studying cardiac impulses including a container substantially of cylindrical shape of about two inches in height and two inches in diameter and provided with a cavity about one inch deep and one and one half inches in diameter, the container weighing between eight and ten ounces; a dark liquid

having a viscosity of S. A. E. No. 40 oil in the cavity and about half filling same, and a lighted otoscope above the level of the liquid for shining a light onto the surface of the liquid and for observing the reflection of the light from the surface.

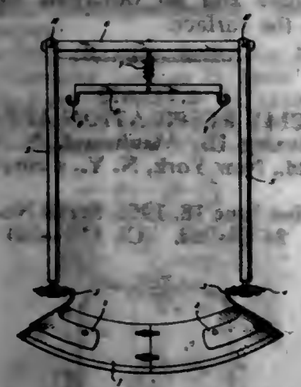
---

2,772,673
ARTIFICIAL RESPIRATION APPARATUS
Thomas C. Huxley III, Manhasset, N. Y., assignor to Coniloch, Ltd., New York, N. Y., a corporation of New York
Application June 18, 1952, Serial No. 294,163
26 Claims. (Cl. 128—30)

1. Apparatus for producing artificial respiration comprising a casing adapted to fit over and enclose at least the frontal portion of the patient's abdominal region, said casing having a suction duct in communication with the interior thereof, means for supporting said casing at its lower end whereby to relieve the patient of the full weight of the apparatus, means for sealing said casing to the patient's frontal portion at the marginal edges of the former, and means at the lower end of said casing to automatically adjust the width thereof to the patient, said last mentioned means comprising a resilient member associated with a side portion of said casing and said sealing means, said member being in operative relation with said sealing means and adapted to resiliently urge adjacent portions thereof laterally inwardly whereby to lightly clamp said sealing means to associated portions of the patient's body when said apparatus is fitted to the patient's body.

---

2,772,674
ORTHOPEDIC TORSION LEG BRACE
Edward Swiech and Vesuna A. Swiech, Seattle, Wash.
Application November 25, 1953, Serial No. 394,312
6 Claims. (Cl. 128—80)



4. In a torsion leg brace, a waist encircling pelvic band; a calf engaging leg band; a lower leg brace having its

upper end connected with said calf engaging leg band and having shoe engaging means at its lower end; torsion spring means; devices connecting the upper end of said torsion spring means with said pelvis band; other devices connecting the lower end of said torsion spring means with said lower leg brace, said spring means when torsionally stressed being capable of exerting a constant torsion on said lower leg brace; and a thigh encircling band rotatively supporting said torsion spring means intermediate its length.

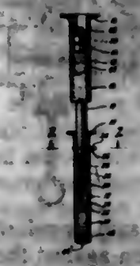
---

2,772,675
**HEAD SUPPORT**
Benjamin F. Simmons, Lake Charles, La.
Application July 2, 1954, Serial No. 443,498
9 Claims. (Cl. 128—87)

1. A neck traction device comprising a base shoulder rest, a head bridging structure having a pair of spaced uprights and means interconnecting their upper ends to accommodate their tilting adjustment one relative to the other, means attached to the upper portion of said head bridging structure for yieldably suspending a head harness and pivotal connection means between the head bridging structure and said base shoulder rest, accommodating limited universal swivel movement therebetween and including interengaging abutment stops precluding rotation of said uprights about their longitudinal axes.

---

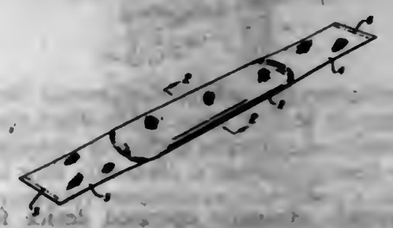
2,772,676
**CONNECTING DEVICE FOR BONE FRACTURES IN THE NEIGHBORHOOD OF JOINTS**
Ernst Pohl, Kiel, Germany
Application December 4, 1952, Serial No. 323,970
Claims priority, application Germany December 6, 1951
11 Claims. (Cl. 128—92)



1. Connecting device for fractures in the neighborhood of joints, more particularly for femoral neck and subtrochanteric fractures, consisting of two connecting elements to be separately driven through the femoral neck into the femoral head, said elements being loosely coupled at their outer ends to allow a relative longitudinal movement.

---

2,772,677
**SYRINGE ASSEMBLY**
Izaak A. Ulert, Walter J. Haldas, and Walter J. Larke, Houston, Tex.
Application February 18, 1953, Serial No. 337,466
8 Claims. (Cl. 128—215)



8. A hypodermic syringe assembly comprising, in combination, a syringe including a barrel, a plunger movable in the barrel, a projecting head member on the barrel, and an injection needle extending from the head member; and a container releasably and movably connected to said syringe and movably receiving said head member and needle when the syringe is assembled, and a diaphragm closely fitting and movably disposed in the container adapted to be pierced by the needle, said diaphragm being engageable by said needle, inward move-

ment of the needle in the container serving to effect engagement of the needle with the diaphragm and to pierce and move the diaphragm inwardly thereby forcing liquid in the container through the needle and into the barrel into contact with medicament therein; and means on the plunger and container for connecting the container to the plunger whereby upon connection thereof the container serves as a handle for the plunger.

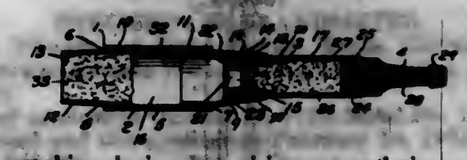
---

2,772,678
**FOLDED AND COMPRESSED SANITARY NAPKIN**
Curt Walter Leupold, Nurnberg, Germany
Application June 7, 1955, Serial No. 513,656
7 Claims. (Cl. 128—290)

1. Folded and compressed sanitary napkin, folded upon itself approximately midway between its ends, rolled up and then compressed, the end margins being placed one a little after the other, said end margins being free from attachment to each other along their lateral edges, whereby unfolding of the napkin by separation of one of the end margins from the other is facilitated.

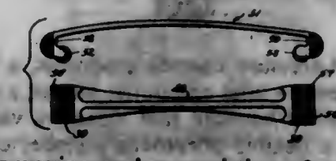
---

2,772,679
**OPTICAL PHOTOLUMINESCENT INDICATING DEVICE FOR HIGH FREQUENCY THERAPEUTIC TREATMENT CIRCUIT**
Arnulf Grabbert, Wiesbaden, Germany
Application July 11, 1952, Serial No. 298,322
2 Claims. (Cl. 128—421)



1. In combination with an electro-therapeutic short wave apparatus; a casing, perforated covering means on said casing, an output circuit, an indicating device comprising a luminescent element including a transparent carrier which is at least partly coated on its inner side with a luminescent material, holder means for said element including a pair of clamps each having a flat lower face, a slotted pin in said flat face, a knurled screw adapted to fasten the clamp on the element, whereby the element can be secured to the casing of the apparatus by plugging said slotted pins into any of the perforations, and means for coupling said element with said output circuit in such a way that the state of tuning and the output of said circuit are optically indicated by the length of the luminous column and the intensity thereof, respectively.

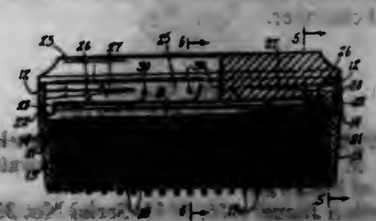
---



2,772,680
**SMOKING DEVICE**
George W. Rohfeld, Manhattan, Kans.
Application April 26, 1952, Serial No. 284,537
2 Claims. (Cl. 131—182)

2. A smoking device comprising a mouthpiece, a stem, and a tobacco receptacle all interconnected in axial alignment with the tobacco receptacle having an annular wall provided with a tapered portion at one end engaging a tapered end on the stem and said receptacle having an open opposite end through which tobacco is inserted into the tobacco receptacle, said stem having a filter chamber therein for containing a filtering material and said tapered end having a smoke passageway of smaller diameter than the filter chamber for communicating the filter chamber with the tobacco receptacle, said stem being reciprocable within the receptacle and the tapered portion of said stem having an annular tamping face encircling the smoke passageway and a surrounding annular lip engaging the wall of the receptacle to dislodge burnt tobacco from the receptacle and to pack tobacco within the open end portion of the receptacle upon reciprocation of the stem to and from a position with the tapered portion of the stem engaging the tapered portion of the receptacle, said mouthpiece having an end removable from the end of the stem opposite the tapered end thereof to permit the insertion of filtering material into the filter chamber and replaceable to retain the filtering material, the mouthpiece having a bit portion of slightly greater width than the tapered portion of the receptacle adapted to cooperate with the tapered end of the stem in retaining the stem in connection with the receptacle, and said tapered portion of the receptacle being yieldable to permit removal of the stem.

---

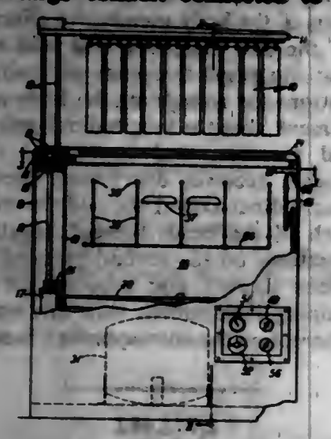


2,772,681
**APPARATUS FOR WAVING HAIR**
James A. Swenson, Waltham, William E. Burns, Norfolk, and Richard H. Sloan, Revere, Mass.
Application June 27, 1951, Serial No. 233,818, now Patent No. 2,648,340, dated August 11, 1953, which is a division of application Serial No. 117,597, September 24, 1949, now Patent No. 2,584,760, dated February 5, 1952. Divided and this application March 12, 1953, Serial No. 341,904
3 Claims. (Cl. 132—40)

1. A hair-waving curler consisting of a main or body member of elongated form and a wholly structurally separate cooperating second member, also of elongated form for positioning in generally parallel laterally spaced relation on and along the body member in end engagement therewith, said body member having at each end an enlarged head with a longitudinal outwardly open socket, and the cooperating second member having opposed reversely inwardly directed rounded knobs receivable in the head sockets of the body member to effect said mutual positioning of the two members, and said two members each having at the respective ends mutually cooperable holding formations for restraining the body member from rotative movement about a longitudinal axis and relative to the second member, said formations comprising a series of elongate recesses distributed circumferentially about such longitudinal axis of the body member upon the surface of each of the heads thereof, together with jutting edge formations on the second member adjacent the respective knobs thereof and adapted for interlocking rotation-restraining engagement with any opposite recess of the series thereof on the corresponding head of the body member.

---

2,772,682
**COMB**
Walter Pfaeger and Henry Angenstein, Newark, N. J.
Application July 18, 1955, Serial No. 522,739
2 Claims. (Cl. 132—135)



1. A comb comprising a fixed comb section and a removable and swingable comb section, said fixed comb section having a hollow body portion open at the top and with spaced openings in the bottom, integral spaced teeth depending from the bottom of said body portion, said removable and swingable body section including a shaft rotatably mounted in the bottom of said hollow body portion, and integral teeth on said shaft extending through the openings in the bottom of the body portion and disposed between the teeth on the hollow body portion, and a back portion seated on said hollow body portion, and means carried by said back portion and body portion for interlocking the comb sections and back portion, said interlocking means including spring fingers on the back portion engageable with the shaft of the swingable section, and complementary and coacting protuberances and depressions on the back portion and body portion, respectively.

---

2,772,683
**MASK-CLEANING MACHINE**
Harry Szczepanski, Grand Rapids, Mich.
Application July 18, 1952, Serial No. 299,540
4 Claims. (Cl. 134—44)

1. A mask-cleaning machine, comprising: means forming a spray chamber; rack means for supporting masks in said spray chamber; spray means disposed within said chamber to direct spray at masks supported by said rack means; a solvent container disposed below said chamber; drain means connecting the bottom of said chamber with said container, said drain means including a one-way valve preventing flow from said container; condult means connecting said container with said spray means to supply solvent thereto; air-pressure supply means including control means and adapted to apply pressure to said container to induce flow of solvent to said spray means, said air-pressure supply means including air release valve means, timing means actuating said air release valve means to exhaust the air pressure from said container on completion of a solvent-spraying action; and purging means in-

cluding selector valve means in the conduit means connecting said container with said spray means and adapted to divert flow therefrom, said purging means including an extensible discharge conduit connected to said selector

valve means, the end of said discharge conduit being normally disposed within said spray chamber for discharge thereinto and extendable therefrom for discharge externally of said chamber.

---

2,772,684
ADJUSTABLE CANOPY
Alfred E. Puls and Donald R. Hoag, Cleveland, Ohio, assignors to Robco-Tonda License Corporation, a corporation of Delaware
Application January 26, 1953, Serial No. 333,044
3 Claims. (Cl. 135—5)

1. A canopy comprising a curved support having a slot in the curved portion thereof, a bolt extending through said slot and having a head operatively engaging said support, a plurality of canopy support arms pivotally carried by said bolt on a side of said support space from the bolt head, a lock nut in threaded engagement with said bolt intermediate said support and the said support arms and spaced from said support, spring means compressed intermediate said support and said support arms by engaging said lock nut, and lock nut means on said bolt for pressing said support arms against said lock nut to secure said support arms in position whereby the assembly of said bolt and support arms can be slid along in said slot when additional compressive pressure is exerted on said spring means and said bolt head is released from engaging said support.

---

2,772,685
TELESCOPIC POCKET UMBRELLA
Benno Leo Koch, Geneva, Switzerland
Application September 22, 1953, Serial No. 381,546
Claims priority, application Switzerland October 25, 1952
1 Claim. (Cl. 135—26)

A telescopic pocket umbrella comprising a central rod having upper and lower ends, a rosette on the upper end of said central rod, said rosette being provided with a plurality of recesses, a plurality of supporting rods having upper and lower ends, the upper ends of said supporting rods being hook-shaped and seating in said recesses of said rosette, respectively, ring means hingedly connecting said hook-shaped ends of said supporting rods to said rosette for pivotal movement of said supporting rods with respect to said central rod, said central rod and said supporting rods including a plurality of tubular rod sections of stepped diameters telescopically displaceable within each other, respectively, each of said rod sections including stop means for maintaining said rods in extended position, said stop means comprising a conical head including a projecting edge at one end of each of said rod sections, respectively, and two oppositely directed inwardly bent tongues at the other end of each of said rod sections, respectively, said tongues defining a slot therebetween, said head of each of said rod sections extending into the adjacent rod section for cooperation with the slot of said adjacent rod section,

sleeve means on one of the rod sections of said central rod, said sleeve means being displaceable upwardly along said one rod section in moving from closed to open position of said umbrella, a plurality of rod members hingedly connecting said sleeve means with said supporting rods, respectively, and flange means provided with an upright rim and carried on said lower end of said central rod, the lower ends of said supporting rods, respectively, being secured in said rim of said flange means in closed position of said umbrella, whereby upon telescopically extending said central rod said supporting rods are simultaneously extended, upward movement of said sleeve means then effecting pivotal displacement of said supporting rods to open said umbrella.

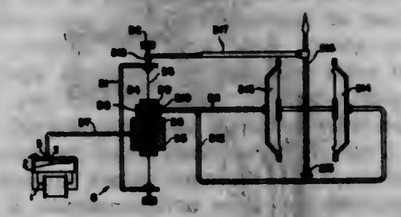
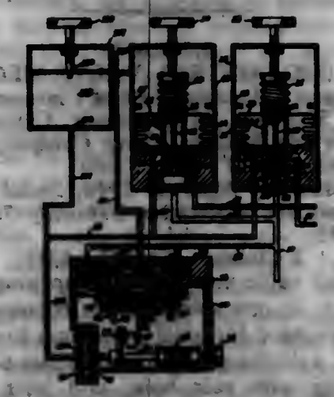
2,772,686
VALVE MECHANISM
Irving R. Versay, New Haven, and Frederic D. Meller, Orange, Conn., assignors to The Berger Brothers Company, New Haven, Conn., a corporation of Connecticut
Application November 28, 1952, Serial No. 322,864
2 Claims. (Cl. 137—39)



1. In a fluid-pressure control apparatus, a casing having positive pressure inlet and outlet means, a port affording communication between said means, a valve controlling said port, a flexible pneumatic member connected to said valve and biased to urge the valve to closed position, means normally subjecting both sides of said member to the fluid pressure in said inlet means to hold the valve in closed position, means controlled by the action of centrifugal force to vent to the atmosphere the fluid pressure

on one side of said member and effect the opening of the valve, said last-named means comprising a vent port leading from said one side of said member, a weighted valve member moved by centrifugal force to control said port, and a spring acting against the weight of said weighted valve member to bias the valve member toward closed position, a second flexible member, exposed on one side thereof, to the pressure in said outlet means and on the other side to atmospheric pressure, said second flexible member being connected to said first valve to urge it toward closed position when subjected to the pressure in said outlet means after said first valve is opened under the influence of said first flexible member.

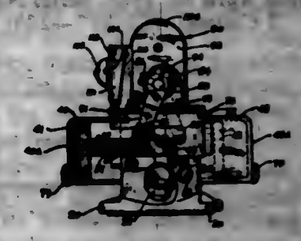
---



2,772,687
PRECISION GALVANOMETER
Guido Wilnsch and Horst Ziegler, Berlin, Germany, assignors to Askania-Werke, A. G., a corporation of Germany
Original application October 19, 1950, Serial No. 191,958. Divided and this application February 24, 1953, Serial No. 340,000
Claims priority, application Germany (U. S. Zone) October 29, 1949
7 Claims. (Cl. 137—83)

1. In a galvanometer having a coil deflectable relative to a field and about a vertical axis by a small electromagnetic torque, a deflection measuring device comprising wall means secured to the coil to form a hollow body deflectable with the coil; a vertically facing air inlet port, intersected by said axis, in said wall means; a laterally facing air outlet port, located laterally of said axis, in said wall means; jet supply means adapted to direct a vertical air flow along said axis and into the inlet port; and laterally facing jet relay received nozzle means opposite the air outlet port.

---



2,772,688
PNEUMATIC CYCLE TIMER
Peter R. Brock, Hagerstown, Md., and Alexander v. d. Luft and William F. Schmeckebier, Martinsburg, W. Va., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application September 13, 1954, Serial No. 455,452
4 Claims. (Cl. 137—102)

1. A pneumatic cycle timer comprising in combination a gas pressure source, at least one pair of pneumatic relays each having service gas inlets in communication with said gas pressure source and service gas outlets each in communication with at least one individual signal line, a cycling relay having a chamber provided with a valved port in communication with said gas pressure source and a second valved port venting to atmosphere, said cycling relay being further provided with gas pressure-actuated means for opening and closing said valved ports in alternation upon the application of preselected pressures to said pressure-actuated means, a gas storage reservoir provided with two gas storage chambers, a throttling valve connecting said two gas storage chambers, gas passage means connecting said chamber in said cycling relay with one of said gas storage chambers, and other gas passage means connecting the other of said gas storage chambers in operative relationship with said pressure-actuated means and with the actuating means of said pneumatic relays.

---

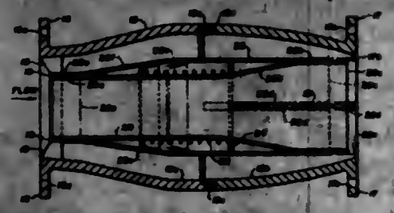
2,772,689
MILKING MACHINE TIMING DEVICE
Theodore Asti, Milwaukee, Wis.
Application January 22, 1952, Serial No. 267,570
14 Claims. (Cl. 137—103)

1. A vacuum-actuated milking device adapted to pulse vacuum alternately to one and then another conduit and comprising in combination, a motor cyclically shiftable by vacuum from one limit position to another and then back, a valve operated by and under control of the motor, the valve having one setting corresponding to the said one limit position of the motor whereat vacuum is adapted to be pulsed to the one conduit and having another valve setting corresponding to the said other limit position of the motor whereat vacuum is adapted to be pulsed to the other conduit, the valve having an intermediate position corresponding to an intermediate position of the motor whereat both conduits are closed to atmosphere to maintain vacuum in the lines, counting means arranged in said device and adapted to count the cyclic movements of the motor, means cyclically shiftable between limit positions with the motor for moving the counting means one unit for each cyclic movement of the motor, said last-named means having an intermediate position determinative of the said intermediate position of the motor, and means for locking the counting means at a predetermined number to maintain the means cyclically shiftable with the motor and the valve at the said intermediate positions thereof.

---

2,772,690
BLEEDER VALVE
Jean Mercier and Jacques H. Mercier, New York, N. Y.
Continuation of abandoned application Serial No. 648,711, February 19, 1946. This application March 31, 1953, Serial No. 345,986
16 Claims. (Cl. 137—119)

1. A bleeder valve comprising a casing having an inlet port, an outlet port and a bleeder port, a main valve controlling flow from said inlet port to said outlet port, resilient means normally retaining said main valve in closed position, an auxiliary valve controlling flow from said inlet port to said bleeder port, means normally urging said auxiliary valve to closed position, means operatively connecting said two valves and retaining said auxiliary valve in open position when said main valve is closed, and means associated with said main valve when said main valve is



open, upon liquid flow to produce suction by venturi effect to overbalance the resilient means normally retaining the main valve in closed position, whereby when the

liquid flow rate falls below a predetermined amount required to overbalance the resilient means, said main valve will close to open said auxiliary valve for bleeding of liquid and gas through said bleeder port.

---

2,772,691
FLUID FLOW REGULATOR
James David Hoffman, Pacific Palisades, Calif., assignor to North American Aviation, Inc.
Application April 22, 1953, Serial No. 350,473
2 Claims. (Cl. 137—220)

1. In a flow regulating device, a body member having inlet and outlet portions and an intermediate wall portion, support means disposed across said body inlet, support means disposed across said body outlet, an inner tubular element fixedly supported by said inlet and said outlet support means, an outer tubular element slidingly mounted upon said inner tubular element and having a tapered portion intermediate its ends merging in a portion of enlarged cross-section greater than that of the adjacent portion of the inner tubular element thereby forming a hollow space between the said inner and outer tubular elements, said tubular elements arranged to permit fluid flow through said inner element and outside of said outer element whereby increased flow rates of a predetermined magnitude cause axial movement of said outer tubular element to cause a portion thereof to assume a position adjacent said outlet to restrict said outer fluid flow and confine the fluid flow to a substantially predetermined rate through said inner tubular element, and resilient means disposed within the hollow space between said tubular elements in the vicinity of the tapered portion of said outer tubular element to oppose said axial movement of said outer tubular element.

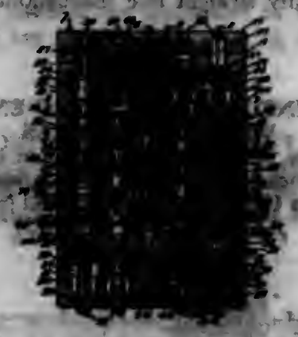
---

2,772,692
INFLATION VALVE WITH MANUAL OPERATOR
Lloyd E. Russell, Springfield, Ohio, assignor to Peters & Russell, Inc., Springfield, Ohio, a corporation of Ohio
Application March 5, 1953, Serial No. 340,490
12 Claims. (Cl. 137—223)

1. An inflator or like valve, including a cylindrical bushing presenting at its one end a valve seat and in inwardly spaced relation to said valve seat internal screw threads, a hollow adjustment member received in said bushing with external screw threads and having one end projecting through and beyond the other end of said bushing for manual rotation, said one end of the adjustment member being internally adapted to receive an air hose or the like, the other end of said adjustment member being formed with projecting fingers, and a valve element supported by said fingers for relative rotary motion and engageable and disengageable with respect to said valve seat under control of said adjustment member.

---

2,772,693
DOUBLE ACTING VALVE
Arthur H. Bolleen and Charles J. Rayman, Cedar Rapids, Iowa, and Francis S. Beard, Chicago, Ill., assignors to Cherry-Burrell Corporation, Wilmington, Del., a corporation
Original application October 22, 1948, Serial No. 56,022, now Patent No. 2,665,628, dated January 12, 1954. Divided and this application April 3, 1952, Serial No. 281,113
3 Claims. (Cl. 137—512.3)

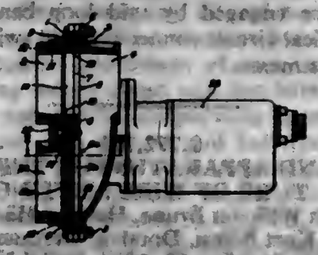


1. In a double acting valve of the class described the combination of a valve body having an inlet chamber with an inlet port at one end thereof, an outlet chamber having a lateral outlet port, said outlet chamber being disposed at an angle with respect to said inlet chamber and communicating therewith remote from said inlet port, and a piston valve in each of said chambers, said inlet chamber being provided with a groove extending from adjacent the inlet port toward said outlet chamber, the piston valve in said inlet chamber being weight biased toward said inlet port and retractable to permit bypass through said groove, and said outlet chamber being provided with a seat between the inlet chamber and the outlet port, the piston valve in said outlet chamber being resiliently biased toward said seat and retractable under pressure therefrom to permit flow therepast.

---

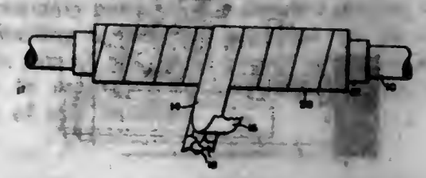
2,772,694
HYDRAULIC CONTROL VALVE MECHANISM
Leon E. Simmons, deceased, late of Claremont, N. H., by Gladys L. Simmons, administratrix, Claremont, N. H., assignor to Joy Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Original application April 1, 1946, Serial No. 18,465. Divided and this application February 7, 1951, Serial No. 209,745
2 Claims. (Cl. 137—621)

1. A control valve mechanism comprising a valve box having a bore, an operator shiftable balanced spool type slide valve arranged for axial movement in said bore, an inlet passage, a discharge chamber, bypass passage means communicating with said bore, said inlet passage and said discharge chamber and through which liquid freely flows when said valve is in neutral position from said inlet passage to said discharge chamber, said valve having passage means between certain of the spools thereof for permitting such flow when said valve is in neutral position and said valve cutting off such flow when it is moved out of neutral position, a transverse pressure passage communicating with said bore, and a spring loaded pilot valve normally cutting off communication of said pressure passage with said inlet passage when said slide valve is in neutral position and said bypass passage means is open, said pilot valve having a pressure area subjected to liquid under pressure in said inlet passage and passage means openable, due to the building



up of pressure in said inlet passage when said slide valve is moved out of neutral position as aforesaid, to effect liquid flow from said inlet passage to said transverse pressure passage, said pilot valve having spring means for opposing movement of said pilot valve toward open position, and loading means for said spring means set to exert different pressures, said pilot valve moving under the influence of liquid under pressure into a position so that its passage means connects said transverse pressure passage in communication with said discharge chamber whenever the pressure in the system becomes excessive.

---

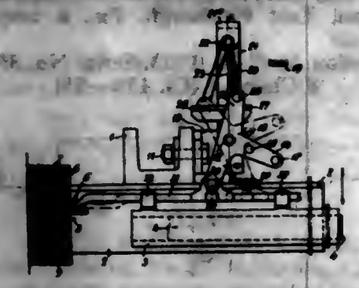


2,772,695
MIXING VALVES
Walter Mostyn Harrison, Cefn Coed, near Merthyr Tydfil, South Wales, assignor to Teddington Aircraft Controls Limited, Cefn Coed, Wales
Application March 1, 1952, Serial No. 274,411
Claims priority, application Great Britain March 20, 1951
1 Claim. (Cl. 137—625.4)

In valve structure for effecting a controlled admixture of fluids, housing structure defining two side-by-side fluid inlets and an outlet common to said inlets, said housing also including a common manifold chamber to which said outlet delivers fluid delivered from said inlets, said housing including internal recesses, slotted grid structure, means fixedly mounting said grid structure in said housing to form a partition between said inlets and said outlet, said housing recesses being located on one side of said partition, a pair of slotted gates of self-lubricating material, means mounting said gates for rectilinear guided motion in said housing recesses with the gates located against one side of said partition, actuator means for gates including frames embracing said gates for effecting simultaneous sliding movement thereof in opposite directions, said frames having extension portions having slots defined therein, driver means disposed in said slots for actuating said frames and gates, rotatable driven means upon which said drivers are eccentrically mounted for simultaneously actuating said frames and gates with sliding movement in opposite directions, said housing having internal pockets located adjacent said recesses, said gates having edge portions guided in said recesses and springs in said pockets acting against said edge portions for sealing said gates against said grid.

---

2,772,696
FLEXIBLE RESIN BONDED MICA MEMBERS
William Schneider, Pittsburgh, Pa., and Aubrey W. Worthington, Irving, Tex., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application April 21, 1953, Serial No. 350,034
8 Claims. (Cl. 138—55)



1. A flexible tube comprising a plurality of layers of helically wrapped mica tape, the tape comprising a sheet backing and mica flakes disposed thereon, and a thermosettable resinous binder impregnating the spaces and interstices between the layers of mica tape and between the mica flakes, the resinous binder composed of a partly cured composition comprising essentially from 30% to 60% by weight of a liquid vinyl aryl monomer and from 70% to 40% by weight of an unsaturated polyester of an ethylenic dicarboxylic acid and a polyhydric alcohol dissolved therein, the composition being heat-treated for a sufficient period of time and at a temperature to produce a partly cured resin having a flexibility corresponding substantially to that secured by heating for a period of from 3 to 4 hours at 135° C. a composition composed of 50% by weight of monostyrene and 50% by weight of a polyester of a viscosity of 1,000 poises at 25° C. prepared from 44 mole percent of adipic acid, 6 mole percent of fumaric acid and 50 mole percent of propylene glycol catalyzed with 0.5 percent by weight of tert-butyl peroxide.

7. In the process of preparing flexible mica tubing from mica flakes and a thermosettable resinous impregnant, the steps comprising applying to the surface of a mandrel a layer of parting material, wrapping on the treated surface of the mandrel a plurality of layers of sheet mica material, the sheet mica material comprising a sheet backing and a layer of mica flakes disposed on the sheet backing, and a liquid resinous binder applied to unite the mica flakes and sheet backing, the resinous binder having a viscosity of from 25 to 10,000 poises at 25° C., impregnating the mica sheet wrapping on the mandrel with a liquid, completely reactive, thermosettable resinous composition, which is compatible and miscible with the liquid resinous binder, the liquid, completely reactive, thermosettable resinous composition comprising essentially from 30% to 60% by weight of a liquid vinyl aryl monomer and from 70% to 40% by weight of an unsaturated polyester of an ethylenic dicarboxylic acid and a polyhydric alcohol dissolved in the liquid vinyl aryl monomer, wrapping the impregnated mica layers with an impervious sheet material to prevent escape of the liquid impregnant, heat-treating the entire mandrel assembly at a temperature and for a period of time to partly cure the resinous impregnant to produce a partly cured resin having a flexibility corresponding substantially to that secured by heating for a period of from 3 to 4 hours at 135° C. a composition composed of 50% by weight of monostyrene and 50% by weight of a polyester of a viscosity of 1,000 poises at 25° C. prepared from 44 mole percent of adipic acid, 6 mole percent of fumaric acid and 50 mole percent of propylene

glycol catalyzed with 0.5 percent by weight of tert-butyl peroxide, removing the impervious sheet material and removing the resulting mica tube from the mandrel.

2,772,697
**SHUTTLELESS WEAVING LOOMS**
Raymond Dewas, Asnieres, France
Application August 4, 1953, Serial No. 372,283
Claims priority, application Great Britain August 6, 1952
6 Claims. (Cl. 139—35)

1. Means for controlling the warp threads in selvedges produced in a shuttleless weaving loom, comprising two stationary stops, an element mounted on the slay of the loom to slide into the shed and a spring urged toggle mechanism mounted on the slay and having projections that contact with said stationary stops as the slay moves to and fro initially to move the element positively until the toggle mechanism passes the point of unstable equilibrium when the full travel of the element is rapidly completed by the spring.

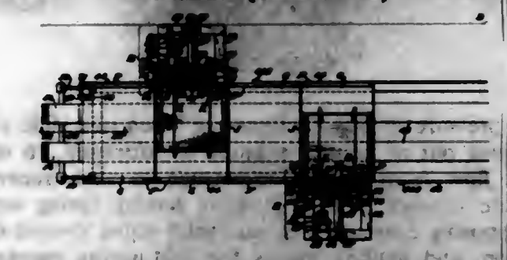
---

2,772,698
**REVERSIBLE WOVEN FLAT FABRICS**
William A. Linehan, Jr., Raleigh, N. C., assignor to Raico Fabric, Raleigh, N. C., a partnership of North Carolina composed of William A. Linehan, Jr., and William L. Steele
Application September 17, 1954, Serial No. 456,824
4 Claims. (Cl. 139—384)

1. A reversible woven flat fabric comprising a predominant portion of single thickness, a tubular portion of a plurality of thicknesses and extending in one of the longitudinal and transverse dimensions of said fabric, and a design woven into each of the outer thicknesses of said tubular portion.

---

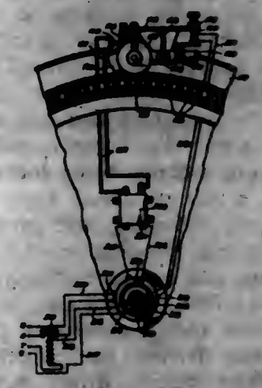
2,772,699
**WOVEN WEBS**
Thomas M. Scruggs, Richmond Heights, Mo., assignor to Bemis Bro. Bag Company, St. Louis, Mo., a corporation of Missouri
Application February 12, 1953, Serial No. 336,530
3 Claims. (Cl. 139—419)



1. A leno-woven open-mesh web having paired warp and single filler strands, and a warpwise reference line adjacent one edge of the web extending continuously throughout the length of the web and established by having one warp strand of a pair adjacent said one edge of the web of a distinctively contrasting appearance with respect to the remainder of the web, each portion of said distinctive warp strand which lies between adjacent filler strands, in the unstressed condition of the web, being out of sidewise contact with adjacent portions of said distinctive

warp strand, and said distinctive warp strand extending as a substantially straight line throughout the length of the web.

---

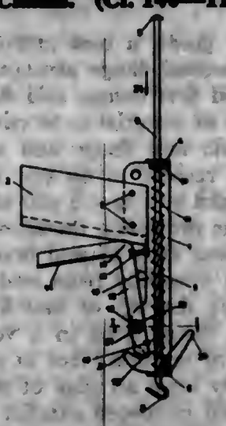


2,772,700
**MACHINE FOR ATTACHING ENDS TO WIREBOUND BOXES**
Richard L. Rice, Madison, N. J., assignor to Stapling Machines Co., Rockaway, N. J., a corporation of Delaware
Application October 20, 1951, Serial No. 252,261
3 Claims. (Cl. 140—93)

1. Apparatus for attaching the ends to wirebound box and crate blanks comprising a support for said blanks, a movably mounted clamp adapted to engage said blanks and hold them against movement on said support, movably mounted loop bending members adapted to engage wire loops projecting from said ends through openings in said blanks, a first motive means for moving said clamp into forcible engagement with said box blanks, a second motive means for driving said loop bending members to bend said loops around a part of said blanks to secure said ends to said blanks, a switch connected to control both said motive means, said switch being positioned to be actuated by certain parts of said blanks when said blanks reach the point where said loops are in position to be engaged by said loop bending members and an electrical circuit connecting said switch for control of said motive means.

---

2,772,701
**PROCESS AND APPARATUS FOR THE MANUFACTURE OF WIRE NETTING**
Heinrich Wilhelm Brune, Herbert Hildrich, and Kurt Bähre, Dorsten, Germany
Application October 12, 1951, Serial No. 251,008
Claims priority, application Germany May 29, 1951
5 Claims. (Cl. 140—112)

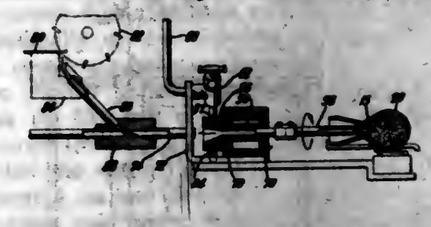


1. An apparatus for making wire netting including a revoluble wheel member having an annular fixed welding

plate connected to one side thereof, said plate being provided with circumferentially spaced recesses in the outer surface thereof, movable welding supports mounted in said recesses, an annular series of movable electrodes spaced outwardly from said supports, a guiding member positioned above said welding member, means for feeding spaced longitudinally disposed wires over said support and said guiding member, means for moving spaced transversely disposed wires externally over the longitudinal wires before the latter reaches the guiding member, and means for moving the electrodes to weld the transverse wires to the longitudinal wires at their points of intersection.

---

2,772,702
**BINDING INSTRUMENT**
Donat Guignard, Sainte-Croix, Switzerland
Application May 28, 1953, Serial No. 356,243
Claims priority, application Switzerland June 13, 1952
4 Claims. (Cl. 140—119)



1. A binding instrument comprising a body having two ends, a handle projecting from said body, first and second perforated lugs rigid with said ends of said body, respectively, a bar slidably carried in the perforations of said lugs, respectively, and having first and second terminals extending beyond said first and second lugs, respectively, hook means on said first terminal of said bar, pin means on said second terminal of said bar for limiting longitudinal movement of said bar in one direction, stop means on said bar intermediate said lugs for limiting longitudinal movement of said bar in opposite direction, spring means about said bar between said first lug and said stop means, cooperating formations on at least one of said lugs and on said bar, respectively, for causing rotation of said bar when longitudinally displaced relative to said lugs, bell crank means pivotally secured to said body, and lock means on said bell crank means, said bell crank means and said handle together forming a pistol grip for said instrument, whereby upon relative dsiplacement between said body and said bar to compress said spring means and to cause rotation of said bar with said hook means, actuation of said bell crank means brings about engagement of said stop means with said lock means so as to retain said bar and said body in relatively displaced position thereof, deactuation of said bell crank means thereafter effecting release of said lock means from said stop means and reverse rotation of said hook means with said bar upon return of the latter to its starting position under the action of said spring means.

---

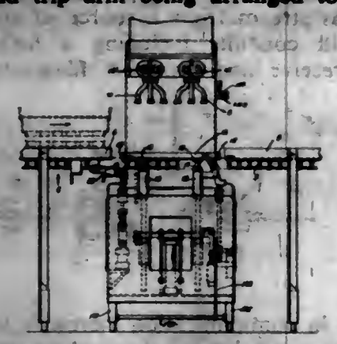
2,772,703
**METHOD AND APPARATUS FOR FILLING FLASHBULBS**
Sedgwick Rusling Bennett and Allen Mertz, Williamsport, Pa., assignors to Sylvania Electric Products Inc., a corporation of Massachusetts
Application October 26, 1950, Serial No. 192,224
15 Claims. (Cl. 141—1)

15. In an apparatus for use in introducing and arranging filamentary particles in a flashbulb envelope, means comprising conduits for transporting filamentary particles in a gas stream from a source of supply to said envelope, said conduits including a hollow member adapted to receive and transport filamentary particles

and a nozzle in communication therewith for projecting said filamentary particles in a directed stream, and means for supporting a flashbulb envelope on an axis offset from the axis of the discharge end of the nozzle and in position to receive said stream directly on the inside sidewall of said envelope.

---

2,772,704
**FLUID CONTAINER**
John N. McConnell, Evanston, and Harlan F. Boris, Chicago, Ill., assignors to American Hospital Supply Corporation, Evanston, Ill., a corporation of Illinois
Application August 21, 1952, Serial No. 305,654
5 Claims. (Cl. 141—24)

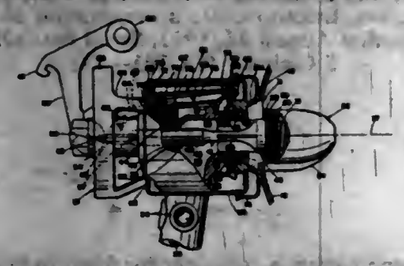


5. In combination, a container for fluids to be dispensed in drops and comprising a body portion, a neck portion providing an opening into the interior of the body portion, a cap removably mounted on said neck portion for closing the same, and a straight bore eye dropper mounted on said cap and extending into said container, one wall of said body portion having an inwardly directed shallow indentation adjacent the lower end of said one wall with the upper inner surface of the indentation forming the lower inner surface of an internal drop-receiving depression having an intermediate sump portion, said drop-receiving depression having the upper inner surface thereof positioned adjacent said neck portion and inclined from said sump portion gradually toward the oppositely disposed edge at the open end of the neck portion and at an angle such that the straight bore dropper is inclined from said oppositely disposed edge of the neck portion to lie substantially along the upper inner surface of said drop-receiving depression with the tip of the dropper projecting into the sump portion to pick up the last drop of fluid when the said drop-receiving depression is positioned lowermost with respect to the remainder of the said one wall of the body portion.

---

2,772,705
**MOLD FILLING MACHINE**
Ralph F. Anderson, Rockford, Ill.
Application August 13, 1951, Serial No. 241,588
30 Claims. (Cl. 141—167)

2. In a mechanism for filling receptacles carried on a conveyor, the combination of an elevating table positioned intermediate the ends of said conveyor to receive a receptacle from the conveyor, a trip arm interposed in the path of movement of the receptacle advancing onto the elevating table, and means operative in response to the engagement of said trip arm by the receptacle which has advanced onto the elevating table for raising the elevating table and said receptacle to the filling position and for lowering said table after the receptacle carried thereby



has been filled to discharge that receptacle back onto the conveyor, said trip arm being arranged to be engaged

by the receptacle as the latter is lowered and removed thereby out of the path of movement of the receptacle on the conveyor.

---

2,772,706
NOZZLE
Erik Petas, Los Angeles, Calif., assignor to Aerojet-General Corporation, Azusa, Calif., a corporation of Ohio
Application June 7, 1954, Serial No. 434,753
5 Claims. (Cl. 141—346)

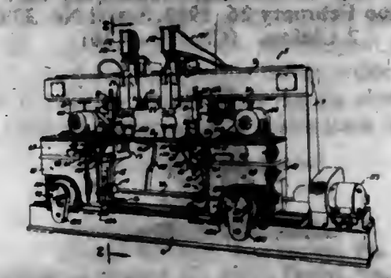
1. A nozzle and adapter combination for filling a tank with fluid from a conduit, said nozzle connecting with the conduit for control of flow therethrough, and said adapter being attachable to a tank so as normally to close a hole therein, comprising: an adapter comprising an adapter body having a central axis and a passage therethrough for permitting fluid flow from one side of the adapter to the other, a closure member for closing said passage, said closure normally closing said passage and being movably mounted so as to permit fluid flow through said passage, and hook engaging means so disposed and arranged so as to be outside the tank when the adapter is installed thereon; and a nozzle comprising a nozzle body having a central axis, an opening through a side thereof and an internal flow chamber interconnecting said conduit and said outlet, a poppet valve adapted to plug said outlet in one position and to open said outlet in another position, an actuator handle mounted on the nozzle, said poppet being slidable by movement of said handle, a cam plate rotatably mounted with respect to the nozzle body, and interlocking means pivotally mounted to said nozzle comprising a retention member having a hook portion adapted to grasp said hook engaging means and a locking member so disposed and arranged that in one position it prevents rotation of the cam plate in one direction by standing in the way of the cam plate, and in another position permits such rotation, said interlocking means being tiltable and spring loaded so that a portion of the interlocking means changes its distance from the central axis when the nozzle is connected and disconnected to and from the adapter, and latching means actuatable by said actuator handle pivotally mounted so as to be moved to prevent rotation of said cam plate in a first position of the handle and to permit rotation of the cam plate in a second position of said handle, said second position being possible only when the nozzle is closed; whereby pressing the nozzle against the adapter causes the retention members to engage the hook engagement means thereby holding the nozzle and adapter together, and the locking member to release the cam plate for rotation, whereby the handle can be turned to move the poppet and open the outlet in the nozzle body and also to open the adapter, and whereby the interlocking means prevent the detaching of the nozzle from the adapter when the poppet valve is open.

---

2,772,707
LENGTH AND SQUARE GUIDE FOR A POWER HAND SAW
Arnie E. Leino, Warrenville, Ill.
Application February 8, 1955, Serial No. 486,841
1 Claim. (Cl. 143—47)

In a power saw guide, a base embodying a horizontal first flange, a second flange arranged at right angles with respect to said first flange, said flanges adapted to engage a first piece of material to be cut, a bar extending outwardly from said first flange and arranged at a 90 degree angle with respect to an end thereof, said bar adapted to be engaged by a saw, a pair of hollow brackets on said base for the projection therethrough of a second piece of material and each of said brackets including a first arm extending upwardly from said first flange, said first flange engaging the top of said first piece of material, said second flange lying in a vertical plane and engaging the edge of the first piece of material, a finger extending outwardly from an edge of said first flange, a second arm arranged in spaced parallel relation with respect to said first arm and extending from said finger, a web extending between said first and second arms and arranged at right angles with respect to said arms, a securing element extending through each of the webs of said brackets, and a stop member adjustably mounted on said second piece of material and including an adjustable securing element.

---



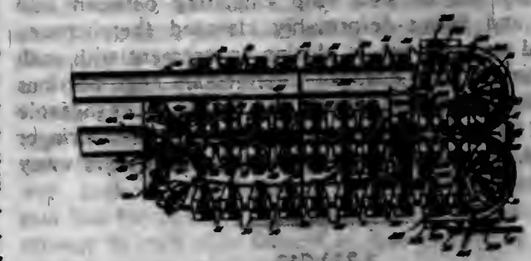
2,772,708
INTEGRAL LOOP BLADE-ANCHORING MEANS FOR HIGH-FREQUENCY RECIPROCATING SAWS
Francois M. Miquel, Paris, France, assignor to Société Anonyme Tabest, Paris, France, a French company
Application November 28, 1955, Serial No. 549,530
Claims priority, application France December 3, 1954
3 Claims. (Cl. 143—133)

1. A saw-blade of the type having both its ends provided with anchoring means to hold said blade taut upon its engagement into aligned anchoring slots, provided in the ends of the arms of the support of a vibrating saw of the type described, said blade being characterized by the feature that the anchoring means of at least one of its ends are constituted by said end itself bent into a loop adapted to bear under elastic deformation against the outer edges of one of said slots upon engagement of said blade into both of said slots, whereby said loop permanently remains in contact with said edges upon vibration of said arms under alternate re-assuming of its non strained initial shape and further increase of said elastic deformation.

2,772,709
AUTOMATIC MORTISING AND TENONING MACHINE
Theodore David Foster, Cincinnati, Ohio, assignor to The Bell Machine Company, Oshkosh, Wis., a corporation of Wisconsin
Application August 15, 1952, Serial No. 304,503
21 Claims. (Cl. 144—87)

1. In an automatic mortising and tenoning machine: an elongated cutter head having a row of side-by-side power driven cutters constrained to rotate on parallel axes normal to the longitudinal axis of the cutter head; a carrier for the cutter head; means mounting the cutter head in bearings at one end of the carrier and adjustably holding the cutter head in either a mortise cutting position at which the common plane containing the cutter axes is upright, with the cutters facing upward, or a tenon cutting position in which the common plane containing the cutter axes is horizontal and the cutters face outwardly from said end of the carrier, and in both of which positions the cutter head is constrained to move with the carrier; means mounting the carrier for vertical reciprocation and for horizontal movement along two right angularly disposed axes, one of which is parallel to the longitudinal axis of the cutter head; motion imparting means for imparting to the carrier only vertical reciprocation between defined limits; motion imparting means for imparting to the carrier only horizontal back and forth motion between defined limits in the direction parallel to the longitudinal axis of the cutter head; synchronizing means constraining said two motion imparting means to move in timed relation so that they cooperate in imposing upon the carrier a resultant orbital tenon cutting motion; an instrumentality for imparting only horizontal back and forth movement to the carrier along an axis normal to the longitudinal axis of the cutter head to impart in and out mortise cutting movement to the carrier; a driver; and means for selectively connecting with said driver either said two motion imparting means or said last-named instrumentality.

---



2,772,710
FRUIT CUTTING, SPREADING, AND FITTING MACHINE
Charles V. Rinehart, Tucson, Ariz.
Application December 30, 1953, Serial No. 401,256
6 Claims. (Cl. 146—28)

1. A machine of the character described comprising a supporting structure, an elongated table-top supported thereby, a pair of endless conveyors disposed in side-by-side relation and each extending from end-to-end of the table-top, means mounting said endless conveyors adjacent the ends of the table-top and positioning the upper flights of the endless conveyors for movement longitudinally along the upper surface of the table-top, a rotary cutting knife, a shaft fixed to said cutting knife, means supporting said shaft above the table-top spaced from the ends thereof and positioning a lower portion of the knife between said upper flights of the endless conveyors, driving means connected to said shaft for revolving the knife, and means forming a driving connection between said shaft and said endless conveyor mounting means and causing the upper flights of said endless conveyors to travel longitudinally of the table-top in one direction, said endless conveyors being maintained in close adjacency to one another by said mounting means whereby an apricot or the like will be conveyed by the pair of endless conveyors toward the knife to be cut in half thereby and so that the severed fruit halves will be subsequently supported on and conveyed separately by said endless conveyors, said means forming a driving connection including means intermittently driving said endless conveyors for conveying the fruit by a step-by-step movement from end-to-end of the table-top, said knife including a plurality of circumferentially spaced blades movable in synchronized relation to the endless conveyors whereby successive apricots will be cut successively by the different blades of the knife.

---

2,772,711
FRUIT HALVING DEVICES
Ellsworth W. Carroll, Redwood City, Calif., assignor to S & W Fine Foods, Inc., San Francisco, Calif., a corporation of California
Original application June 10, 1949, Serial No. 98,260. Divided and this application May 11, 1951, Serial No. 225,731
1 Claim. (Cl. 146—73)

In a machine for halving fruit, the combination of a carrier movable over a fixed horizontal path, power means connected to drive said carrier over said path, support means mounted on said carrier to receive and support a fruit fed thereinto for movement over said path, lateral fruit restraining members pivotally mounted on each side of said carrier for movement thereby, said restraining members being normally spring locked in position above and on each side of said fruit support means and loosely spaced around a fruit fed onto said support to permit free movement of said fruit therewithin during movement thereof over said path, a power saw vertically mounted in the path of said carrier, the cutting edge of said saw being positioned to bisect said fruit being moved over said path, and cam lever means mounted on each side of said carrier, said cam lever means being located in said path of said restraining members to contact and unlock said normally spring locked restraining members, said members being movable by gravity from said position loosely spaced around said fruit to a position closely spaced around said fruit to grip said fruit as said fruit is moved through the cutting edge of said saw for halving thereby.

---

2,772,712
ACTUATOR FOR ZIPPERS AND POUCH EMBODYING THE SAME
Louis Post, Bronx, N. Y., assignor to Flexigrip, Inc., New York, N. Y., a corporation of New York
Application March 14, 1952, Serial No. 276,475
8 Claims. (Cl. 150—3)

8. A sliderless fastener structure of the type that is closable by being manually pressed together longitudinally

thereof, comprising flexible stringers of heat sealable plastic material having sheet-like portions and integral thickened edge portions, the sheet-like portions extending away from each other and lying generally in the same plane and the edge portions overlapping each other and having on confronting faces longitudinally extending grooves and ridges, each of said ridges having an enlarged head portion and a constricted neck portion and each of said grooves having a restricted opening and an enlarged bottom portion, said grooves in one of said thickened edge portions being aligned with and corresponding in cross-section to the ridges in the other of said edge portions and vice versa whereby said edge portions may be interengaged by being pressed together progressively along the lengths thereof, corresponding ends of said edge

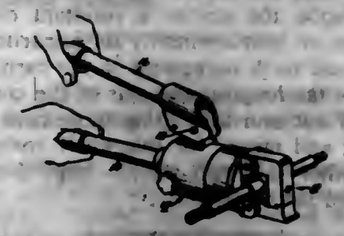
portions being so interengaged and being integrally united to each other and to said sheet-like portions, and an actuator to form a localized gap in the engagement of said edge portions intermediate said ends, comprising a thin, narrow, flexible strip having a manually engageable outwardly projecting end and an inner anchoring portion secured to the inside of one of said stringers, the intermediate portion of said strip extending between said stringers and being deformably clamped therebetween when said stringers are in closing engagement with each other, whereby said engaged intermediate edge portions can be disengaged by pulling said manually engageable end away from the sheet-like portion of said other stringer to exert a separating force upon said one stringer away from said other stringer.

---

2,772,713
**LADY'S HANDBAG WITH MULTIPLE COMPARTMENTS**
Richard Koret, Bedford Hills, N. Y., assignor to Koret, Inc., New York, N. Y., a corporation of New York
Application June 12, 1956, Serial No. 590,942
7 Claims. (Cl. 150—28)

1. A lady's handbag comprising in combination a pair of generally vertical side wall panels, a bottom wall panel joining said side wall panels along their bottom edges, a pair of generally vertical end wall panels joining the side edges of one of said side wall panels with corresponding side edges of the other of said side wall panels and joining with said bottom wall panel, said panels forming a handbag body and defining an open-topped receptacle, said end wall panels being foldable inwardly of said receptacle upon movement of said side wall panels toward each other, releasable means engaging said side wall panels approximately midway between the top and bottom edges thereof for limiting the separation of said side wall panels and substantially closing off the bottom portion of said receptacle to form upper and lower compartments therein, at least the upper portions of said side walls being relatively flexible and being separable when said side walls are engaged by said releasable means, and pocket means exposed in said upper compartment.

---

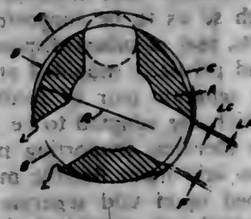


2,772,714
**RUBBER VALVE STEM**
Oakley W. Hosking, Monroe, N. Y.
Application February 26, 1953, Serial No. 339,127
2 Claims. (Cl. 152—430)

1. In a valve stem, an elongate tubular resilient rubber body having imbedded in its walls and coaxial therewith a rigid tubular member, said member having a neck projecting beyond the body for receiving a valve inside and having an anchorage portion comprising a tubular section provided on its outer peripheral surface with longitudinal outwardly radially extending fins joined with said neck, said tubular section and fins being completely enclosed on their inside, outside and one end by said rubber body in which the neck portion of the tubular member includes a tapered collar connected to the anchorage portion, said collar having a skirt surrounding a part of the anchorage portion and fins and secured to the latter, the rubber of the body occupying the space inside said skirt.

---

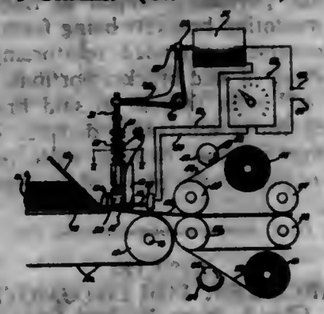
2,772,715
**CRIMPING TOOL**
Kenneth L. Neijstrom, Camp Hill, Kenneth E. Peterson, New Cumberland, and William R. Evans, Oberlin, Pa., assignors to Aircraft-Marine Products, Inc., Harrisburg, Pa.
Application March 24, 1954, Serial No. 418,348
3 Claims. (Cl. 153—1)



2. In a tool for crimping electrical conductors, of the type having a die member movable on the tool body toward a die element supported on the tool head, the improvement whereby said die element can be latched in a closed position and is automatically latched and locked in predetermined position on the tool head opposite said die member when it is closed and automatically swings into the fully open position when unlatched, said improvement comprising: a unitary die element support having an L-shape as seen in elevation including a top portion adapted to support said die-element and a side arm integrally attached to said top portion, first pivot means connecting the butt end of said side arm to the tool body at one side thereof, said support being swingable about said first pivot between a closed position in which said top portion is opposite said die member and an open position in which said top portion is offset laterally from the tool body, first spring means urging said unitary die element support toward its open position, said top portion having a first latch surface thereon, a unitary releasable latch, second pivot means connecting said latch to the tool body on the opposite side thereof from said first pivot means, said latch having a second latching surface adapted to overlap and

lock with the latch surface of said top portion when closed, and second spring means urging said latch into engaging position with said second latch surface overlapping and locking with said first latch surface to hold said support in its predetermined closed position against the action of said first spring means, whereby said first spring means urges the die element support into tight locking engagement with the latch in the closed position firmly holding the top portion of the die element support in a predetermined position opposite the movable die member and said first spring means urges the die element support into the fully open position when the latch is released.

---

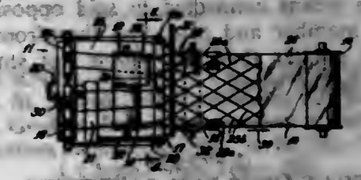


2,772,716
**TUBE-EXPANDING TOOL**
Walter E. Story, Levittown, Pa.
Application August 27, 1954, Serial No. 452,571
9 Claims. (Cl. 153—82)

5. A roller-cage, for a roller-type tube-expanding tool, having a plurality of angularly spaced roller-slots in which the rollers of said tool may be contained and guided so that said rollers may be rotatable about the tapered mandrel of said tool and radially movable as said mandrel is axially advanced relative to said roller-cage, with said roller-cage having a clearance hole extending longitudinally through said cage to provide for the axial movement of said mandrel, relative to said roller-cage, with said angularly spaced roller-slots being separated by ligaments; wherein the outer surface of each of said ligaments, in said roller-cage, is flattened by being formed to a curved shape with the profile of said curved shape being a curve with radius larger than one-half the external diameter of the ligament portion of said roller-cage.

---

2,772,717
**METHOD AND APPARATUS FOR MAKING PAPER COVERED WOOD VENEER ASSEMBLIES**
Richard N. Ware, Jr., Tallulah, La., assignor to Chicago Mill and Lumber Company, Chicago, Ill., a corporation of Delaware
Application September 21, 1954, Serial No. 457,486
9 Claims. (Cl. 154—1.6)

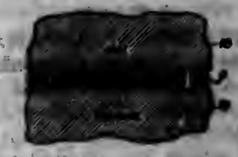


2. The method of making box blanks which comprises successively urging panels or the like against a stop, freeing the panels from the stop in sequential timed relation to control the spacing between the panels, advancing the freed panels in uniformly spaced relation between sheets of paper, and gluing the spaced panels to the paper.

7. Apparatus for forming paper covered veneer panels which comprises means for supporting a stack of veneer panels, a conveyor means arranged to transport a single panel from said stack, an abutment means arranged to be engaged by said single panel during its movement, a switch in said abutment means arranged to be engaged by said panel when said panel engages said abutment means, an electrically operated impact means arranged to impact against said panel when said panel engages said abutment means, a time delay mechanism in series with said switch, said mechanism being arranged to delay the operation of said impact means for a predetermined interval after said panel engages said switch, and paper applicator means arranged to receive said panel from said conveyor means and apply a sheet of paper on each side of said panel.

---

2,772,718
**APPARATUS AND METHOD FOR MAKING REINFORCED SHEET MATERIAL**
Elton E. Magnuson, Ann Arbor, Mich.
Original application October 17, 1951, Serial No. 251,729. Divided and this application November 6, 1952, Serial No. 319,699
8 Claims. (Cl. 154—1.76)

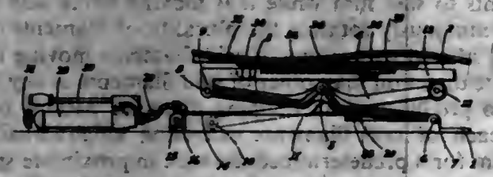


1. The method of forming a reinforced, webbed sheet which comprises conducting a continuous plastic film along a straight path, laminating a plurality of individual filaments to said film while it is moving along said path, and continuously rotating the plurality of filaments transversely of said path, some of said filaments moving in the opposite direction than other of said filaments at any given time to produce an overlapping diamond pattern of the web, each of said filaments extending longitudinally of said film for a predetermined distance in proximate spaced relation to each edge thereof so that succeeding filaments overlap to form reinforcing beads.

2. A device of the class described comprising a laminating means, means for conducting a continuous plastic film through said laminating means, a plurality of spools for supplying filaments to said laminating means, a moveable conveyor element having guide eyelets thereon for guiding filaments from said spools and between said laminating means, said eyelets moving transversely to said means and beyond the edges of the film to cause said filaments to overlap and guide bars set perpendicularly to the film for confining movement of the filament to positions within the edges of said film and forming a reinforcing therealong.

---

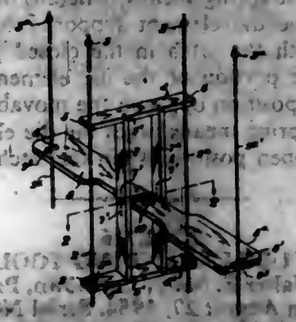
2,772,719
**METHOD OF WELDING RUBBER ARTICLES**
Robert L. Wills, Blue Island, Ill.
Application July 9, 1954, Serial No. 442,403
9 Claims. (Cl. 154—14)



1. The method of welding sheet rubber which consists entirely of buffing opposed edges that are to be joined and areas on the underside of the sheet material adjacent the said edges, applying only one strip of tube gum intermediately the said edges, and vulcanizing the tube gum by the application of heat and pressure simultaneously causing said tube gum to be swaged into an inverted T formation.

2,772,720
**GOLF CART SEAT**
Forrest F. Zody and John E. Kay, Jr., Houston, and Wood N. Tayler, Jr., Bellaire, Tex., assignors to Junior Achievement, Inc., New York, N. Y., a corporation of Massachusetts
Application February 3, 1955, Serial No. 485,896
9 Claims. (Cl. 155—5)

1. A seat adapted to be operatively associated with the wheel of a golf cart or the like comprising a seat member including a portion having a slot for receiving a portion of a wheel with which said seat is adapted to be operatively associated and including an opposite portion, and leg means connected to said opposite portion of said seat member and extending therefrom an effective distance greater than the radius but smaller than the diameter of the wheel.



2,772,721
**SEAT UNIT FOR BATHTUBS**
Harry Baird Saunders, Woodland, Calif.
Application November 9, 1954, Serial No. 467,763
4 Claims. (Cl. 155—36.5)

1. A portable, vertically adjustable seat unit adapted for use on a bathtub or the like, comprising a base, a platform disposed above the base, transversely spaced pairs of lever arms extending between the base and platform, the lever arms of each pair intersecting and being pivoted together intermediate their ends, means pivoting one arm of each pair at the adjacent ends to the base and platform, a roller on the lower end of the other arm of each pair, guide channels on the base corresponding to and having the corresponding rollers therein, a roller on the upper end of said other arm of each pair, said last named rollers supporting the platform from below, a fluid pressure actuated power cylinder extending along the base between the guide channels, means securing the power cylinder at one end to the base, links connected between the opposite end of the power cylinder and the lower ends of said other arms of the pairs, and a seat mounted on the platform.

2,772,722
**RECREATIONAL APPARATUS**
Theodore F. Passman, Chinook, Mont.
Application April 28, 1954, Serial No. 426,094
3 Claims. (Cl. 155—63)

1. A swing comprising a pair of main flexible members the upper ends of which are adapted to be connected to and depend from elevated supporting means, the lower end portions of said members being provided with supports releasably clamped thereupon, a frame consisting of upper and lower parallel transverse members, the opposite outer corresponding end portions of which are respectively formed with alined openings through which said flexible members extend, and spaced parallel struts extending between and rigidly secured at their opposite ends to said transverse members, said lower transverse member being arranged to engage and to rest upon said supports, whereby said frame is supported on and swingable with said flexible members relative to the elevated supporting means, a shaft in the form of a bolt disposed

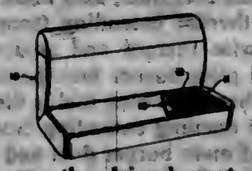
between and parallel to said transverse members and extending through so as to be supported at its opposite ends on said struts, seat members disposed at right angles to said frame and pivotally mounted at their inner ends on said shaft, a separate pair of flexible members the upper ends of which are adapted to be connected to and depend from the elevated supporting means in a plane at right angles to said main flexible means, and means releasably clamped upon said separate pair of flexible members for supporting engagement with the outer ends of said seat members and arranged to co-operate with said shaft to support said seat members substantially horizontally.

2,772,723
**SPRING UNIT FOR PLATFORM ROCKING CHAIR**
Jack B. Tunnell, Hickory, N. C., assignor to Hickory Springs Manufacturing Company, Inc., a corporation of North Carolina
Application February 8, 1954, Serial No. 408,717
3 Claims. (Cl. 155—71)

1. A spring unit for a platform rocking chair, said unit comprising a pair of mounting brackets for attachment respectively to a rocking chair and platform base therefor, and a pair of springs assembled with said brackets for reacting in opposed relation to rocking movement of said chair on said platform base, each of said mounting brackets having a mounting flange portion and a spring assembly flange portion arranged at right angles, and each of said mounting brackets being formed with a plurality of transversely extended reinforcing ribs spaced along the juncture of said bracket portions, said ribs each extending at 45° with respect to said bracket portions and continuing for a substantial distance in said spring assembly flange portion formed with its outer edge parallel with respect to the plane of said spring assembly flange portion.

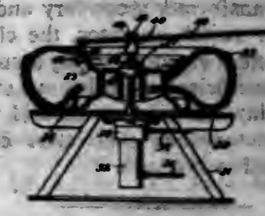
2,772,724
**ADJUSTABLE REST FOR LOCOMOTIVE SEAT**
Glen L. Nass, Willard, Ohio
Application November 3, 1952, Serial No. 318,480
1 Claim. (Cl. 155—160)

An adjustable back rest device for a seat comprising: upwardly extending support means adapted to be secured to a seat; a back rest portion having a rigid back member; slide means connected to the back side of said back member and in slidable engagement with said support means whereby said back rest portion can slide up and down with respect to said support means to adjust the vertical height of said back rest portion with respect to



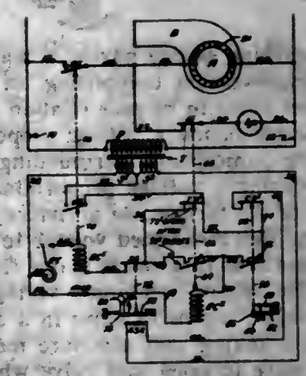
said seat; locking means connected to said back member and in engagement with said support means for locking said back member to said support means at any one of a number of fixed positions, said locking means comprising a locking plate having a plurality of spaced apart holes mounted on said upwardly extending support, a tube secured to said back member with one open end facing the holes in said plate, an L-shaped slide bolt one leg of which is slidably and rotatably mounted within said tube, and a stop mounted on said back member at a location spaced from the end of said tube opposite said locking plate, the end of one leg of said slide bolt in its locking position being within one of the holes in said locking plate and the other leg extending downwardly between

said stop and the end of said tube, said stop preventing the withdrawal of said slide bolt in this position, said other leg of said bolt being turned about said first leg within said tube clearing said stop to permit withdrawal of the end of said slide bolt from said hole in said locking plate; said support means including a fixed member adapted to be connected to said seat, a movable member, and angularly adjustable means connecting said movable member to said seat whereby the angular position of said movable member with respect to said seat can be altered; and manually controlled locking means connected to said support means for locking the movable member of said support means to said fixed member at any one of a plurality of fixed angular positions.



2,772,725
**DRIVER-REST PAD**
Stanley Lozano, Antofagasta, Chile
Application February 1, 1955, Serial No. 485,501
1 Claim. (Cl. 155—182)

A pad for use on the driver's seat of an automobile whereby the fatigue of the operator may be relieved comprising a seat portion having a bottom covering sheet, a top covering sheet and a sheet of stiffener material situated between said top and bottom covering sheets, and a support portion at the right extremity of said pad and extending from front to back of said pad, said support portion comprising a roll of foam rubber substantially semicircular in cross section, the radius of said roll diminishing from front to back of said pad.

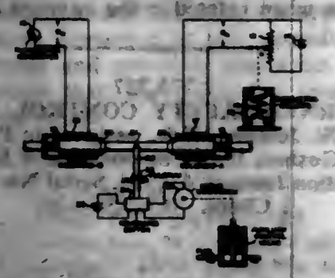


2,772,726
**CIRCUMFERENTIALLY TRAVELING TYPE TIRE MOUNTING AND DEMOUNTING APPARATUS**
Vincent F. Mercaldo, Philadelphia, Pa.
Application September 16, 1952, Serial No. 309,884
5 Claims. (Cl. 157—1.24)

1. Equipment for servicing tires including a table for supporting a tire and rim, a vertical rod projecting from said table at a central location with respect to the tire and rim when in position, a detachable fitting for slidably, rotatably and pivotally connecting a tire manipulating device to the upper end of said vertical rod, said device incorporating an elongated handle, a tire and rim engaging part attached to and located below said handle, said

part having a groove formed by two flanges at its inner side for engaging the peripheral edge of the rim and a smooth curved external surface for engaging the edge of the tire and moving it to the outside of said rim when said device is rotated about the axis of said rod in one direction and for moving the edge of the tire into position inside the rim when rotated in the opposite direction.

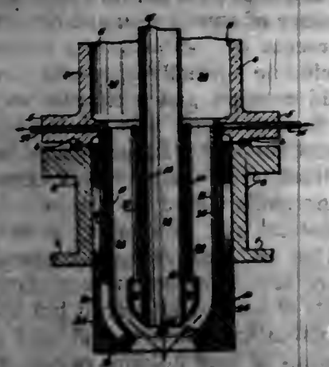
2,772,727
**OIL BURNER SAFETY CONTROL SYSTEM**
Paul Schell, St. Joseph, Mich., assignor to Penn Controls, Inc., Goshen, Ind., a corporation of Indiana
Application January 4, 1954, Serial No. 401,745
1 Claim. (Cl. 158—28)



An oil burner control mechanism of the type which controls an oil burner and its ignition means in response to actuation of a remote control switch, said mechanism comprising: a main switch, burner motor and ignition circuits controlled thereby; a transformer providing a source of electrical power; a control circuit network connected across the secondary of said transformer, a room thermostat, a holding switch, a safety switch, and a delayed safety switch actuator all connected in said circuit network; an electromagnetic operator connected in said network and adapted upon energization to close said main switch and said holding switch; combustion responsive means including in said network cold contacts closed only in the absence of combustion and hot contacts closed only in the presence of combustion; a transfer switching mechanism including normally open and normally closed contacts in said network and a transfer switch operator therefor; said control circuit network including an initial energizing circuit for said electromagnetic operator comprising said transformer secondary, room thermostat, safety switch, normally closed transfer switch, closed cold combustion contacts and said safety switch actuator; a holding circuit for said electromagnetic operator energized by a segment of said transformer secondary and including the elements of said initial circuit but by-passing said closed cold combustion contacts and said safety switch actuator by means of said holding switch; a maintaining circuit for said electromagnetic operator energized by a segment of said transformer secondary and including said room thermostat, safety switch, normally open transfer

switch, closed hot combustion contacts and said holding switch; and means controlling energization of said transfer switch operator and consequently the transfer of the energizing circuit for said electromagnetic operator from said holding circuit to said maintaining circuit, said last mentioned means including a circuit energized by a segment of said transformer secondary and connecting in series said transfer switch operator, the closed hot combustion contacts and a resistor having a substantial negative temperature coefficient of resistance said resistor being adapted to delay energization of said last mentioned circuit for a predetermined time after closure of said closed hot combustion contacts.

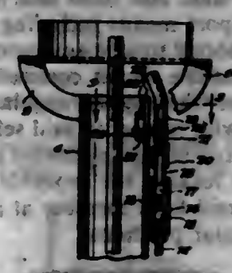
---



2,772,728
**TURBOJET IDLE-SPEED CONTROL**
Emil A. Mallick, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Application March 17, 1952, Serial No. 276,948
3 Claims. (Cl. 158—36)

1. In a gas-turbine engine having a main fuel supply control, the improvement comprising, in combination: an auxiliary fuel valve in by-pass relation with said control; means for producing a voltage proportional to the pressure of the atmosphere surrounding said engine; means for producing a voltage proportional to the rotational velocity of the turbine; an armature means; means for applying the first-mentioned voltage to tend to cause movement of said armature means in one direction; means for applying the second-mentioned voltage to tend to cause said armature means to move in a different direction; and means linking said armature means with said auxiliary fuel valve to open said valve when said armature means moves in the first-mentioned direction and to throttle said valve when said armature means moves in the latter-mentioned direction.

---



2,772,729
**APPARATUS FOR COMBUSTION OF HYDROCARBONS**
Robert L. Mayhew, Great Neck, N. Y., assignor to Hydrocarbon Research, Inc., New York, N. Y., a corporation of New Jersey
Application May 3, 1951, Serial No. 224,283
3 Claims. (Cl. 158—109)

1. A burner assembly for combustion of fuel gas comprising an inner conduit of uniform circular cross section terminating in a discharge port of the same cross section, an outer conduit disposed coaxially about said inner conduit in spaced relationship therewith to define an annular passage between the conduits, said outer conduit comprising a relatively elongated upstream section of uniform diameter and a downstream section of gradually reduced diameter extending beyond the discharge end of said inner conduit and terminating in a discharge port having a diameter larger than that of said discharge port of said inner conduit, and means for cooling said discharge end of said inner conduit at said discharge port thereof comprising an annular cooling chamber located at and surrounding said discharge end of said inner conduit, said cooling chamber diminishing in diameter downstream toward said discharge end of said inner conduit and forming a sharp edge therewith, said annular passage defined by said outer conduit being restricted by said cooling chamber at said discharge end of said inner conduit thereby providing a high velocity gas flow therethrough without a corresponding large pressure drop due to conduit friction, said outer conduit having an annular cooling chamber in contact with said section of gradually reduced diameter and being located at said discharge end of said outer conduit and spaced opposite said means for cooling said discharge end of said inner conduit.

---

2,772,730
**GAS BURNER AND CONSTANT PILOT**
Robert I. Warnecke, Cheektowaga, N. Y., assignor to Roberts-Gordon Appliance Corporation, Buffalo, N. Y.
Application August 14, 1953, Serial No. 374,221
2 Claims. (Cl. 158—115)

1. A gas burner for re-igniting the fuel after flareback of burnt gas during the ignition of the burner, said burner including a main fuel duct having a fuel discharge outlet, a pilot burner tube located adjacent to said main fuel duct and terminating at its upper end above said discharge outlet of said main fuel duct, said main fuel duct having a slot in a side thereof extending from said outlet substantially lengthwise thereof and adjacent to said pilot burner tube, said pilot burner tube having an opening in the side thereof through which fuel is discharged to maintain a flame, said opening extending below the lower end of said slot in said main burner duct and adjacent said slot whereby gas flowing from said slot will pass by said opening, and gas deflecting means in said main fuel duct for deflecting some of the fuel flowing therein outwardly toward said opening in said pilot tube through said slot and in igniting relation thereto, said deflecting means including a channel-shaped member secured to the interior of the main duct and having the open side thereof extending across said slot, said channel being open at the lower end thereof and having a deflector at the upper end thereof for deflecting fuel from said channel through said slot.

---

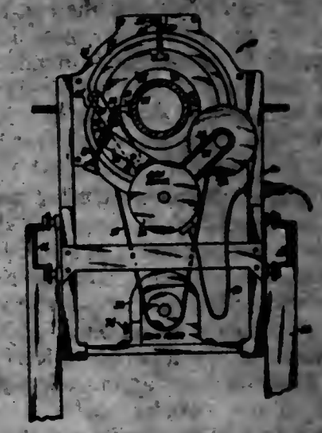
2,772,731
**WINDOW SCREEN**
George Kerbs, Lynwood, Calif.
Application May 21, 1954, Serial No. 431,425
3 Claims. (Cl. 160—28)

3. In combination, a window frame having vertical side members having lower ends, a sill extending between said lower ends, and a vertically slidable sash mounted on

said vertical side members, said sash having a lower end and an outer side, a housing superimposed upon said sill and extending between said vertical side members, said housing having open ends, a top panel, an outer panel, and a bottom panel, and being devoid of an inner panel and being open at its inner side, said top panel and bottom panel having facing slots at the open ends of the housing, bracket plates secured to the frame side members at the lower ends of the side members near the sill at points outwardly of said sash, said bracket plates having upper and lower edges engaged removably in said facing slots with the bracket plates closing the open ends of the housing, a roller within the housing, means on the bracket plates mounting the roller at its ends, and a flexible screen

circumposed on said roller and secured thereto at one end, the roller having another end extending through the open inner side of the housing, and means securing the said other end of the screen to the outer side of the sash at its lower end, said securing means comprising an outwardly projecting flange terminating in a depending flange, and said top panel of the housing having an upstanding lip extending therealong over which said depending flange engages in a lowered position of said sash, and a vertical channel guide secured to a frame side member above said housing, said screen having a side edge slidably engaged in the channel guide and the guide having a lower end provided with an outset tab engaged over the upstanding lip on the housing.

---



2,772,732
**WEB SLITTING APPARATUS**
Bernard Joseph Kerwin, Tonawanda, and Elias Wech, Buffalo, N. Y., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application August 11, 1953, Serial No. 373,566
4 Claims. (Cl. 164—39)

1. In a web slitting apparatus comprising two spaced web guide means over which a continuous web is passed under tension and severing means operative to slit the continuous web along its longitudinal axis at predetermined transverse intervals as it passes between said guide means, said severing means positioned above and extending transversely of the path of travel of the web between said guide means, an improved severing means comprising a screw threaded shaft; a plurality of flat plates mounted in face-to-face contact by means of registered holes on said shaft, portions of alternate plates being cut away to provide slots, said slots adapted to seat a cutter blade with a portion of the cutting edge projecting into the path of travel of the web and with the top edge of the blade opposite the cutting edge extending above the top edge of the plate; cutter blades seated in said slots, the thickness of said cutter blades being at least equal to the thickness of said slot-providing plates; means at both ends of said shaft adapted to press the assembled plates together to form a plate assembly rotatable with the shaft; a cover plate bearing on the top edges of the cutter blades, extending the entire length and width of the plate assembly, and rotatable independently of said plate assembly about the axis of said shaft.

---

2,772,733
**PIPE-CUTTING APPARATUS**
Henning T. Tornberg, Ridgewood, N. J., assignor to Modern Plastic Machinery Corp., Lodi, N. J., a corporation of Delaware
Application November 30, 1953, Serial No. 399,941
12 Claims. (Cl. 164—68)

1. In a pipe-cutting apparatus of the character described, a member having an opening therethrough, a ring rotatably mounted on said member whereby a pipe may be positioned through said opening and said ring, means on said member to releasably hold said pipe secured to said member, means to rotate the ring, an electric motor pivotally mounted on the ring, a cutting element driven by said motor and carried along therewith; the axes of the ring, the motor shaft and the pivotal connection of the motor on the ring being in parallel spaced relation, a cam track on said member endlessly around said opening and a cam track follower carried along by the motor and in engagement with said track to pivot the motor and saw toward and away from the axis of the pipe; the nature of said track being such that upon rotation of said ring, the cutting element will be moved towards the axis of the ring at the commencement of rotation of said ring and moved away from the axis of said ring at the conclusion of one revolution of said ring.

---

2,772,734
**BIAS CUTTING MACHINE**
David N. Judelson, New York, N. Y., assignor to Oscar I. Judelsohn, Inc., New York, N. Y., a corporation of New York
Application July 28, 1954, Serial No. 446,374
36 Claims. (Cl. 164—61)

1. A bias cutting machine for material in seamed tubular form comprising an elongated mandrel, cutting means adjacent one end of said mandrel for severing the material in tubular form passing over said mandrel into bias-cut material, take-off mechanisms adjacent said one end of said mandrel for removing bias-cut material from said mandrel at a predetermined rate, means for presenting the

material in seamed tubular form to the other end of said mandrel for pull over and along said mandrel by said take-off mechanisms, means at a point along the path of travel of the material through the machine for sensing the movement of seams in the material past said point, and means under control of said sensing means and operatively connected to the presenting means for controlling the presentation of the material in seamed tubular form to said mandrel in dependence upon travel of said seams past said point.

2. In a bias-cutting machine, an elongated relatively flat mandrel over which goods pass under substantially constant tension, said mandrel being of adjustable width and having a center line, a cutting knife arranged angularly of said mandrel and at one side thereof for bias cutting goods, and a windup mechanism including a roller extending substantially across said mandrel at one end thereof, the center line of said mandrel in any position of adjustment intersecting said roller at a point within the lateral limits of said roller which receives bias cut goods.

4. In a machine for bias cutting material comprising a mandrel having a tensioning member movable radially inwardly and outwardly of the center of said mandrel, a cutting knife arranged angularly of said mandrel for bias cutting material, and a windup mechanism for pulling a tube of material over said mandrel and past said cutting knife, and loading means acting on said tensioning member and including a live load operatively connected to said tensioning member and urging said tensioning member outwardly of said mandrel and a dead load operatively connected to said tensioning member and resisting movement of said tensioning member both inwardly and outwardly of said mandrel, the difference between said dead and live loads providing tension on said tube of material and the summation of said dead and live loads providing a reacting force to the pull exerted by said windup mechanisms.

9. In a bias-cutting machine for a tube of material, an elongated mandrel over which material passes under substantially constant tension, a cutting knife arranged angularly of said mandrel at one side thereof for bias cutting said tube of material, and a windup mechanism for pulling said tube over and along said mandrel, said mandrel being relatively flat whereby opposite side edges of said material when bias cut lie in substantially a common plane and including a stationary side bar, an adjustable side bar parallel to said stationary side bar, and cooperating therewith to define the mandrel proper, an extension operatively connected to said adjustable side bar and extending beyond one end of said stationary side bar, and a cantilever support outwardly of said mandrel proper extending transversely of said bars, said cantilever support being operatively connected to said extension and mounting said adjustable side bar for movement toward and away from said stationary side bar.

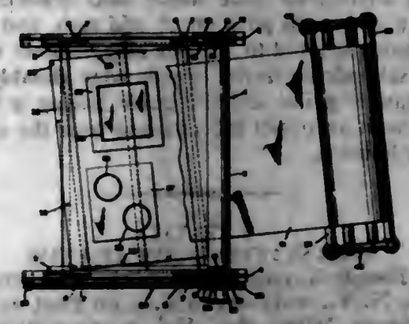
## MULTIPLE SLIDE PRESS FOR CUTTING SHEET METAL PARTS

Ronald L. Wakeley, Chicago, Ill., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application October 9, 1953, Serial No. 385,089
3 Claims. (Cl. 164—86)

2. A punch press for cutting off and removing the end of a sheet metal cylinder comprising a vertically arranged tubular punch formed with a circular cutting edge at its upper outer periphery and as a shaping die at its upper inner periphery, said punch being so proportioned as to fit closely within the cylindrical workpiece and to support the end thereof, a head vertically slidable above said punch, an annular cutting die carried by said head, said die having a cutting edge at its lower inner periphery for shearing engagement around the cutting edge of the

punch, and an ejecting punch slidable centrally of said die and movable into the tubular punch.



---

**2,772,736**

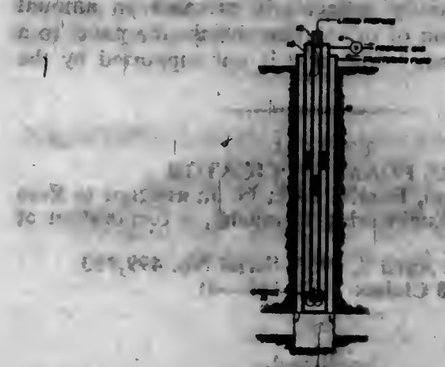
## ROLLER DIE CUTTER

John F. Campbell, Cuyahoga Falls, Ohio

Application May 4, 1953, Serial No. 352,651
10 Claims. (Cl. 164—226)

1. In roller cutter die apparatus, a frame, a sub-frame at each lateral margin of said frame, means for adjusting the vertical positions of said sub-frames with relation to said frame, said sub-frames having longitudinally extending elongate slots therein, a roller, carriage means engaging said elongate slots in said sub-frame to be accurately positioned thereby and engaging said roller to position said roller and hold it fixedly with relation to movement normal to said slots, means for positioning dies on said frame, and means for moving said roller along said frame and for rotating said roller as it is so moved.

---



**2,772,737**

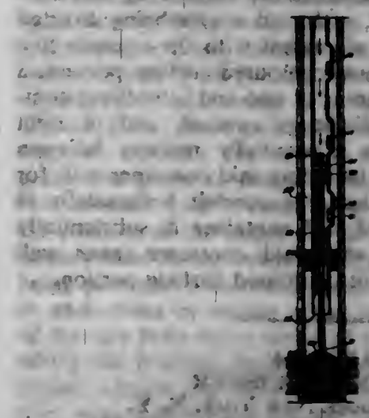
## FRACTURING OIL AND GAS PRODUCING FORMATIONS

Donald C. Bond and Orvin C. Holbrook, Crystal Lake, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

Application December 21, 1954, Serial No. 476,851
8 Claims. (Cl. 166—22)

1. A process for improving the penetrability characteristics of a subterranean, geological formation traversed by a well bore, which comprises introducing into said bore hole a low viscosity liquid having a high, viscosity-temperature coefficient, whereby the viscosity of said liquid at normal temperatures is increased at least tenfold by a decrease in temperature of 25° to 50° F. below the temperature of the formation being treated, cooling said liquid within said borehole sufficiently to produce a high-viscosity, thermal-reversible fracturing fluid having low penetrating characteristics, disposing said fluid adjacent

said formation, and applying to said fracturing medium a pressure sufficient to overcome the overburden pressure of said formation and produce fractures therein.



---

**2,772,738**

## METHOD FOR COMPLETION OF WELLS HAVING HIGH BOTTOM HOLE PRESSURES

Gilbert H. Tausch, Houston, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

Application October 19, 1953, Serial No. 386,767
8 Claims. (Cl. 166—22)

1. A method for cementing a high bottom hole pressure well provided with a perforated casing in a stratum pierced by said well and having a tubing arranged therein with its lower end located above said stratum without contaminating said stratum with mud which comprises forming a first column of mud and a second column of mud and water in said well casing with the volume of water in the second column exceeding the volume of mud in the first column, said columns being parallel to and in fluid communication with each other, equalizing said columns to provide hydrostatic heads in said columns in excess of the bottom hole pressure of the well, replacing the mud in the first column with water, pumping cement into said first column and conducting the water from the first column to a point adjacent the perforations, pumping fluid into said first column after the cement, conducting the cement from the first column to said point adjacent the perforations, forcing a sufficient amount of said cement into the perforations to seal the perforations, pumping mud into the second column, conducting the pumped mud in the second column into contact with the cement to remove excess fluid cement up the first column, and then displacing the pumped mud with water after the cement has set in said perforations.

---

**2,772,739**

## METHOD OF TEMPORARILY CLOSING PORTION OF WELL AND COMPOSITION THEREFOR

Arie Brakel, Maracaibo, Venezuela, and Norman Healey, St. Albans, England, assignors to Shell Development Company, New York, N. Y., a corporation of Delaware

No Drawing. Application September 22, 1954, Serial No. 457,786
Claims priority, application Netherlands September 24, 1953
3 Claims. (Cl. 166—22)

2. In well drilling operations, the step of temporarily closing a portion of a well by forming therein a lightweight acid-soluble closure comprising a mixture of hydraulic cement and lightweight expanded limestone having at least a 30% porosity, allowing said mixture to set and form a closure and subsequently causing disintegration of said closure by subjecting the same to the action of acid to open the well.

---

**2,772,740**

## WELL PACKER

Jack E. Edwards, Houston, Tex., assignor to M. L. Mayfield, Houston, Tex.

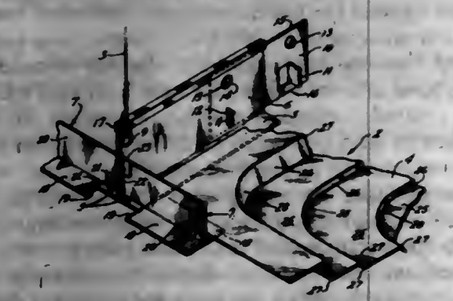
Application November 16, 1953, Serial No. 392,139
10 Claims. (Cl. 166—129)

3. A well packer comprising a generally tubular body, said body having a reduced external diameter extending from a point adjacent its upper portion downwardly throughout its length, a packing band secured about the body above the reduced portion, a sleeve member slidably disposed about the reduced diameter section of the body and below the packing band, slips secured to the sleeve member for radial expansion and contraction into and out of frictional engagement with an inner wall of a casing, a slip expander slidably secured to the body and engaging the slips, said slip expander and slips having guide and slide surfaces for such radial expansion and contraction of said slips, shoulders on the body and slip expander abutting and confining the packing band whereby upon relative downward movement of said body with respect to said sleeve member, said slips are expanded into such frictional engagement thereby fixing said slip expander against further downward movement, continued downward movement of said body compressing said packing band between said shoulders thereby expanding the packing band into sealing engagement with said wall of the casing, a tubular mandrel slidably extending throughout the length of said body and said sleeve member adapted to be connected to a string of pipe for raising, lowering and manipulating the well packer in said casing, an unrestricted annular passageway between the mandrel and the body for circulation of drill fluid, enlargements rigidly connected on the mandrel disposed exteriorly of and spaced from each end of the body for engaging each such end for moving said body relative to said sleeve member, such enlargements and such ends of the body including coacting and engageable valve seating surfaces for selec-

tively closing the passageway at each end at least one J-slot and pin slidable therein on the sleeve member and mandrel releasably locking said mandrel and sleeve member from relative movement, said pin engaging and supporting a lower portion of said body when the J-slot and pin are in locked position, and friction means on the sleeve member yieldingly and frictionally engaging said wall of the casing for holding the sleeve member substantially stationary during movement of said mandrel and body when said J-slot and pin are released.

10. The well packer of claim 3 where the sleeve member extends downwardly below the lower end of the body and the lower end of the body has a recessed portion proximate an inner end of the J-slot so that the mandrel may be elevated to engage the valve seating surfaces on the lower enlargement and lower end of the body by moving the pin into the recessed portion, and upon rotation of the mandrel with respect to the sleeve member the pin is moved out of said recessed portion and into locked position with the J-slot thereby placing the valve seating surfaces on the lower enlargement and lower end of the body in spaced relationship to one another.

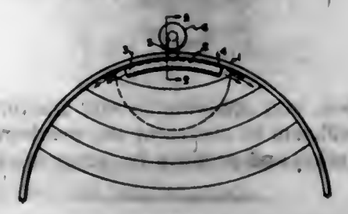
---



**2,772,741**
**COMBINATION PARAFFIN SCRAPER AND ROD GUIDE**
Paul Poteon, Pampa, Tex.
Application June 20, 1952, Serial No. 294,643
5 Claims. (Cl. 166—176)

3. In a paraffin scraper and sucker rod guide for installation at spaced intervals along and concentrically of a sucker rod within a well tubing, in combination with a sucker rod, a tubular cylindrical element, the top and bottom edges of which are parallel to each other and inclined to the vertical, and the side walls of which are parallel to the axis of said sucker rod, a supporting shank integral with each edge and on diametrically opposite sides of said element, the said shanks being inclined inwardly and having their outer ends lying against said rod, and means embracing said rod for securing the said shanks thereto.

---



**2,772,742**
**CEILING CONSTRUCTION**
Cortes N. Sprankle, West Hartford, Conn., assignor to Plax Corporation, West Hartford, Conn., a corporation of Delaware
Application July 12, 1954, Serial No. 442,532
10 Claims. (Cl. 169—1)

1. A ceiling construction including a supporting structure and a ceiling supported by said structure, said ceiling being spaced from said supporting structure and defining an open cavity concealed by the ceiling, said ceiling comprising supporting grid members and a plurality of translucent light diffusing thermoplastic panels bridging the grid members and supported thereby, the plastic of said panels being biaxially molecularly oriented an amount such that relaxation of orientation shrinks the panel to a size which does not bridge and is not supported by the grid members.

---

**2,772,743**
**FIRE FOAM APPLICATOR**
Lester A. Eggleston, Roselle Park, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application April 7, 1955, Serial No. 499,903
8 Claims. (Cl. 169—4)

1. Means for applying fire foam over the exposed surface of a liquid material in a walled container, having an upper end portion and an inner wall surface, comprising a substantially elongated foam discharge conduit, at least one continuous, contoured surface portion longitudinally of said conduit, said surface portion substantially corresponding to the surface contour of said container inner wall surface in a direction horizontally thereof, a foam discharge nozzle substantially defined by said conduit at each end thereof, each said nozzle being directed in substantially parallel alignment with the contour line of said conduit continuous, contoured surface portion, a foam supply conduit opening at one end into direct communication with said discharge conduit, and in right angular relation thereto substantially midway between said nozzles, and means including said container wall for supporting said foam discharge conduit horizontally in the upper end portion of said container in substantially coincident engagement with said container inner wall surface along said conduit contoured surface portion.

---

**2,772,744**
**FIRE EXTINGUISHER**
Simon C. Beaudet, New York, N. Y.
Application May 3, 1954, Serial No. 427,076
2 Claims. (Cl. 169—31)

1. A fire extinguishing device comprising a frangible thin walled glass container for fire extinguishing liquid under pressure, said container having at the upper end thereof liquid entry means and liquid dispensing means, protective means for said container comprising a thin light weight sheath like member enclosing the lower portion of said container and tightly attached to the outer surface of said container portion, and a thin light weight sheathlike member enclosing the upper portion of said container, adjacent portions of said members being in

overlapping relation and the second mentioned member closely hugging the opposed portion of said container and being slidably removable from said container to expose said dispensing means while said first mentioned member provides holding means for said device in the operative position thereof.

---

**2,772,745**
**HELICOPTER WITH DUAL COAXIAL VARIABLE PITCH ROTORS**
Ferdinando Bordoni, Rome, Italy
Application April 2, 1951, Serial No. 218,841
Claims priority, application Italy April 8, 1950
5 Claims. (Cl. 170—135.24)

1. In a helicopter of the type having two rotors rotating in opposite directions, the combination of a stationary tube, an upper rotor and a lower rotor supported in superposed relation by said tube, a driving shaft contained in the said tube, blades on said rotors being allowed to take incidences variable to a desired extent, said rotors each comprising a drum rotating around said tube, a central pinion in said drum for said lower rotor mounted on said driving shaft, an annular gear adjacent to the inner wall of said drum, three pairs of pinions, each pair being interposed between the central pinion and said annular gear, said pairs of pinions being adapted to impart to said annular gear a rotation in a direction opposite to the rotation of the upper one of said two rotors, said stationary tube being interrupted at said lower drum and being provided with two flanges, said flanges being joined to each other by means of six bolts axially bored, three of the said bolts being arranged to form the shafts around which the internal pinions of said three pairs of pinions rotate, a lower and an upper swash plate mounted on said tube underneath the lower and upper rotors, each of said swash plates being formed by two concentric rings, the internal one of which is tiltable with respect to and slidable on the stationary tube and the external one is rotatable around said inner ring, a hub for each of said rotors which surrounds its respective drum and is pivoted thereon by means of two pivots perpendicular to the tube for tilting in a vertical direction, each of said tilting hubs being provided with two projecting arms perpendicular to said pivots last mentioned, a sleeve mounted on each of said arms and rotatable around its longitudinal axis with respect to the tilting hub, a pivot mounted on the free end of each of said sleeves and perpendicular to the latter, a blade introduced into each of said sleeves and pivoted on the pivot of the latter to flap in a vertical direction, an articulated link fixed at one end of each of said sleeves and pivoted at the other end on said external rings of said swash plates, manually operable controlling means to move said lower swash plate and said upper swash plate, said controlling means comprising six rods, three of which are connected to said lower swash plate and the other three are connected to said upper swash plate, the three rods last mentioned passing through three of said bored bolts which connect the flanges of said stationary tube, said six rods being adapted to change the pitch of said blades.

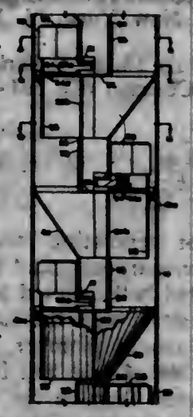
---

**2,772,746**
**SEISMIC EXPLORATION APPARATUS**
Eugen Merten, Houston, Tex., assignor to Shell Development Company, New York, N. Y., a corporation of Delaware
Application July 18, 1955, Serial No. 522,543
3 Claims. (Cl. 181—.5)

1. Apparatus for generating seismic waves for geophysical exploration purposes, said apparatus comprising a heavy thick-walled bell adapted to be positioned with its open side in contact with the surface of the ground, thereby defining a closed chamber, a flexible diaphragm closing the open side of said bell in a gastight manner, valved conduit means through the wall of said bell for introducing an explosive gas mixture into said chamber, ignition means extending into said bell adapted to explode the gas within the chamber of said bell, and valved conduit means through the wall of said bell for releasing exploded gases therefrom.

---

**2,772,747**
**ADSORBER APPARATUS**
Frank M. Browning, New York, N. Y., and William B. Leighton, Maplewood, N. J., assignors to Union Carbide and Carbon Corporation, a corporation of New York
Application August 18, 1955, Serial No. 529,273
7 Claims. (Cl. 183—4.5)

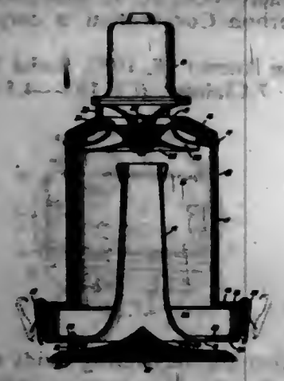


1. An adsorber for recovering fluids and vapors from mixtures thereof with gases, comprising a container vessel, a basket within said vessel, a bed of adsorbent material contained by said basket, a fluid-tight canopy over said basket forming a closed gas space above said bed of adsorbent material, said basket comprising a skeleton framework and removeable corrosion resistant panels, and detachable means for securing said panels to said framework for ready selective removal and replacement of said panels.

---

**2,772,748**
**CONTACTING FLUIDS WITH ENTRAINMENT AND INERTIA SEPARATION**
Earl Manning, Jr., Houston, Tex., assignor to Shell Development Company, Emeryville, Calif., a corporation of Delaware
Application July 21, 1953, Serial No. 369,387
18 Claims. (Cl. 183—22)

1. Method of contacting a liquid with a fluid having a different density, which comprises the steps of: continuously supplying said liquid to an entrainment zone and forming therein a horizontal layer of the liquid; flowing said fluid at a high upward velocity in lateral contact with said layer of liquid and entraining liquid in the fluid substantially at the same rate as that at which liquid is supplied to said zone and forming a high velocity, confined upwardly moving two-phase stream containing liquid distributed over the cross sectional area thereof and in turbulent motion, said liquid being discharged from the entrainment zone substantially only by entrainment in said fluid; flowing said stream in a confined path with a sudden change in direction and at reduced velocity

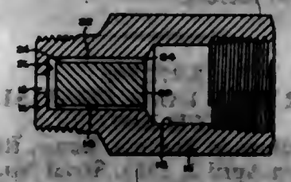


through a separation zone which has an enlarged cross sectional area and is isolated from said entrainment zone

and thereby effecting separation of the phases thereof by inertia; and separately collecting the separated phases.

---

2,772,749
**SEPARATOR**
Anthony J. Nerad, Alplaus, and Robert H. Johnson and Olaf Brandal, Scotia, N. Y., assignors to General Electric Company, a corporation of New York
Application December 16, 1953, Serial No. 398,562
2 Claims. (Cl. 183—36)



1. A dust separator comprising in combination, a base, an annular dust chamber supported concentrically with and adjacent said base, a cylindrical casing coaxially supported by and in register with the upper opening in said dust chamber, a top wall structure on said cylindrical casing having an opening therein, a blower within the said casing adjacent the top wall structure opening and arranged to direct air entering through said opening in a vortical downward movement along the inner surface of said casing, and an upwardly narrowing diameter sleeve having a wide angle diverging lowermost portion, said sleeve being positioned coaxially within said casing with said lowermost portion in register with the annular dust chamber bottom opening, and an uppermost portion extending near said blower, the interior of said sleeve defining an air passage extending through said sleeve and radially outward between said sleeve and said base, whereby vortically downwardly moving air from said blower reverses near the lowermost portion of said sleeve and flows upwardly spirally about the said sleeve to again reverse and exit through said air passage.

---

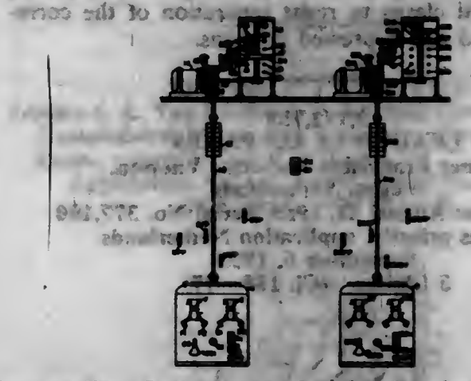
2,772,750
**COALESCING FITTING**
Joseph C. Bystricky, Chicago, Ill., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Application May 12, 1954, Serial No. 429,175
3 Claims. (Cl. 183—75)

1. A coalescing fitting for use in an oil aersol lubricating system comprising, a body having an axial large diameter bore therein and having a radially inwardly extending flange at one end of the bore defining an outlet opening therefrom opening outwardly along the extended axis of the bore, and a generally cylindrical plug having at least one groove in its cylindrical surface generally

parallel to the axis of the plug and open longitudinally outward at opposite ends of the plug, the groove having a cross sectional area which is only a very small fraction of the cross sectional area of the bore, said plug having a press fit in the bore and having one end spaced a short distance from the inner surface of the flange on the body.

---

2,772,751
**PISTON LUBRICATOR AND CYLINDER DUST GUARD**
Edgar W. Patterson, Downey, Calif.
Application September 29, 1954, Serial No. 459,025
4 Claims. (Cl. 184—18)

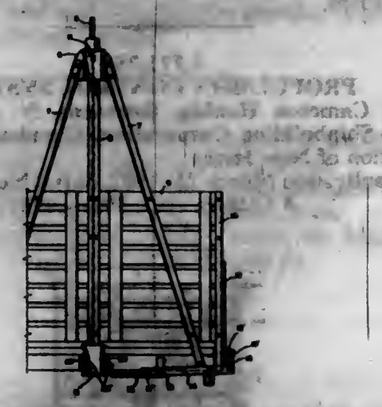


1. In an air balance, the combination of: a cylinder, one end of which is closed and the other end of which is open; a piston slidably reciprocable in said cylinder, said piston sufficiently closely fitting said cylinder and having such a substantial length/diameter ratio as to maintain said piston and cylinder in co-axial alignment; a dust guard mounted on said piston and comprising a cylindrical tube concentrically disposed within said cylinder and extending from said piston to the open end of said cylinder with the piston at its maximum extension into said cylinder, the outer surface of said dust guard being out of contact with and closely spaced from the inner surface of said cylinder; means for effecting relative reciprocation between said cylinder and said piston; means for supplying lubricating oil to the space between said piston and said cylinder, certain portions of said oil thus supplied tending to leak past said piston; oil recovery means disposed adjacent the lower end of said piston and above the upper end of said guard for recovering from the walls of said cylinder a major portion of the oil tending to leak past said piston; and means for returning said recovered oil to said lubricating oil supply means.

---

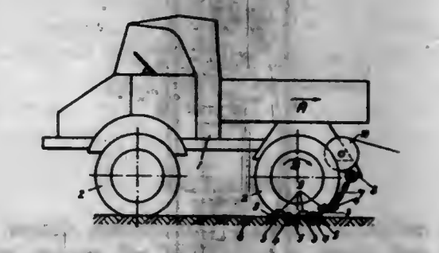
2,772,752
**ELEVATOR SYSTEMS**
John Sacco, Paramus, N. J., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 25, 1954, Serial No. 405,744
40 Claims. (Cl. 187—29)

38. In an elevator system, a structure having a pair of terminal floors and a plurality of intermediate floors intermediate the terminal floors, an elevator car, means mounting the elevator car for movement relative to the structure to serve the floors, motive means operable for moving the elevator car relative to the structure, call registering means for each of the intermediate floors, the call registering means comprising for each of the intermediate floors, a first call registering relay, a second call registering relay, an operating device operable from the associated floor for operating the first call registering relay, and transfer means operable for rendering the operating device ineffective for operating the first call registering relay and effective for operating the second call registering relay, and control means having a first condition wherein the elevator car is conditioned to stop at each of the



intermediate floors approached by the elevator car in a first direction for which a call is registered by one of the first call registering relays, said control means having a second condition wherein the elevator car is conditioned to stop at each of the intermediate floors approached by the elevator car in said first direction for which a call is registered by one of the second call registering relays, said control means when in the first condition being ineffective to initiate a stopping operation of the elevator car in response to calls registered by said second call registering relays, and the control means when in the second condition being ineffective to initiate a stopping operation of the elevator car in response to calls registered by said first call registering relays.

---



2,772,753
**LIFT STAGE AND CAGE ASSEMBLY**
Per O. Nordgård, Arboga, Sweden
Application December 15, 1951, Serial No. 261,817
5 Claims. (Cl. 187—76)

1. A lift stage and cage assembly comprising a cage, a gang-plank hinged to the cage and movable between a position substantially within the outline of the cage as seen in the direction of the up and down movement of the cage within the stage and a position laterally extending from the cage, locking means mounted on the cage movable between a position laterally protruding from the cage and a position withdrawn within the outline of the cage, and transmission means operatively coupling the gang-plank with said locking means for control of the latter by the position of the gang-plank so that the locking means are in the protruding position when the gang-plank is extending from the cage and in the withdrawn position when the gang-plank is situated within the outline of the cage; and the said lift stage comprising support means engageable with said locking means in the protruding position thereof thereby supporting the cage relative to the stage when the said gang-plank is swung outwardly.

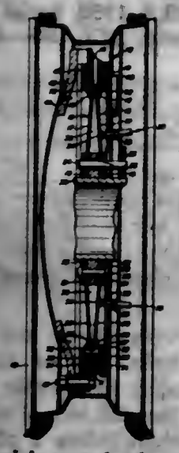
---

2,772,754
**DEVICE FOR ANCHORING A ROAD VEHICLE**
Heinrich G. F. Roessler, Gaggenau, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany
Application April 9, 1952, Serial No. 281,307
1 Claim. (Cl. 188—4)

In a road vehicle with wheels and having a hoisting mechanism used to hoist, tow or draw objects to the vehicle, a pair of readily removable anchoring devices adapted to be placed beneath two of said wheels, each of said anchoring devices including a plurality of substantially rectangular plate members and of annular link members interconnecting adjacent plate members to thereby form a flexible chain-like structure in which said plate members alternate in succession with said link members, each plate member being provided with an angularly bent, downwardly projecting flange portion integrally formed therewith along the side thereof opposite said hoisting mechanism and extending over the entire width thereof to ensure a firm grip on the road when weighed down by a wheel and two upwardly extending lateral portions to accommodate the wheel therebetween, a frame member located in the rear of the vehicle, and chain means connecting each anchoring device to said frame member to be pulled taut when the vehicle is moved rearwardly to anchor said plates under the wheels of the vehicle and to thereby keep the vehicle in the anchored position when used to draw an object toward the vehicle.

---

2,772,755
**PUMP TYPE HYDRAULIC BRAKE**
Friedrich K. H. Nallinger and Joseph Dunbea, Stuttgart, Germany, assignors to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany
Application July 6, 1951, Serial No. 235,522
Claims priority, application Germany July 13, 1950
9 Claims. (Cl. 188—91)



1. In a vehicle, the combination with a member connected with the vehicle wheels to be driven thereby of a pump of the variable delivery type, said pump comprising a rotor connected to said member to be driven there-

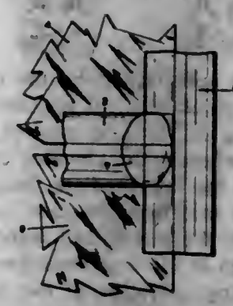
by, at least two stators surrounding said rotor, means for mounting each of said stators for adjustment between a co-axial non-feeding position and an eccentric feeding position relative to said rotor, and means for adjusting said stators in opposite directions.

---

2,772,756
DISK-TYPE BRAKE
Claude Hector May, Columbus, James E. Ballmer, Canal Winchester, and Thomas M. Trainer, Columbus, Ohio, assignors, by direct and mesne assignments, to The Murray Corporation of America, Detroit, Mich., a corporation of Delaware
Application August 30, 1952, Serial No. 307,356
15 Claims. (Cl. 188—152)

1. A brake comprising: a brake ring; a pair of brake disks oppositely disposed about said brake ring; mechanical connecting means holding the inner portions of said disks in fixed spaced relationship to each other; a fluid, normally under pressure, between said disks; and means for controlling the pressure of said fluid; each said disks comprising a surface of revolution having: an annular, substantially flat, inner first portion, substantially perpendicular to the axis of said disk; an annular, intermediate second portion comprising the lateral surface of a shallow, conical frustum extending from said first portion toward the other disk; an annular, intermediate third portion comprising the lateral surface of a steep, conical frustum extending from said second portion away from the other disk; and an annular, outer fourth portion substantially perpendicular to said axis of said disk.

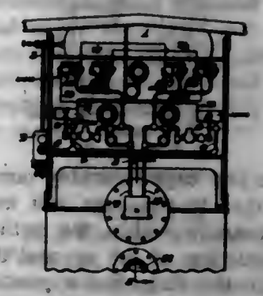
---



2,772,757
STRUCTURAL MATERIAL
Gordon Hammond, Ashland, Va.
Application November 19, 1952, Serial No. 321,349
3 Claims. (Cl. 189—34)

1. A cellular core for use in a structural panel, comprising a plurality of superimposed elongated metal foil strips having transversely extending alternately raised and depressed portions, the raised portions of each of said strips abutting the depressed portions of an adjacent strip and forming transverse cells therewith between said raised and depressed portions, and at least two clasps each formed from a pair of metal foil tongues extending from at least some of the abutting raised and depressed portions of said strips, and securing said strips together, the pair of tongues in each said clasp being integral respectively with one of said strips and said strip adjacent thereto, and extending from the walls of aligned apertures through two of said abutting portions thereof, one foil tongue in each clasp extending from its corresponding foil strip through the aperture in the adjacent foil strip and thence being superimposed over the other of said tongues of each said clasp, the foil tongues in each of said clasps including portions having interengaging bends resisting separation of said tongues and separation of their corresponding foil strips, at least one of said clasps extending in a direction opposite to that of another of said clasps to resist separation of the corresponding raised and depressed portions.

---

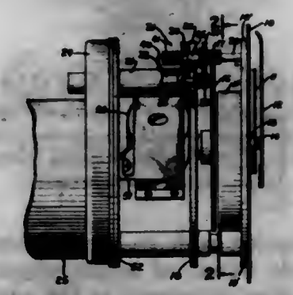


2,772,758
LEADED GLASS PANES
Joannes Franciscus Hubertus Vaessen, Vught, Netherlands
Application August 28, 1953, Serial No. 377,190
Claims priority, application Netherlands September 6, 1952
3 Claims. (Cl. 189—77)

1. A corner joint for two strips of thermoplastic supports for windowpanes and the like, said supports being H-shaped and supporting the edge of a pane between the legs of the H, comprising the end of one of said strips inserted between the legs of the H of the other of said strips to form a depression between the outside surface of said one strip and the ends of the legs of the other said strips, said one strip being heat bonded between the legs of the H of said other strip, a filler of molten resin in said depression, and a layer of low melting point plastic solder over said filler and the adjacent portions of said strips.

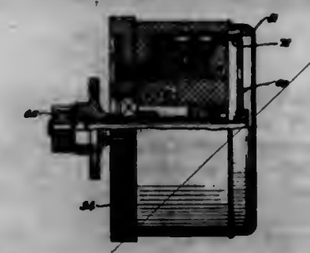
---

2,772,759
PROPULSION CONTROL SYSTEM
Donald Cameron Hankin, Rancocas, N. J., assignor to RTC Shipbuilding Corporation, Camden, N. J., a corporation of New Jersey
Application March 21, 1952, Serial No. 277,865
8 Claims. (Cl. 192—.098)



1. In apparatus of the character described, the combination with an internal combustion engine, a driving member operable by said engine, a pair of driven members, and throttle mechanism controlling the supply of fuel to said engine, of fluid operable clutching mechanisms for connecting said driving member with the respective driven members, valve mechanism controlling the fluid pressure actuating one of said clutching mechanisms, means responsive to the fluid pressure actuating the other of said clutching mechanisms for controlling said valve mechanism, a second valve mechanism controlling the fluid pressure actuating said last named clutching mechanism, means responsive to the fluid pressure actuating the said first named clutching mechanism for controlling said second named valve mechanism, and latching means including mechanism responsive to fluid pressure actuating either of said clutching mechanisms for limiting the movement of said throttle mechanism.

---



2,772,760
TRANSMISSION DEVICE
Loisius J. A. Van Lieshout, Bethlehem, Conn., assignor to Consolidated Electronics Industries Corp., Waterbury, Conn., a corporation of Delaware
Application August 1, 1955, Serial No. 525,435
11 Claims. (Cl. 192—4)

1. A transmission device for drivingly connecting a driving member and a driven member which comprises a support mounted for pivotal movement, a transmission member mounted on said support and in engagement with said driving member and engageable with said driven member upon pivotal movement of said support in one direction, a brake member fixedly secured to said driven member, a brake mounted on said support and engageable with said brake member upon pivotal movement of said support in the other direction, means normally maintaining said support in its pivoted position in which said brake is in engagement with said brake member and said transmission member is out of engagement with said driven member, and means for pivoting said support to a position so that said brake is out of engagement with said brake member and said transmission member is in engagement with said driven member.

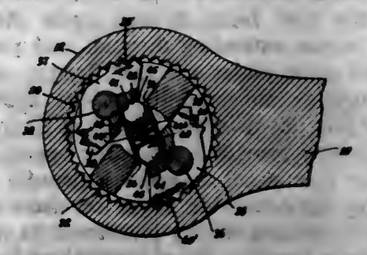
2,772,761
ELECTROMAGNETIC CLUTCH WITH PARTICULATE CLUTCHING MEDIUM
Gunnar H. Jansen, Grand Rapids, Mich., assignor to Lear, Incorporated, Grand Rapids, Mich.
Application December 17, 1951, Serial No. 262,027
11 Claims. (Cl. 192—21.5)

1. An electromagnetic clutch including a driving element adapted for connection to a source of power and a driven element, both elements being mounted for relative rotation and having opposed face portions defining a magnetic gap, means for establishing a magnetic field in said gap, and material in said field and responsive thereto for establishing a load transmitting bond between said face portions, said material comprising finely divided magnetically susceptible particles and a colloidal suspension of graphite in a vehicle comprising an alkyd resin.

---

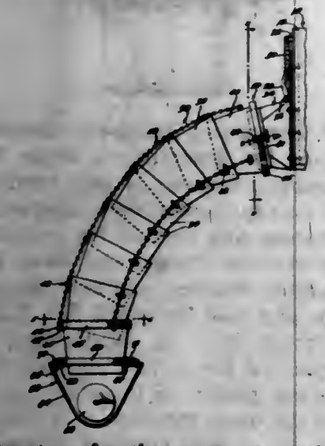


2,772,762
MAGNETIC DRIVE
Reynold F. Gemmell and George R. Pipes, Mayfield Heights, Ohio, assignors to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application February 17, 1953, Serial No. 337,404
10 Claims. (Cl. 192—21.5)

1. A clutch comprising relatively rotatable magnetic members, means for generating a single flux field between the members, portions of said rotatable members having a fixed air gap therebetween, magnetic means supported for rotation with one of the rotatable members and relatively movable toward and away from another portion of the other member, and fluid magnetic material in the fixed air gap, said generated flux field passing between the members across the fixed air gap and between the means supported for relative movement toward and away from the one portion of the other member, and the one portion of the other member, in a single continuous path providing for a dual coupling action between the members.

---

2,772,763
RATCHET WRENCH
Walter J. Johnson, Buffalo, N. Y., assignor to J. H. Williams & Co., Buffalo, N. Y., a corporation of New York
Application January 12, 1951, Serial No. 205,626
4 Claims. (Cl. 192—43.1)

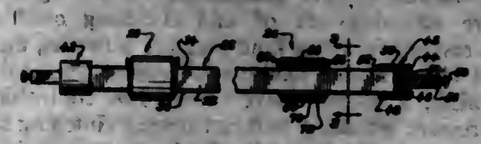


1. In a ratchet mechanism, the combination of a driving member having an internally toothed wall, a driven member rotatively mounted in the driving member, two double-ended, multi-toothed pawls journaled on shafts substantially diametrically opposite each other mounted in the driven member and parallel to the axis thereof for selective coaction with the teeth on the driving member, the teeth on one end of one of the pawls being normally in engagement with the teeth on the driving member while the teeth on the corresponding end of the other pawl are offset one-half tooth pitch in relation to the teeth on the driving member, resilient means biasing the pawls to the aforementioned positions, a shifter bolt rotatably and coaxially mounted in the driven member and supporting the resilient biasing means, manually operable means for rotating the shifter bolt to selectively en-

gage the teeth on one end of the pawl with the teeth in the driving member and the teeth on the corresponding end of the other pawl into offset relation, the shifter bolt having integral abutments for mechanically engaging and moving the pawls about their shafts, for reversing the operation of the wrench, when the shifter bolt is manually rotated, the driven member having a hub formed with segmental slots therein to provide pairs of flanges within which the shafts of the pawls are journaled, and a recessed gland mounted in the top of the driving member providing a bearing for the driven member and serving as a reinforcement for the upper flanges to interrupt and retard the expansive forces of the upper flanges at the pawl-shaft journals, which forces otherwise would be transmitted directly to the driving member.

---

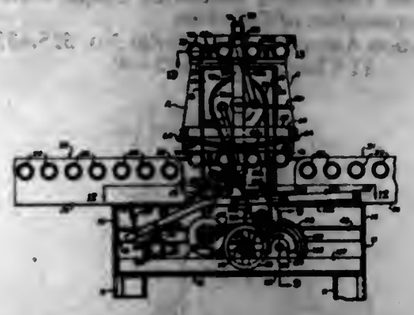
**2,772,764**
**GRAIN UNLOADER**
**David B. McClellan, Dutton, Mont.**
**Application September 3, 1953, Serial No. 378,206**
**1 Claim. (Cl. 193—4)**



A tailgate structure for the open rear end of the body of a vehicle, said body having bottom and side walls, said structure comprising a pair of upstanding posts secured to the rear ends of said side walls, a pair of vertically disposed base plates, each plate abutting the rear face of one post, a pair of guide plates, each guide plate abutting the rear face of one base plate, a rearwardly offset portion on each guide plate to provide with the associated base plate a pair of vertical opposed guide channels, a frusto-conical hood having edge flanges abutting the rear faces of said guide plates, common fastening means extending through said posts, said base plates, said guide plates and said flanges, said hood having an aperture substantially at the apex thereof, an outwardly and downwardly extending flange surrounding said aperture to provide a discharge opening, a generally rectangular gate panel disposed forwardly of said hood and having opposite side edges received in said guide channels for vertical sliding movement to close and open said discharge opening, rearwardly extending spaced ribs on said panel, gate panel operating mechanism mounted on said posts, links pivotally connected to said ribs and said mechanism and spaced notches in the upper edge of said hood for receiving said ribs to permit vertical movement of said panel by said mechanism.

---

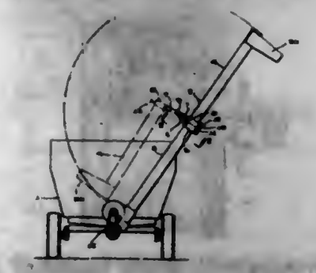
**2,772,765**
**BAIL FOR TYPEWRITERS AND THE LIKE**
**Arthur M. Mareth, Wilton, Conn., assignor to The J. J. Kennedy Corporation, Byram, Conn., a corporation of Connecticut**
**Application March 28, 1955, Serial No. 497,054**
**11 Claims. (Cl. 197—138)**



1. A cross-rod portion for the paper lock assembly of a typewriter and the like; said cross-rod portion comprising an elongated, rectangular bar of transparent plastic material, and thin metal strips extending along and adhered to two opposed surfaces of said bar to resist bend-

ing and warping of the latter about the neutral axis of the bar extending parallel to said two opposed surfaces, while permitting viewing of typed material through said bar in directions generally parallel to said neutral axis.

---



**2,772,766**
**ARTICLE INVERTING APPARATUS**
**James A. Kellam, Biscoe, N. C.**
**Application February 17, 1954, Serial No. 410,855**
**14 Claims. (Cl. 198—33)**

8. The combination with an article turning machine having a rotatable frame, of article gripping platforms mounted for relative movement in the rotatable frame, each platform comprising a row of idle rollers, said rows of rollers being adapted to engage opposite ends of an article, means to prevent rotation of at least one of the rollers in each platform in but one direction, links carried by the gripping frames and extending inwardly, a rotatable element mounted axially with respect to the rotatable frame but for movement relative to the rotatable frame and to substantially diametrically opposed points of which the proximal ends of said links are connected, friction means normally restraining rotation of said rotatable frame, and means under control of the article for effecting rotation of said rotatable element whereby said rotatable element will initially cause inward movement of said links and said gripping platforms until the inertia of said friction means is overcome and whereupon the rotatable element will then impart rotation to the rotatable frame for inverting the article.

---

**2,772,767**
**VEHICLE MOUNTED LOAD DISCHARGING ELEVATOR**
**Walter R. Seifert, Auburn, Ill., assignor to Hotchkiss Steel Products Co., Bradford, Ill., a corporation of Illinois**
**Application January 8, 1954, Serial No. 402,935**
**2 Claims. (Cl. 198—115)**

1. In a load discharging elevator for grain wagons and the like, a pair of tubular sections formed open at their opposite ends and adapted to be coaxially aligned in end-

abutting relation; auger conveyors extending within the respective sections; means connecting the conveyors for joint rotation in the aligned, end-abutting position of the sections; a pair of parallel links on each section, the links of each pair being rigid at one end with and extending laterally outwardly from the section on which they are mounted adjacent said one end of the section; a pin connecting the respective pairs of links at the other ends of the links to hingedly mount one section upon the other for swinging movement about an axis offset laterally from and extending transversely of the sections, said pairs converging in said position of the sections at an acute angle to each other in a direction away from the sections, to form a V-shaped brace straddling the abutting ends of the sections and reinforcing the sections against deviation from their coaxial relationship; and means releasably interengaging the sections against relative swinging movement in said coaxially aligned positions thereof.

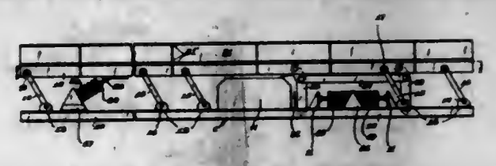
**ERRATUM**

For Class 198—192 see:
Patent No. 2,773,257

---

**2,772,768**
**BOX MACHINE CONVEYOR DRIVE**
**William J. Hogan, Dover, N. J., assignor to Stapling Machines Co., Rockaway, N. J., a corporation of Delaware**
**Application June 3, 1954, Serial No. 434,305**
**2 Claims. (Cl. 198—203)**



1. Means for driving the conveyor bands of a wire-bound box making machine comprising motor means, a primary train of drive elements mechanically connecting said motor means to said conveyor bands, said primary drive train having such a drive ratio as to cause said motor means to drive said conveyor bands at a predetermined basic speed and including an over-running clutch permitting said conveyor bands to be driven independently of said primary drive train at speeds in excess of said basic speed, and a secondary train of drive elements mechanically connecting said motor means to said conveyor bands, said secondary drive train including a clutch for rendering said secondary drive train ineffective to drive said conveyor bands and at least one adjustable element giving said secondary drive train a variable drive ratio to permit variation of the speed at which said conveyor bands are driven by said secondary drive train within a range of speeds in excess of said basic speed.

**2,772,769**
**SHAKER CONVEYING APPARATUS**
**George W. Behnke and Russell G. Westcott, Durand, Mich., assignors to Simplicity Engineering Company, Durand, Mich., a corporation of Michigan**
**Application May 9, 1955, Serial No. 506,904**
**6 Claims. (Cl. 198—220)**

1. In a shaker conveyor for transporting material in a given direction, a support structure, a conveyor pan above said structure, means pivotally connected to said structure and to said pan for supporting the latter above said support structure, depending lever means pivotally connected at one end thereof to said pan, eccentric means pivotally connected to said lever means interjacent its ends and at a point spaced to one side from a vertical plane passing through the point of connection of said lever means to said pan to oscillate the same, a frame member pivotally connected at the other end of said lever means and being movable relatively to said support structure, spring engageable means carried by said frame

member, and spring means reacting between said support structure and said spring engageable means opposing pivoting of said lever means about the point of its connection to said eccentric means to maintain said pan at a predetermined level above said support structure for a given load but permitting settling of said pan relative to the eccentric means with increased load to automatically increase the stroke of the pan.

---

**2,772,770**
**SHAKER CONVEYORS**
**Ernst R. Bergmann, Evergreen Park, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois**
**Application July 11, 1952, Serial No. 298,263**
**15 Claims. (Cl. 198—220)**

1. A shaker conveyor comprising an inby unit and an outby unit supporting a material conveying belt having reciprocating motion, a shaker drive mounted on one of said units for imparting reciprocating motion to said belt, fluid pressure means mounted on the other of said units and operable only upon the movement of said belt in a direction tending to buckle same for placing tension on said belt to prevent buckling thereof, and means actuated by the reciprocation of said belt for controlling said fluid pressure means.

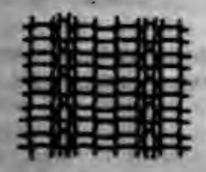
---

**2,772,771**
**DISPERSED GETTER ELEMENTS**
**Robert Joseph Wheldon, Cricklewood, London, Arthur Everard Widdowson, and Kenneth Herbert Wilkinson, Wembley, England, assignors to The M-O Valve Company Limited, London, England**
**Application July 14, 1955, Serial No. 522,008**
**Claims priority, application Great Britain July 23, 1954**
**5 Claims. (Cl. 206—.4)**

2. A dispersed getter element comprising a quantity of getter material, and an imperforate container in which the getter material is disposed and which is substantially completely closed at normal temperatures, the container being entirely constructed of materials whose melting points are higher than the volatilisation temperature of the getter material and at least two of which have different coefficients of thermal expansion, and the container including two parts which engage closely with one another at normal temperatures and which on heating to said volatilisation temperature expand differential-

ly to provide an opening between said two parts which allows the volatilised getter material to escape from the container.

---



2,772,772
**TABLET DISPENSER**
Eugene V. Taylor, Chicago, Ill.
Application April 29, 1954, Serial No. 426,438
2 Claims. (Cl. 206—42)

1. A tablet dispenser comprising a cylindrical body member having a plurality of longitudinal openings formed therethrough with the axes of the latter being spaced from the central axis of the body member, closure means at the lower end of said body member, each of said longitudinal openings being adapted to receive a plurality of tablets, said body member having apertures in the wall thereof communicating respectively with the longitudinal openings, a tubular dispensing head slidably and rotatably mounted on the lower end of said body member and having an aperture therein, an actuator member extending through the longitudinal center of said body member and said closure means, means connecting the lower end of said actuator member to said dispensing head, spring means mounted between said body member and said actuator for normally maintaining said dispensing head in a position where the aperture therein is out of register with the apertures in said body member, said actuator and dispensing head being manually rotatable relative to said body member so as to permit the aperture in the latter to be brought into alignment with any one of the longitudinal openings, and said actuator when manually depressed serving to shift said dispensing head axially relative to said body member for moving the aperture in the latter into register with the adjacent aperture in the body member so as to permit a tablet to drop from the selected opening in the body member and through the apertures in register upon tilting of the tablet dispenser.

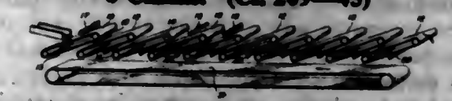
---

2,772,773
**FABRIC WRAP**
Raymond H. Pestell, Old Hickory, Tenn., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Application September 29, 1953, Serial No. 382,970
3 Claims. (Cl. 206—59)

1. Rib-knit wrap fabric containing both continuous-filament yarn and staple-fiber yarn and having ribbed wales of staple yarn separated from one another by pluralities of plain wales of the two types of yarn interknit with one another.

2,772,774
**TAPE ROLL AND CORE**
George R. Rabuse, St. Paul, Minn., assignor to Minnesota Mining & Manufacturing Company, St. Paul, Minn., a corporation of Delaware
Application March 19, 1953, Serial No. 343,431
2 Claims. (Cl. 206—59)

2. As a new article of manufacture, an assembly comprising an annular core having a roll of pressure-sensitive adhesive tape wound upon it, said assembly providing a tape roll which is resistant to lateral displacement of said tape on said core by reason of compression of the edge portions of said tape, the peripheral surface of said core being curved axially of the core so that the edge portions of said peripherial surface will be further inward, radially of the core, than the mid-portion thereof, whereby said adhesive tape, circumvolutely wound upon said core is supported only by said mid-portion of said core, the edge portions of said tape thereby being displaceable radially inward when compression occurs.



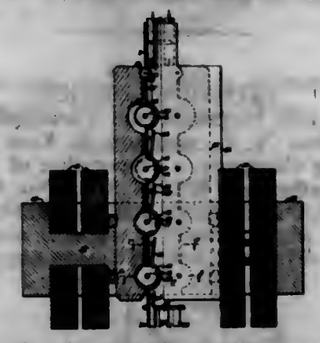
---

2,772,775
**TREATMENT OF SYLVINITE ORE**
George E. Atwood, Carlsbad, N. Mex., assignor to International Minerals & Chemical Corporation, a corporation of New York
No Drawing. Application March 2, 1953, Serial No. 339,917
13 Claims. (Cl. 209—11)

11. A process which comprises heating ore comprising sylvinite which contains slime-producing clays at a temperature above about 180° C., but below the fusion temperature, until the slime-producing materials are altered to hard, brittle, nondispersible materials, and recovering potassium-containing compounds from the resulting heat-treated ore.

---

2,772,776
**APPARATUS AND METHOD FOR SEPARATING FINES**
Thomas L. Myron, Pittsburgh, Pa., assignor to United States Steel Corporation, a corporation of New Jersey
Application January 7, 1954, Serial No. 402,725
8 Claims. (Cl. 209—45)

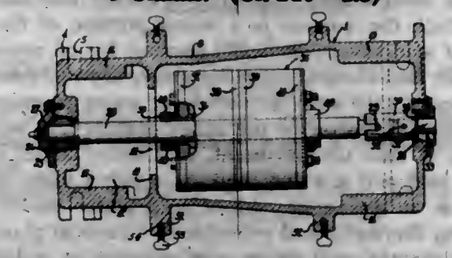


1. An apparatus for separating fines from wet granular materials comprising a series of power driven belt conveyors arranged in tandem with each spaced a minimum distance of about two feet above the conveyor which follows and having its discharge end located thereover, whereby material discharging from each conveyor tends to stratify according to size as it falls on the next conveyor, particle removing means mounted adjacent the lower flights of each of said conveyors for removing clinging fines therefrom, the downward projection of at least some of said particle removing means lying ahead of the next conveyor, means for collecting fines removed by said particle removing means, and means situated above and beyond at least one of said conveyors for directing air streams backwardly against material discharging therefrom.

---

2,772,777
**APPARATUS FOR MAGNETIC SEPARATION OF ORES**
Augustin L. J. Queneau, Far Hills, N. J.
Application October 20, 1954, Serial No. 463,394
5 Claims. (Cl. 209—219)

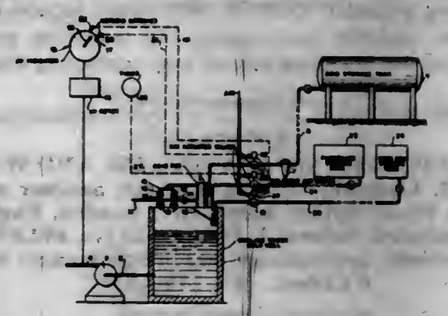
1. In an apparatus for the wet magnetic separation of materials consisting of mixtures of magnetically susceptible particles and magnetically non-susceptible particles, the combination which comprises a vertically-extending separator box having enclosing side and bottom walls for receiving and maintaining a liquid suspension of such material under a controlled hydrostatic head, means defining a restricted discharge opening in the bottom portion of said box through which to maintain a controlled discharge of a residue of such a liquid suspension, said box having opposite side walls provided with opposed inwardly extending arcuate recesses defining between them a relatively narrow flow passage for the liquid suspension



being treated therein, a pair of electromagnetic poles pieces positioned at opposite sides of said separator box and having arcuate recesses therein positioned in registering relation to the arcuate recesses in the side walls of said box, cylindrical end pieces mounted for rotation within said registering recesses, said arcuate recesses in said pole pieces being developed on radii of circles of a relatively large diameter as compared to the diameter of said end pieces, and semi-cylindrical sleeves of magnetic material fitting in seating engagement with the side walls of said pole piece recesses.

---

2,772,778
**UNIVERSAL MAGNETIC CLARIFIER**
George B. Furey, Lebanon, Ind., assignor to Indiana Commercial Filters Corporation, a corporation of Indiana
Application April 16, 1954, Serial No. 423,587
3 Claims. (Cl. 210—1.5)



1. In a magnetic clarifier, a tank having an inlet for contaminated liquid at one end and an outlet for cleaned liquid at the other end and through which the liquid flows lengthwise of the tank, a shaft extending through said tank lengthwise thereof for rotation in a direction substantially transverse to the direction of liquid flow, a magnetic pick-up drum of uniform diameter on said shaft, the side and bottom walls of the tank converging toward the outlet end, said drum being mounted on said shaft within the region encompassed by said converging walls.

---

2,772,779
**METHOD FOR pH CONTROL IN CIRCULATING WATER**
Donald E. Norris, Hammond, Ind., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine
Application January 29, 1952, Serial No. 268,862
2 Claims. (Cl. 210—29)

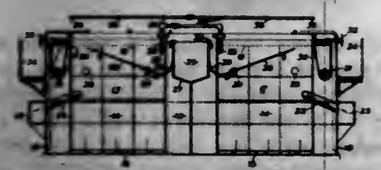
1. A method for control of pH in a continuously circulating stream of water containing polyphosphate corrosion inhibitors by the addition of aqueous acid solution thereto, which comprises continuously measuring the pH value of the circulating water, introducing aqueous acid solution at a regulated rate to the stream of water at a point upstream from the point at which the pH measurement is taken in a repeated cycle commencing when the pH attains a predetermined maximum value on the acid side and terminating when the measured pH is reduced to a predetermined intermediate value, introducing

aqueous sodium base solution at a regulated rate to the stream of water at a point upstream from the point at which the pH measurement is taken in a repeated cycle commencing when the measured pH attains a predetermined minimum value less than said intermediate value and terminating when the measured pH is raised to a predetermined value intermediate said maximum and minimum values, and introducing an aqueous solution of polyphosphates to the water stream at equally spaced intervals of time and selected duration.

---

2,772,780
**APPARATUS FOR CONTACTING LIQUIDS WITH GRANULAR SOLID MATERIALS**
Joe E. Penick, Woodbury, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application July 17, 1951, Serial No. 237,265
7 Claims. (Cl. 210—42.5)

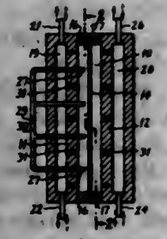
5. An apparatus for the continuous percolation of liquid through a downwardly moving bed of granular solids, which comprises in combination: an enclosed contacting chamber adapted to confine a bed of granular solids, a liquid plenum chamber beneath said contacting chamber, at least one short nipple for liquid flow extending upwardly from said plenum chamber into the lower section of said contacting chamber and removably attached to a wall of said plenum chamber, an orifice plate with flow restricting orifice therein extending laterally across said nipple, a deflecting baffle fixed centrally a spaced distance above the upper end of said nipple, a screen enclosing the space between said baffle and the upper end of said nipple, said screen being less in mesh size than said contact material, the area for liquid flow between said baffle and the adjacent end of said nipple



cleaning the cylindrical interior wall of the tank and wiper cover into separate filtrate chambers each having an in-

and the area for liquid flow between said baffle and the wall of said plenum chamber to which said nipple is attached and the total area of the openings in said screen each being greater than the area of said orifice in said orifice plate, means for introducing liquid into said plenum chamber whereby liquid flows from said plenum chamber through said nipple, orifice and screen into said contacting chamber, means for removing liquid from the upper section of said contacting chamber, means for introducing granular solids into the upper section of said contacting chamber and means for removing granular solids from the lower section of said contacting chamber.

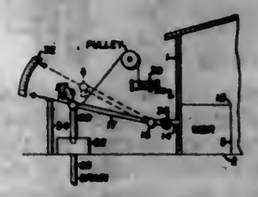
---



**2,772,781**
**APPARATUS FOR SEPARATING OIL AND WATER**
George R. Unthank, London, England, assignor of one-half to Henry Arthur John Silley, London, England
Application January 7, 1954, Serial No. 402,680
Claims priority, application Great Britain January 8, 1953
6 Claims. (Cl. 210—52)

1. Apparatus for separating oil and water comprising a tank, an open-topped, channel-section conduit for discharging liquid into the tank and disposed in the upper part of the tank, at least one of the conduit side walls providing a weir over which liquid entering the tank from the conduit must flow, discharge means for oil which separates from the liquid in the tank and which collects in the upper part of the tank between said open-topped conduit and said discharge means, a primary partition wall disposed closely adjacent at least one tank side wall and providing a first passage which is open at its lower end into the tank adjacent the tank floor to permit flow into the first passage of water from the lower part of the tank, the primary partition wall providing at its upper end a first weir over which water flowing upward in the first passage passes, discharge means for water which has passed over the said first weir, and at least one baffle extending from the side wall of the open-topped conduit toward said oil discharge means, the smaller part of said baffle nearer to the open-topped conduit being shaped to direct the downward flow of liquid passing over the conduit side wall in an outward direction toward said oil discharge means, and the greater part of said baffle further from the open topped conduit being perforated to allow the water to separate from the oil and sink to the bottom of the tank and flow into said first passage.

---

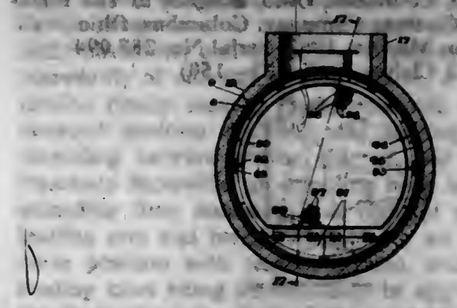


**2,772,782**
**LIQUID THERMAL DIFFUSION APPARATUS AND METHOD**
John C. Jansma, Maple Heights, Ohio, assignor to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio
Application April 28, 1953, Serial No. 351,528
6 Claims. (Cl. 210—52.5)

1. Liquid thermal diffusion apparatus comprising an elongated separation chamber formed by closely spaced, substantially parallel, liquid-impervious, opposed walls, means for relatively heating one of said walls and cooling the other of said walls to maintain a temperature gradient across the separation chamber, an inlet for introducing a liquid mixture into the chamber, said inlet extending into said chamber and terminating intermediate the chamber-forming walls, and a plurality of outlets in and extending substantially across said opposed walls and spaced from said inlet for withdrawing liquid fractions from said separation chamber at locations closely adjacent the chamber-forming walls.

---

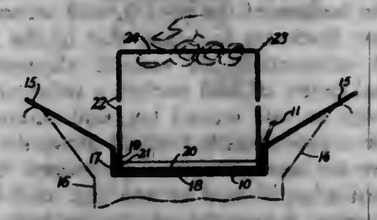
**2,772,783**
**SKIMMING DEVICE**
William C. Ludi, Matawan, and Christopher E. Loeser, Scotch Plains, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Application July 9, 1954, Serial No. 442,274
1 Claim. (Cl. 210—60)



An apparatus for separating and separately withdrawing oil from a mixture of oil and water, comprising a receiving vessel for a batch of said mixture, wherein the oil and water are separated from said batch by gravity to form a superposed layer of the oil on the water, a weir plate having parallel and opposite longitudinal upper and lower edge portions, and end edge portions, said plate being secured along its lower edge portion to the floor of said vessel, and extending upwardly therefrom to a height at its upper edge portion which is a minor portion of the height of said vessel, said weir plate being secured at each end edge portion to a wall of said vessel and therewith defining a compartment, opening upwardly into said vessel, of which the volume is a minor portion of the total volume of said vessel, an outlet conduit for oil communicating with said compartment interiorly thereof below the upper edge of said weir, an outlet for water communicating with said vessel below the upper edge of said weir and exteriorly of said compartment, said water outlet having an outer end and a valve therein, a swing joint conduit connection at the outer end of said water outlet communicating therewith and movable in a vertical plane with reference thereto, said swing joint connection including a discharge end and vacuum breaker means adjacent said end, a stop support for said swing joint conduit connection disposed exteriorly of said vessel to engage said swing joint conduit and support said discharge end thereof at a depressed level thereof substantially in a plane common to the upper edge of said weir, and means for elevating said swing joint conduit discharge end to, and for retaining said end at a level above said weir substantially equal to the thickness of a layer of oil separated from and superposed on a layer of water in said vessel.

---

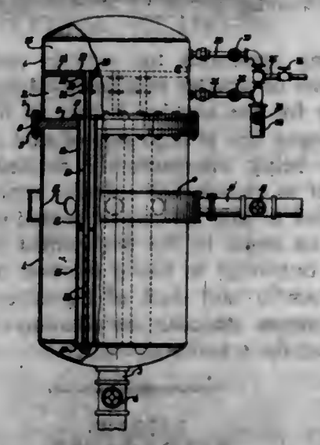
**2,772,784**
**TANK FOR TRANSPORTING VISCOUS LIQUIDS**
James F. Cyphers, Milton, and Francis C. Doherty, Jamaica Plain, Mass., assignors to General Foods Corporation, New York, N. Y., a corporation of Delaware
Application December 30, 1952, Serial No. 328,782
15 Claims. (Cl. 210—206)



1. In a portable substantially cylindrical tank unit having a bottom outlet, cleanout means inside the tank including ring-like wiper means movable axially therein for cleaning the cylindrical interior wall of the tank and wiper means rotatable in engagement with an end wall of said

tank, and operating means outside of said tank having driving connections to said cleanout means therein.

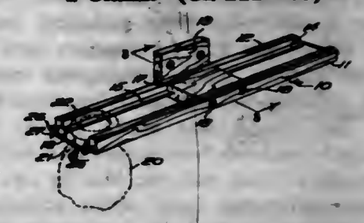
---



**2,772,785**
**MILK FILTER OR THE LIKE**
Lewis L. Kramer, New York, N. Y.
Application August 17, 1954, Serial No. 450,321
3 Claims. (Cl. 210—158)

7. In a filter assembly comprising a funnel or reservoir having a filter seat and superimposed strainers for holding a milk filter on said filter seat, the combination therewith of a filter sheet of the class consisting of milk filter paper, carded cotton milk filter sheets and carded cellulose milk filter sheets including a body portion and a border anchored by one of said strainers, said body portion having a gripping tab projecting to one side of a strainer and severable while holding the strainer in position, whereby the contaminating influence in contacting the tab may be removed before filtering.

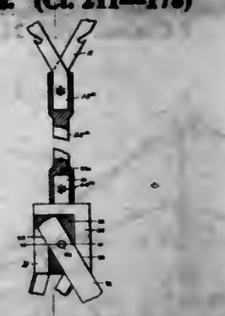
---



**2,772,786**
**OUTLET ARRANGEMENT FOR BLOW-DOWN CLARIFIER**
Alfred W. Gardes, Lebanon, Ind., assignor to Indiana Commercial Filters Corporation, a corporation of Indiana
Application February 16, 1953, Serial No. 337,068
4 Claims. (Cl. 210—182)

1. In a liquid clarifying apparatus, a casing having an inlet for contaminated liquid, a removable inverted cup-like cover on said casing, a transverse partition in the middle region of said cover and a transverse partition adjacent the lower end of said cover, said partitions dividing the cover into separate filtrate chambers each having an individual outlet, an elongated filter in said casing comprising upper and lower transversely separated filter elements of which the upper extends through the lower partition and discharges into the lower filtrate chamber, and a pipe extending through said elements in communication with the lower element only and also extending through the upper partition whereby the lower element discharges into the upper filtrate chamber.

---

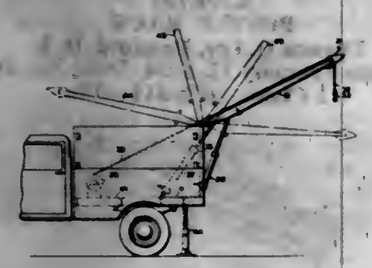


**2,772,787**
**BOTTLE RACK**
Thomas O. Lee, Rumford, R. I.
Application February 12, 1954, Serial No. 409,941
1 Claim. (Cl. 211—75)

A bottle holder comprising a pair of uniformly spaced arms, a lip along the length of each arm extending inwardly toward the other arm, a spacer block midway of the length of said arms and secured to said arms to provide an H-shaped frame with open ends to receive a bottle neck between the arms from either side of said block, a bracket secured to the outer edge of one arm at the location of said block for supporting the holder and leaving the ends open for positioning bottles therein from either side.

---

**2,772,788**
**LAUNDRY OR CLOTHES RACK**
Walter L. Gill, Redlands, Calif.
Application September 15, 1954, Serial No. 456,214
6 Claims. (Cl. 211—178)

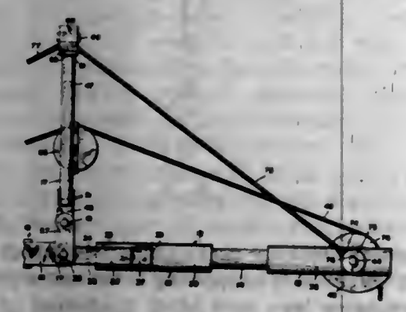


1. A uniting block for racks of the type which comprise a plurality of garment supporting arms and a plurality of separate swinging legs, said block consisting of a polygonal unitary member which in horizontal cross section presents a plurality of external flat faces indented to provide recesses over a portion of their interior areas and leaving outstanding stop edges at the juncture of the indented portions, and integral studs outstanding from said indented areas and so positioned with respect to said ledges that legs pivoted upon said studs will be limited by said ledges in their outward swinging movement, to lie at an angle to support said block.

---

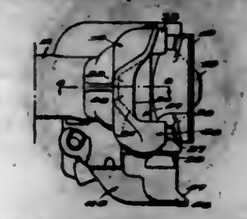
**2,772,789**
**BOOM LIFTING DEVICE**
James C. Hunsong, Pikesville, Md., and Kirwan Y. Mesick, Arlington, Va., assignors to Thompson Trailer Corporation, Pikesville, Md., a corporation of Virginia
Application October 28, 1954, Serial No. 465,312
4 Claims. (Cl. 212—8)

1. In a lifting device comprising first and second spaced apart supporting means, a first boom pivotally mounted



at an upper portion of said first supporting means, a second boom pivotally mounted at an upper portion of said second supporting means, said booms being joined radially outward from their pivot points, first and second single acting hydraulic lift means respectively pivotally mounted in association with lower portions of said first and second supporting means and with said first and second booms, said first hydraulic lift means being mounted on its supporting means at a point to a first side of the vertical plane of the boom pivot points so that when the first hydraulic lift means is fully extended

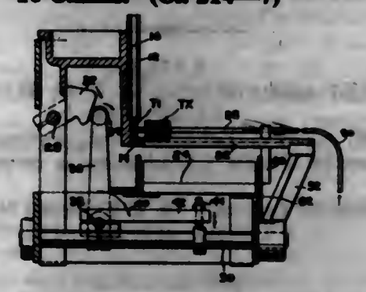
the booms' center of gravity is to a second side of the vertical plane of the boom pivot points, said second hydraulic lift means being mounted on its supporting means so that when the second lift means is fully extended the center of gravity of the booms is to the first side of the vertical plane of the boom pivot points, said first and second hydraulic lift means being effective to move the booms back and forth between an approximately horizontal position on the first side of the boom pivot points to an approximately horizontal position on the second side of the boom pivot points.



---

**2,772,790**
**VARIABLE LENGTH BOOM EXTENSION**
Roy D. Kaufman, Washington, D. C.
Application May 9, 1955, Serial No. 506,740
7 Claims. (Cl. 212—144)

1. A boom extension comprising an extension assembly composed of three separable sections, and a support assembly for maintaining the extension assembly sections in proper relationship on an associated boom, said extension assembly including a base section adapted to be pivotally connected to the end of a boom, an end section, and a tubular intermediate section telescopically and rotatably received in both the base and end sections and spacing them apart, said support assembly having its lower end connected to said base section and having an anchor post at its upper end, there being first and second cable means connecting said anchor post respectively to said end section and to the associated boom, the first cable means consisting of a length of cable secured at its opposite ends to the end section and passing freely over said anchor post to permit said end section to twist relative to the intermediate and base sections without imparting torsional stresses thereto.



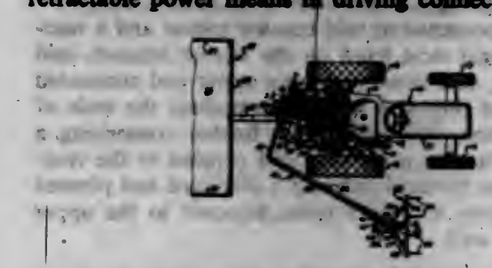
**2,772,791**
**RAILWAY COUPLER**
Harry H. Wolfe, Columbus, Ohio, assignor to The Buckeye Steel Castings Company, Columbus, Ohio
Application May 16, 1952, Serial No. 288,094
3 Claims. (Cl. 213—150)

1. In an interlocking type railway coupler, a coupler head having a guard arm thereon, a knuckle mounted for pivoting movements on the coupler head, an aligning wing projection extending forwardly of the guard arm terminating in a wedge-shaped nose portion, means at the other side of the knuckle providing an aligning wing pocket on the coupler head including a bottom wall and an outboard wall, a lug carried by the coupler head at the top of said pocket, a second lug carried by the coupler head at the bottom of the pocket, said second lug having a transverse thickness less than that of the first lug and positioned substantially in vertical alignment with the longitudinal center of said pocket, a substantially vertical forward edge on said second lug, said outboard wall terminating in a substantially vertical forward edge immediately above the second lug and positioned rearwardly of the forward edge of said second lug, said bottom wall being cut-away outwardly of the second lug, a shelf carried by the coupler head below the knuckle, and a third lug projecting forwardly from the shelf between a vertical plane defined by the longitudinal center of the coupler head and a vertical plane extending through the second lug.

---

**2,772,792**
**COUNTING AND STACKING TABLETS**
Elno E. Lakso, Fitchburg, Mass.
Application July 10, 1953, Serial No. 367,250
16 Claims. (Cl. 214—7)

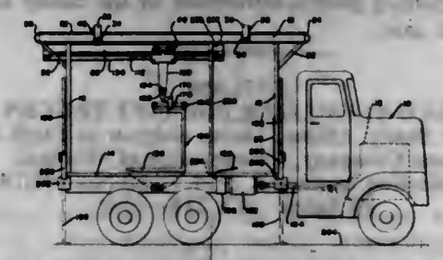
7. Stacking apparatus for articles comprising means guiding a line of articles in edge-to-edge contacting relation, a stop for the articles, a pair of toothed counting wheels arranged one at each side of said stop, said counting wheels being intermittently rotated to cause the teeth thereof to engage and transfer seriatim a predetermined number of said articles from said stop into stacked relation at an angle to the first-named line of advance, and means operating in timed relation to said counting wheels to transfer said stack of a predetermined number of articles, means stopping the rotation of said counting wheels during the transfer operation.



---

**2,772,793**
**BALE LOADER**
Reinhard C. Brunewitz, Bagley, Minn.
Application January 13, 1954, Serial No. 403,860
5 Claims. (Cl. 214—42)

1. A bale loading device for picking up bales and the like from the ground beside a traveling vehicle such

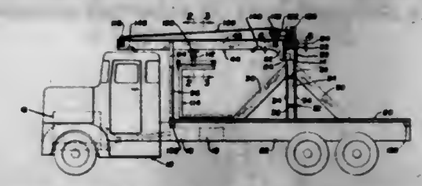


as a tractor and depositing them on a transporting apparatus drawn at the rear of said vehicle, said bale loading device comprising a rotatable shaft journaled substantially horizontal and angulated outwardly and somewhat rearwardly of one side of said vehicle, a loading arm extension rigidly secured to the rotatable shaft and at an outward position thereon, said loading arm normally extending forward at the side of said vehicle and in clearance therewith, an impaling head having forwardly extending tines mounted at a forward position on said loading arm and being swingable to an upwardly transverse position with respect thereto, said forwardly extending tines being substantially in alignment with said longitudinal center line of the traveling vehicle in its normal lowered position so that said tines can engage a bale and the like in impaling relation, extensible and retractable power means in driving connection with said

shaft for rotating the shaft through an arc and thereby swinging said loading arm upwardly and rearwardly toward a medial area of the transporting apparatus, resilient means interposed between said loading arm and said impaling head urging said impaling head into general alignment with the loading arm, and abutment means operably associated with said extensible and retractable power means for limiting the movement of said loading arm in its upward and rearward travel so as to stop the arm together with a bale impaled on said tines in upstanding relation in its rearwardmost travel toward the medial area of said transporting apparatus, whereby the momentum of said bale will cause said impaling head to be swung against the influence of said resilient means to permit ejection of the bale in the direction of said medial area of the transporting apparatus.

---

**2,772,794**
**MATERIAL HOISTING AND HANDLING MECHANISM FOR VEHICLE**
George L. Cramer, Amos Raffensberger, and Eli R. Strine, York, Pa., assignors to Side-O-Matic Unloader Corporation, York, Pa., a corporation of Pennsylvania
Application March 30, 1954, Serial No. 419,644
18 Claims. (Cl. 214—75)



1. In combination with a vehicle, material hoisting and handling mechanism comprising a pair of substantially parallel track members extending substantially in spaced parallel relationship to each other and the bed of said vehicle, means adjacent opposite ends of and extending above said bed means supporting said tracks fixedly in elevated position above said bed, a frame extending between said track members substantially within the plane thereof and movable longitudinally along said members, means operable to propel said frame along said track members, a circular track member connected

to said frame substantially within the plane thereof, the interior of said circular track being substantially unobstructed, an auxiliary frame extending substantially diametrically across said circular track and supported at its ends within said track by rollers engaging said track for movement within the plane of said track and about the axis thereof, a boom extending along and fixed to the underside of said auxiliary frame and at one end projecting therebeyond to comprise a cantilever type extension, a sheave supported by rollers for movement along said boom and depending therefrom, a hoisting cable supported by said sheave and movable relative thereto, a hoisting drum mounted on said auxiliary frame and around which said cable is coiled for actuation thereby, drive means for said auxiliary frame carried thereby and including gears rotatable at opposite ends of said frame engageable with means on said circular track, power energizable prime movers carried by said auxiliary frame and respectively operable selectively to drive said sheave along said boom and actuate said hoisting drum and rotate said auxiliary frame and boom about the axis of said circular track, a sheave supported by said hoisting cable, load supporting means, frame-like means connected to said load supporting means and spaced thereabove in normal use position, and means depending from said sheave on said hoisting cable and adjustably carried by said frame-like means for movement selectively within a normally substantially horizontal plane in directions substantially transverse to each other, whereby said sheave on said hoisting cable may be positioned vertically above the center of gravity of a load on said load supporting means.

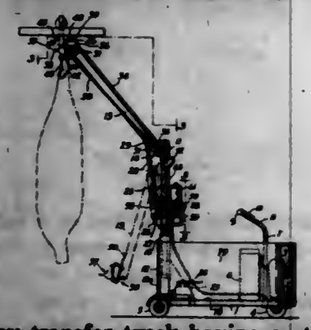
---

**2,772,795**
**SELF-LOADING VEHICLE HOIST**
George L. Cramer, Amos Raffensberger, and Eli R. Strine, York, Pa., assignors to Side-O-Matic Unloader Corporation, York, Pa., a corporation of Pennsylvania
Application October 8, 1954, Serial No. 461,262
12 Claims. (Cl. 214—75)

1. A hoist attachable to the bed of a vehicle and comprising in combination a hollow mast having a cylindrical upper portion and constructed and arranged to be fixed at its lower end to said vehicle bed and extend vertically upward therefrom, a substantially relatively short cylindrical bracing sleeve concentrically surrounding and extending downward from the upper end of said mast in spaced relationship thereto, two sets of anti-friction rotating members positioned within the space between said sleeve and mast respectively adjacent opposite ends of said sleeve, a cantilever boom having one end abutting said bracing sleeve, means rigidly connecting said abutting end of said boom to said sleeve adjacent the upper end thereof and said boom extending substantially horizontally outward from said sleeve, said boom having a cross-sectional heighth less than the length of said sleeve, a compact bracing bracket extending between the lower surface of said boom and the lower end of said sleeve and secured thereto, mast-bracing members extending angularly outward and downward from said mast directly beneath the lower end of said sleeve and connected at the lower ends thereof to the bed of said vehicle, the height of said mast and position of said boom on said bracing sleeve affording clearance for said boom above a load of material upon said vehicle bed when loaded and said bracing sleeve and connecting means constituting the sole

means preventing tilting of said boom relative to said mast, a load supporting sheave mounted upon said boom for longitudinal movement therealong between the ends thereof, and means interconnected to said boom and sleeve and operable to rotate the same in either direction about the axis of said mast.

---

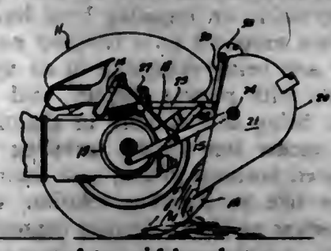


2,772,796
**WAGON UNLOADER**
Elmer K. Hansen, Sioux City, Iowa
Application May 27, 1955, Serial No. 511,484
7 Claims. (Cl. 214—83.14)

1. A material unloading device for a container having a bottom wall and side walls, said device including a plurality of substantially horizontal vertically aligned shafts extended across one end of said container, flipper members carried by said shafts, a conveyor mounted in said container adjacent said bottom wall for delivering material to said flipper members, power means for rotating said shafts and moving said conveyor, and clutch means operatively associated with said power means and said conveyor operable to transmit variable power to said conveyor only during rotation of said shafts.

---

2,772,797
**TROLLEY TRANSFER TRUCK**
Irvin F. Schrock, South Euclid, Ohio
Application June 8, 1954, Serial No. 435,114
8 Claims. (Cl. 214—132)



1. In a trolley transfer truck having a steering means and a reversible propelling mechanism, the combination therewith of a mast mounted on said truck to turn about a vertical axis, an operator's platform adjacent the base of said mast, a boom pivoted to said mast to swing about a horizontal axis, a trolley engaging fork pivoted to said boom at its outer end for lateral swinging movements, manually controlled means for raising and lowering said boom and holding it in adjusted position, and a manually operable actuating member attached to said fork and extending along said boom to within reach of the operator on said platform for swinging said fork laterally on said boom to aline a trolley carried by said fork with an overhead track.

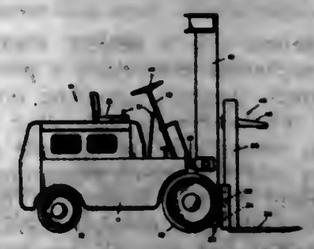
---

2,772,798
**AUTOMATIC DUMP MECHANISM FOR A SCOOP**
Robert W. McClenny, Suffolk, Va.
Application December 15, 1953, Serial No. 398,366
2 Claims. (Cl. 214—140)

1. In combination, a tractor having lift arms and means for elevating and depressing said lift arms, a pair of supporting arms having forward ends pivoted to the tractor and rearward ends, a scoop having side walls, a bottom wall, and a rear wall having an upper end, means pivoting the rearward ends of the support arms to said side walls, links extending between and pivoted to said lift arms and intermediate portions of the supporting arms, bracket means fixed on the tractor at a level above said supporting arms, link means comprising a forward link having a

forward end connected to said bracket means and a rearward end, a rigid strut fixed on the tractor beneath said bracket means, said strut having an upper end connected to said forward link at a point intermediate the ends of said forward link, said link means further comprising a rearward link having a forward end pivoted to the rearward end of the forward link and a rearward end pivoted to the scoop rear wall at a point adjacent to the upper end of the rear wall.

---



2,772,799
**BOAT LOADER**
Leon J. Brininger, Lansing, Mich.
Application January 16, 1953, Serial No. 331,617
1 Claim. (Cl. 214—450)

A boat loading device for use with a vehicle comprising a vertical upright rigidly secured to a bumper of said vehicle, a clamp provided with swiveling connection means between the clamp and the upright permitting rotation of the clamp about a vertical axis, said clamp having means adapted to engage the stern wall of a boat preparatory to swinging the boat to rest its position upon the roof of a vehicle, said swiveling connection means including a shaft depending from the clamp structure, said upright being in the form of a tube for receiving the shaft, said shaft being rotatable about a vertical axis of the tube, and hinge means connecting the clamp and the shaft permitting pivotal movement of the clamp about a horizontal axis.

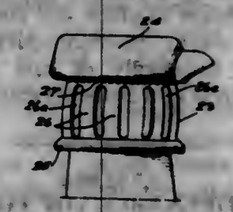
---

2,772,800
**LOAD STABILIZER FOR LIFT TRUCKS**
Joseph L. Brady, Albion, Mich., assignor to Clark Equipment Company, a corporation of Michigan
Application January 7, 1954, Serial No. 402,791
8 Claims. (Cl. 214—654)

1. For use with an industrial truck having an upwardly and downwardly movable load supporting carriage and

forwardly projecting load carrying means secured to the load supporting carriage, the combination of vertical frame means secured to the load supporting carriage, normally forwardly projecting horizontal load engaging means vertically movable in said frame means above the load carrying means for engaging the upper portion of a load supported by the load carrying means, means for vertically moving said load engaging means within said frame means, and means carried by said frame means for automatically swinging said load engaging means to a substantially vertical non-load-engaging position upon lowering of the latter below a predetermined point.

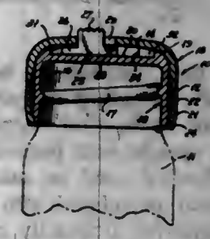
---



2,772,801
**BABY BOTTLE PROTECTIVE HARNESS**
Jesse Schwartz, Bronx, N. Y.
Application October 28, 1954, Serial No. 465,290
2 Claims. (Cl. 215—11)

2. A holder for a nursing bottle comprising an outer and an inner ring spaced from one another and adapted to extend about a nursing bottle, side strap members connected to and extending between the rings to extend longitudinally of said bottle, and retaining means extending from the outer ring and adapted for connection to an adjacent support, the strap members being integral at one end with the outer ring, and being overlapped with one another and connected at the location of said overlapping at their other ends, the inner ring being formed with a circumferential series of slits, the several strap members being extended through the slits of the inner ring intermediate the ends of the strap members, said retaining means being formed as an elongated strip integral at one end with said outer ring.

---



2,772,802
**REUSABLE BOTTLE STOPPER WITH SEVERABLE SKIRT PORTION**
Leszek Weydatt and Rodolphe Chwialkowski, Paris, France
Application October 26, 1951, Serial No. 253,286
Claims priority, application France October 27, 1950
1 Claim. (Cl. 215—41)

A unitary closure device for a receptacle having a neck with a rim defining a mouth, comprising a cup-shaped cap portion having a side wall for covering and surrounding said rim of said neck and having a base for closing said mouth, said side wall adjacent the junction thereof with said base being thinner than at its edge remote from said base, a skirt portion having a main central section of substantially uniform wall thickness less than the thickness of said edge of said side wall, said skirt portion further having a first edge section of lesser wall thickness than said central section and a second edge section of greater wall thickness than said central section, said first edge section of said skirt portion being joined to said edge of said side wall and thus forming a prolongation of said side wall, said skirt portion being constructed to fit around said neck below said rim thereof and being provided with a plurality of substantially parallel longitudinal slots in said central section, said slots extending approximately from said first edge section to said second edge section, whereby the flexibility and thus the neck-embracing characteristics of said skirt portion are materially enhanced, a substantially hollow cylindrical member protruding from said base of said cap portion and positioned interiorly of and concentrically with said side wall and said skirt portion, whereby an annular groove is defined between the outer surface of said cylindrical member on the one hand and the inner surface of said side wall and said skirt portion on the other hand, said groove being shaped to receive said rim of said receptacle upon positioning of said cap portion on said neck and upon insertion of said cylindrical member into said mouth, said cylindrical member extending from said base of said cap portion to a location beyond the junction between said edge of said side wall and said first edge section of said skirt portion, and a lug attached to and extending from the outer surface of said side wall at a location substantially adjacent said edge thereof, said lug being provided with a pressure surface essentially directed toward said second edge section of said skirt portion, whereby upon application of pressure against said pressure surface of said lug and in a direction toward said base said first edge section of said skirt portion will be ruptured to enable said cap portion together with said cylindrical member to be severed from said skirt portion and removed from said receptacle and retained for reuse with the latter without said skirt portion.

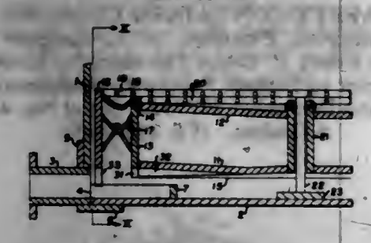
2,772,803
**SAFETY CONTAINER CLOSURE**
James Pasquariello, Paterson, N. J., assignor of twelve percent to Frank P. Bello, Paterson, N. J., and twenty-eight percent to Robert Poganik, Bridgeport, Conn.
Application December 27, 1954, Serial No. 477,770
4 Claims. (Cl. 215—43)

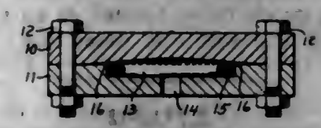


1. A safety cap for containers having an externally threaded neck comprising: a first, outer cup-like member having a transverse upper end, a second, inner cup-like container neck engaging member having a transverse upper end telescoped within the first member with the closed ends of each member confronting each other, said second member having a thread engaging means on its inner side wall, means rotatably connecting the two members against separation, the transverse upper end of the second member having a large central recess in its upper surface, a dog mounted in said recess for reciprocation radially thereof, means retaining the dog from rotation with respect to the first member, the wall of the recess having at least one dog receiving depression, and thumb-engageable operating means having a stem rectangular in section connected to the dog and projecting through an elongated opening in the transverse wall of the first member in which the stem fits slidably but non-rotatably to move the dog into and out of said depression.

2,772,804
MAGNETIC STOPPER
John J. Byrnes, Newark, N. J.
Application August 16, 1954, Serial No. 449,827
6 Claims. (Cl. 220—24)

1. A device for stopping the flow of a fluid from holes or openings in metal tanks, pipes and other containers or conductors, comprising in combination two permanent magnets spaced laterally from each other and having flat pole faces, an elongated member having it ends fastened to the central portions of the magnets to normally hold the pole faces of the magnets in a single plane, said member being a strip of resilient sheet metal which may bow longitudinally and flex laterally, a nut at the center of said member and a stopper-actuating screw threaded through said nut.

2,772,805
FLOATING ROOF LIQUID STORAGE TANK STRUCTURE
Henry Grundig, Elizabeth, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application December 14, 1954, Serial No. 475,226
7 Claims. (Cl. 220—26)

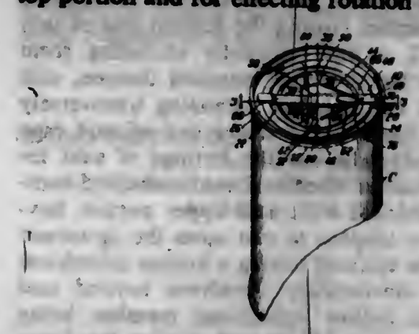


1. In a storage tank, including a bottom wall, a cylindrical upright wall extending upwardly from said bottom wall, a conduit connection nozzle opening into said tank through said upright wall immediately adjacent said bottom wall, a floating roof in said tank, including a floor and a vertical peripheral rim portion, said roof adapted to be supported primarily on the surface of a liquid contained in said tank, and thereon to be positioned at various levels within the tank as said liquid is introduced and withdrawn, said roof also including rigid support means extended downwardly from said floor adapted to establish a lower most position for said roof at a level which is below a horizontal plane tangent to said nozzle and in vertically spaced relation to the tank bottom wall, a vertical sealing ring resiliently supported on said roof rim in substantially parallel radially spaced relation thereto and in substantially fluid tight surface contact with the inner surface of the tank wall, an arcuate notch portion extending upwardly in said ring, an arcuate notch portion extending upwardly in said rim, and a channelled course defined in the roof floor opening downwardly therefrom, said channeled course extending radially inward from said rim and coincident at its outer end with said rim notch portion, each of said sealing ring and rim notch portions having a radius of curvature greater than that of said nozzle and disposed in opposite alignment with said nozzle radially of said tank and roof.

2,772,806
PRESSURE COOKER
Theophil Pfeffer, Esslingen (Neckar), Germany, assignor to Heinrich Ritter Aluminiumwarenfabrik, Esslingen (Neckar), Germany
Application January 21, 1954, Serial No. 405,340
Claims priority, application Germany January 21, 1953
7 Claims. (Cl. 220—44)

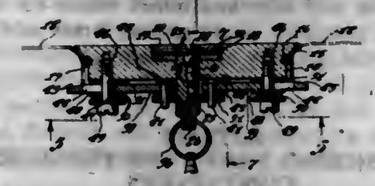
1. A cooking vessel comprising in combination a pot and a cover therefor, said pot and said cover each having surfaces adapted to contact each other, a projection on the outer wall of said pot, a portion on said cover extending outwardly beyond and downwardly below said projection, locking means adapted to act upon the lower surface of said projection and including a shaft rotatably mounted on said cover portion, a guide slot and pin for said shaft and said cover portion whereby said shaft moves axially upon rotation of the shaft, and a spring element and means mounted on the inner end of said shaft, so that when rotating said shaft, said spring element is first moved in a substantially horizontal direction toward the outer wall of said pot and below said projection, and then in an upward direction against the lower surface of said projection so as to lock said cover onto said pot.

2,772,807
SEALING CONSTRUCTION
Harry T. Booth, Dayton, Ohio, assignor to United Aircraft Products, Inc., Dayton, Ohio, a corporation of Ohio
Application July 23, 1953, Serial No. 369,896
2 Claims. (Cl. 220—46)



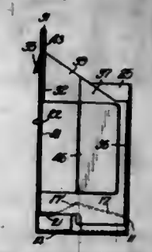
1. A sealing construction, including a pair of non-resilient elements in opposing relation to one another, a resilient deformable ring seal between said elements and spaced inwardly from the edges thereof, non-deformable shim means positioned between said elements in a relatively narrow annular path outwardly of said ring seal, said means permitting a relative approaching motion of said elements sufficient to place said ring seal under compression, and tie means interconnecting said elements at a point radially outwardly of said shim means and tightened to pre-stress said elements about said shim means as a fulcrum.

2,772,808
HAND-OPENABLE TOP FOR CANS
Louis Fried, Philadelphia, Pa.
Application October 31, 1952, Serial No. 318,130
10 Claims. (Cl. 220—48)

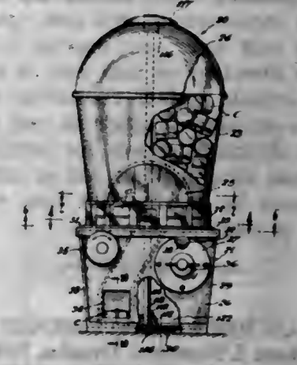


1. A hand-openable can top comprising a substantially flat plate of a shape similar to that of a can to which it is to be applied, a pair of slits in said plate with both ends of one slit terminating adjacent the respective ends of the other slit providing narrow joinders between the slits lying in a diametrical line of the plate, the major portion of each slit being spaced from the corresponding portion of the other slit so as to define a can top portion substantially separate from an encircling portion and extending across said diametrical line and the major part of the top portion between the slits, and means carried by said can top portion for effecting displacement of said can top portion and for effecting rotation of the same relative

to the encircling portion on said diametrical line so as to provide an opening in said can top for access to the contents of the can.



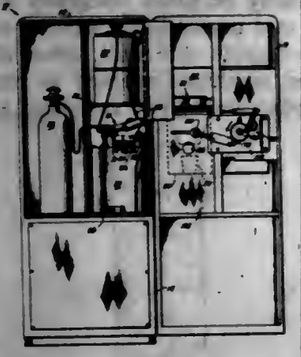
2,772,809
TANK FILLER CAP
Orrin E. Rose, Seaford, N. Y.
Application February 5, 1954, Serial No. 408,383
5 Claims. (Cl. 220—55)



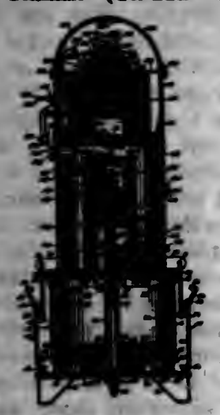
1. A filler cap for tanks or the like having a filler opening comprising an adaptor on the tank surrounding the filler opening therein, said adaptor being of substantially L-shaped cross section and presenting an inwardly extending substantially cylindrical opening, a plug adapted to fit within and close said cylindrical opening, a central axle rotatably mounted within said plug along the longitudinal axis of said cylindrical opening, the upper surface of said plug having a recessed portion surrounding the upper end of said axle, a handle adapted to fit within said recessed portion and having an opening at its inner end receiving the upper end of said axle, said handle and axle being pivotally connected, said axle extending downwardly through said plug, a plate secured to said axle below said plug, a plurality of pawls pivotally connected at their inner ends to the periphery of said plate, the outer ends of said pawls being adapted to extend beyond the lower edge of said adaptor surrounding said cylindrical opening when said handle is within said grooved portion whereby to prevent removal of said filler cap except by first raising and rotating said handle, said plate having a plurality of radially spaced openings, the inner end of each of said pawls having an opening aligned with one of said plate openings, pins within said aligned openings, each of said pins having an enlarged head disposed intermediate the upper surface of said pawls and the undersurface of said plug and spring washer means on each of said pins intermediate said plate and said pawls.

2,772,810
ARTICLE CARRIER
Edwin L. Arneson, Morris, Ill., assignor, by mesne assignments, to Federal Paper Board Company, Inc., Bogota, N. J., a corporation of New York
Application February 20, 1952, Serial No. 272,623
5 Claims. (Cl. 220—111)

1. A collapsible paperboard article carrier formed from a one-piece blank and comprising opposed side walls, a bottom extending therebetween and hinged to the lower margins thereof, said bottom being subdivided into a pair of sections by a medial crease about which the bottom is vertically collapsible to bring said walls into coplanar, face-to-face relation, end flaps integrally hinged to opposite ends of said bottom and having medial creases corresponding with the crease in the bottom, and a cross partititon unit hinged to one of said side walls along a top horizontal margin thereof, said cross partition unit including a plurality of panel integrally hinged to one another, one of said panels being secured in face-to-face relation to the opposite side wall, other of said panels constituting cross partitions adapted to extend between said side walls when the carrier is erected and being collapsible upon themselves about medial vertical creases, and terminal panels integrally hinged to said collapsible panels and secured in face-to-face relation to said side wall to which said cross partition unit is hinged, said bottom end flaps having notches in their inner edges and being swung upwardly about their hinged connection to said bottom when said carrier is in erected condition to bring the inner edges thereof into engagement with said cross partitions with the bottom edges of the latter engaged in said notches to brace the cross partitions laterally.

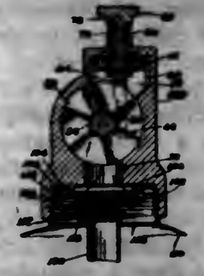


2,772,811
SELECTIVE BULK MERCHANDISE VENDING MACHINE
Harold M. Schaef, Chicago, Ill., assignor to Victor Vending Corp., Chicago, Ill., a corporation of Illinois
Application January 19, 1955, Serial No. 482,749
11 Claims. (Cl. 221—155)



1. In a coin-controlled vending machine including a pedestal base, a dispensing chute and dispensing actuating means; a bulk merchandise storage member, a selective merchandise member positioned on said pedestal base and below said storage member, said selective merchandise member having a plurality of outwardly exposed individual compartments each adapted to receive at least one item of merchandise from said storage member, a transparent housing enclosing said selective merchandise member with at least the compartment disposed above the dispensing chute positioned in the line of sight through a wall of said transparent housing, said selective merchandise member mounted for movement in a fixed path to position any selected compartment over said dispensing chute, selecting means for freely moving the selective mechandise member so as to dispose said selected compartment over said dispensing chute, and means for dispensing the merchandise from the selected compartment into said dispensing chute.

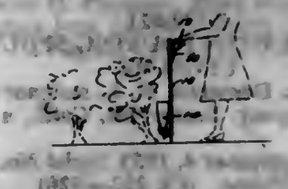
2,772,812
**DISPENSING VALVE AND OPERATING MEANS FOR BEVERAGE VENDING MACHINES**
Jack J. Booth, Dallas, Tex.
Application March 26, 1952, Serial No. 278,721
6 Claims. (Cl. 222—70)



1. A mixed drink dispensing machine comprising a source of carbonated water under pressure; a source of syrup under pressure; a mixing and dispensing valve having a body provided with a mixing chamber; means connecting said mixing chamber to the source of syrup; means connecting said mixing chamber to said source of carbonated water, said body having an outlet opening communicating with said mixing chamber and closed by a valve; an actuating lever for opening said valve mounted on said body; a mechanical timer operatively associated with said actuating lever for contacting said actuating lever and moving it to open the valve for a predetermined period of time whereby a predetermined quantity of carbonated water and syrup is dispensed each time the timer is actuated, said mechanical timer including a reciprocable rod mounted adjacent said actuating lever, said rod having a plurality of longitudinally spaced teeth, a gear rotatably mounted adjacent said rod and meshing with said gear teeth, a cam secured to said gear for rotation therewith, said cam having an arcuate outer surface, said actuating lever having an end projecting into the path of movement of said cam, said arcuate surface contacting said lever and moving it from its rest position in one direction as said gear is rotated in one direction, said arcuate surface contacting said lever and moving it in the opposite direction as said gear is rotated in the opposite direction, means for predetermining the rate of movement of said timer rod in said opposite direction; and means for moving said timer rod a predetermined distance in said one direction.

2,772,813
**GREASE CAN RECEIVING GREASE EJECTOR**
Phillmas L'Heureux, Omaha, Nebr.
Application November 7, 1952, Serial No. 319,358
4 Claims. (Cl. 222—82)

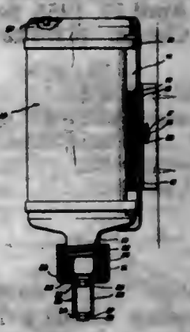
1. A grease ejector having a lower portion and an upper portion, the lower portion having an upwardly extending cylindrical side wall adapted to receive an open grease can in inverted position thereon and having a bottom closure member closing the bottom end of said cylindrical side wall, a pipe upwardly extending from said bottom closure member and mounted thereon, said pipe having at least one aperture extending transversely into the upper end thereof, the upper end of said pipe being disposed closely adjacent the bottom of said inverted grease can at times when said can is received completely on said cylindrical wall, said upper portion having an under surface adapted to rest upon the up-turned bottom of said grease can and having a hollow cylindrical member extending downwardly therefrom beyond said under surface, said hollow cylindrical member being snugly and slidably receivable in and against the inner wall of said upwardly extending pipe, the opening in the hollow cylindrical member being disposed in registry with said aperture in the upper end of said pipe for the flow of grease through said opening and said aperture at times when said under surface of said upper portion is disposed against the up-turned bottom of said grease can; and grease pump means having a pumping chamber having inlet means disposed in communication with said cylindrical member and having outlet means from said chamber, check valves in said inlet and outlet means for cooperating with said pump to pump grease from said cylindrical member through said outlet means.



2,772,814
**MEASURING VALVE FOR PRESSURE CONTAINERS**
David Meyers, Elkins Park, Pa.
Application April 28, 1953, Serial No. 351,561
12 Claims. (Cl. 222—82)

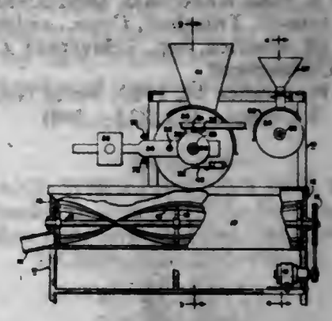
1. A dispensing head for use with pressure cans and adapted to deliver a relatively constant predetermined volume of the pressurized expansible fluid contents of the can with each operation thereof, said dispensing head comprising a housing having a metering chamber formed therein and having an outlet passageway and nozzle communicating with said chamber, an outlet valve mounted in said housing and constructed and arranged to open and close said outlet passageway, means including an inlet passageway formed in said housing and communicating with said metering chamber for delivering the pressurized fluid can contents to said chamber, manually operable actuating means mounted in said housing and including a reciprocable operating member connected with said outlet valve, said operating member being normally spring-tensioned to outermost position and being manually movable inward against spring-tension to actuate the outlet valve, and a control member movably mounted within said housing and operatively connected to said operating member for movement therewith, said control member being constructed and arranged to control the flow of fluid from the inlet passageway through said metering chamber, said actuating means being constructed and arranged to initiate delivery of the pressurized fluid can contents to the metering chamber following inward movement of the operating member and, during subsequent outward movement of the operating member, to terminate such delivery after a predetermined volume of the pressurized fluid can contents has been delivered to the chamber and then to permit the pressurized fluid in the chamber to expand and escape through the outlet valve, outlet passageway and nozzle.

2,772,815
**HAND DISPENSER FOR DRY FLUENT MATERIAL**
Paul Clark Bye, Pasadena, Calif.
Application October 25, 1954, Serial No. 464,216
4 Claims. (Cl. 222—185)



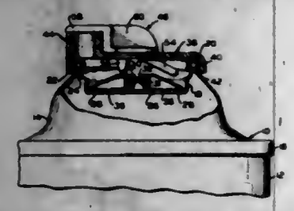
1. A hand dispenser for dry fluent material comprising a flat elongate member disposed upright on end for ground contact when in use, a receptacle carried on one side of said member in spaced relation with respect to the lower end thereof and having a downwardly directed discharge opening, a rotary measuring member supported in the receptacle above the opening, an elongate element carried vertically on the opposite side of said member for reciprocal movement, said elongate member having a vertical slot opposite the discharge end of said receptacle, and a finger carried at the lower end of said element and projecting through said slot for imparting a step turning movement to said rotary measuring member.

2,772,816
**SPRAYING DEVICES FOR POWDER**
George Denver, St. Mary's Terrace, London, England
Application March 8, 1954, Serial No. 414,829
Claims priority, application Great Britain March 12, 1953
13 Claims. (Cl. 222—189)



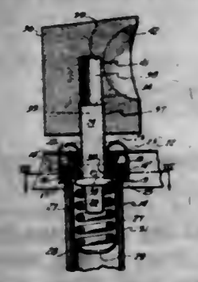
1. A powder spraying device comprising an inner cylinder forming a powder container, an outer cylinder slidably mounted on said inner cylinder, an outlet in the bottom of said outer cylinder and a one-way valve in conjunction with said outlet, whereby the cylinders together form a reciprocatory air pump, an air-tube passing through the inner cylinder, positioned close to the wall of the inner cylinder, to terminate in a position near the top of the powder container, and a one-way valve in association with the top of the air-tube, to define between the said valve and the top of the air tube a powder reservoir, the arrangement being such that, for downward or horizontal spraying, the air tube delivers a stream of air, through the powder in the area between the top of the air tube and the top of the inner cylinder, to carry powder to a spraying orifice, whilst, for upward spraying, the powder in the reservoir is carried to the spraying orifice.

2,772,817
**DISPENSING PUMPS**
Robert J. Jasch, Fort Wayne, Ind.
Application March 1, 1952, Serial No. 274,390
5 Claims. (Cl. 222—207)



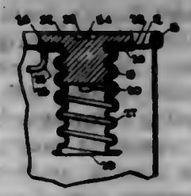
1. A pump for a fluid dispensing container having a wall defining a drain opening, said pump comprising a resilient walled barrel which is in communication with said container drain opening for receiving fluid discharged therethrough, a discharge opening in the lower end of said barrel, a valve for controlling the flow of fluid through said discharge opening, said valve being normally closed and opened in response to compressive stress exerted on said barrel to cause the same to deform and force liquid through said discharge opening, a check valve in the upper end of said barrel for controlling the flow of fluid into said barrel from said container, said check valve being normally closed and forced open in response to pressure produced by the vacuum created in said barrel upon the release of the compressive stress deforming said barrel.

2,772,818
**AUTOMATIC PROPORTIONING DEVICE**
Arthur B. McLauchlan, Salem, Oreg.
Application June 1, 1954, Serial No. 433,692
8 Claims. (Cl. 222—368)



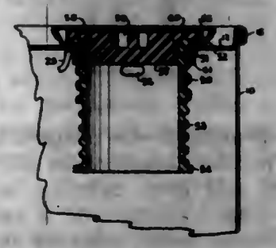
1. In a device of the character described including a frame, a rotatable drum having measuring pockets, and a rotatable shaft for said drum, a movable support in said frame for said shaft enabling said shaft and drum to be moved down and up, from normal raised position to lowered position, in response to the deposit of predetermined amounts of material in said pockets, a disc secured on said shaft, members on said disc corresponding in arrangement to said drum pockets respectively, a stop adapted to be contacted by said members when said drum is in normal raised position but not capable of being contacted by said members when said drum is in lowered position, and means on said disc, together with coacting means mounted on said frame and engaged by said first mentioned means, for lifting said disc and therewith said drum to normal raised position as the rotation of said disc brings one of said members into registration with said stop.

2,772,819
LEVER TYPE DISPENSER SYSTEM FOR PRESSURIZED CONTAINERS
Arthur E. Pearch, Mill Valley, and Paul E. Harrison, Gustine, Calif., assignors to Aveest Company, San Francisco, Calif., a corporation of Delaware
Application April 27, 1955, Serial No. 504,288
6 Claims. (Cl. 222—394)



1. In combination with a container for pressurized material, said container having a fixed top closure member provided with an upwardly directed discharge opening, and a yieldingly depressable and accessible valve closure element normally disposed in closing relation to said opening: a resilient cap attached to the upper end of said container, said cap having a discharge spout, a lever member carried by said cap and journalled for rotation about a vertical axis in said cap, a valve operating pin depending from said lever member, an arm formed on said lever member and disposed above said cap, said lever member and said opening being out of axial alignment whereby said lever member may be selectively rotated to bring said pin into and out of alignment with said opening, a pivot toe formed on said lever member and disposed within said cap, and pivot toe engaging means formed in said closure member adapted to receive said pivot toe and hold the toe against vertical movement when said lever member is rotated to bring said pin into alignment with said opening, whereby said arm may be depressed to yieldingly depress said cap and cause said pin to depress said valve closure element out of closing relation with respect to said opening.

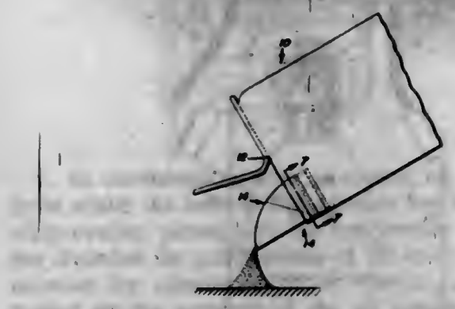
2,772,820
VALVE FOR AEROSOL DISPENSER
William R. O'Donnell, Trumbull, Conn., assignor to Valve Corporation of America, Inc., Bridgeport, Conn., a corporation of Connecticut
Application November 20, 1953, Serial No. 393,420
3 Claims. (Cl. 222—394)



1. A spray discharge valve for dispensing a fluid from a container, comprising a cover member for said container, said cover member having an aperture, a sheet metal tubular valve housing disposed in said aperture, one end of said housing having the wall thereof crimped to form annular surfaces for contact with opposite surfaces of said cover member to support said housing within said container, a disk of flexible material positioned in said housing and having a central aperture, a tubular member slidably fitting said disk aperture, said tubular member being closed at one end to provide a chamber, an annular flange formed from the wall of said tubular member and disposed intermediate the ends of said tubular member, a tension member for normally holding said flange in contact with one surface of said disk, said tubular member having a lateral passage in the wall thereof positioned to be closed by the wall of said disk aperture when said annular flange is in contact with said disk, the other end of said housing having an aperture for the passage of fluid to said chamber when said annular flange is moved from contact with said disk, a packing ring surrounding the perimeter of the aperture in said cover, said crimped wall of said housing retaining said packing ring in sealing relation to said cover aperture.

2,772,821
CONTAINER WITH POURING SPOUT AND CLOSURE
Clifton H. Phillips, Demarest, N. J., assignor to Shell Development Company, Emeryville, Calif., a corporation of Delaware
Application September 4, 1953, Serial No. 378,615
8 Claims. (Cl. 222—520)

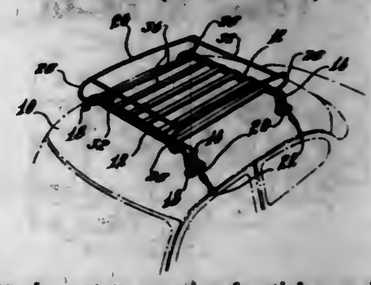
1. A container for liquid comprising a top having a discharge opening therein; a nozzle fixed to said top about said opening and forming a part thereof, said nozzle having internal screw threads; a pouring spout having a tubular part with external and internal screw threads situated within and in threaded engagement with said nozzle and having a peripheral flexible seal flange extending laterally outwards from the tubular part in sealed relation thereto and situated above said top for sealing engagement therewith; and an inverted type closure having a shank with external screw threads situated within and in threaded engagement with the said tubular part of the spout and having a peripheral rim extending laterally beyond the shank and over said seal flange for sealing engagement therewith and for urging said seal flange down against the top.



2,772,822
CONTAINER WITH SCREW OUT POURING SPOUT AND CLOSURE
Clifton H. Phillips, Demarest, N. J., assignor to Shell Development Company, New York, N. Y., a corporation of Delaware
Application December 17, 1954, Serial No. 475,863
6 Claims. (Cl. 222—520)

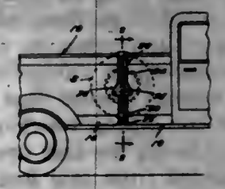
1. A container for fluid comprising a top having a discharge opening therein; a nozzle fixed to said top about said opening and forming a part thereof, said nozzle having internal screw threads; a pouring spout having a tubular part with external and internal screw threads situated within and in threaded engagement with said nozzle for movement relative thereto and having a peripheral, flexible seal flange extending laterally outwards from the tubular part in sealed relation thereto and situated above said top for sealing engagement therewith when the spout is retracted within the nozzle; an inverted type closure having a shank with external screw threads situated within and in threaded engagement with the said tubular part of the spout and having a peripheral rim extending laterally beyond the shank and over said seal flange for sealing engagement therewith and for urging said seal flange down against the top and a retaining element fixed to said top extending upward about the said seal flange and a tamper-proof seal cap over said closure engaged to said retaining element.

2,772,823
BAG SPOUT
Richard H. Plamann, Black Creek, Wis.
Application June 28, 1954, Serial No. 439,757
4 Claims. (Cl. 222—527)



4. In combination with a flexible bag having an openable top, a foldable pouring spout attached to the interior surface of the bag, said spout comprising a generally rectangular portion attached to the inner surface of said bag and having the top edge thereof generally parallel to the top of the bag, a spout forming portion foldably attached to the top edge of said rectangular section and disposed below said top edge in its folded position, said spout forming portion being unfoldable to a pouring position extending above the top of said bag when the bag is opened.

2,772,824
AUTOMOBILE TOP CARRIER FOR ELONGATE ARTICLES
Kenneth W. Binding, Medford, Mass., assignor to Leo M. Beckwith, Brookline, Mass.
Application September 23, 1953, Serial No. 381,783
4 Claims. (Cl. 224—42.1)

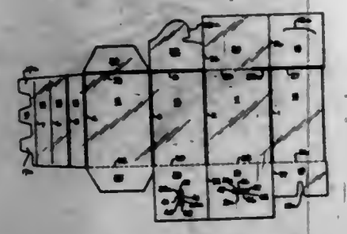


1. For attachment to a pair of unitary rigid article carrier bars for automobile tops which bars when mounted on an automobile top are in spaced parallel relation and extend transversely of the top, the bars having bridge portions intermediate their ends vertically spaced above the top and provided with a plurality of apertures spaced lengthwise thereof, a carrier attachment for each carrier bar for carrying elongate articles thereacross, each carrier attachment comprising a bracket designed to be positioned at substantially the midpoint and overlying one aperture of said bridge portion, a pair of rigid keeper bars extending from the bracket in opposite directions over the bridge portion and pivotally mounted at their adjacent ends to the bracket for movement from a clamping position parallel to the bridge portion to an angular position elevated therefrom, means at the opposite ends of the keeper bars extending through other apertures in the bridge portion near its ends when the keeper bars are in clamping position and engageable with the edges of the apertures to lock the bars in clamping position, and means for detachably fastening the bracket to the bridge portion including a fastening element extending through the said one aperture of the bridge portion.

2,772,825
AUTOMOBILE TOP CARRIER FOR LUGGAGE
Kenneth W. Binding, Medford, Mass., assignor to Leo M. Beckwith, Brookline, Mass.
Application September 23, 1953, Serial No. 381,784
2 Claims. (Cl. 224—42.1)

1. For attachment to a pair of article carrier bars for automobile tops which bars when mounted on an automobile top are in spaced parallel relation and extend transversely of the top, the bars having bridge portions intermediate their ends vertically spaced above the top and provided with a plurality of apertures spaced lengthwise thereof, a luggage carrier attachment comprising a pair of transversely spaced longitudinal guard rails extending substantially parallel to the sides of the automobile and the ends of which extend over and adjacent the ends of the bridge portions of the bars and have apertures in registry with certain of the apertures in said bridge portions, longitudinally spaced transverse rails attached at their ends to the guard rails near the opposite ends of said guard rails, a plurality of longitudinally extending transversely spaced slats spanning the space between the bars and having apertures at their ends in registry with certain other of the apertures in said bridge portions of the bars, and fastening elements extending through the registered apertures of the guard rails and bridge portions of the bars and through the registered apertures of the slats and bridge portions of the bars, respectively, for detachably fastening the guard rails and slats to the bars.

2,772,826
TIRE AND WHEEL MOUNT FOR TRUCKS
Charles H. Krengel, Twin Falls, Idaho
Application February 12, 1954, Serial No. 409,914
1 Claim. (Cl. 224—42.24)

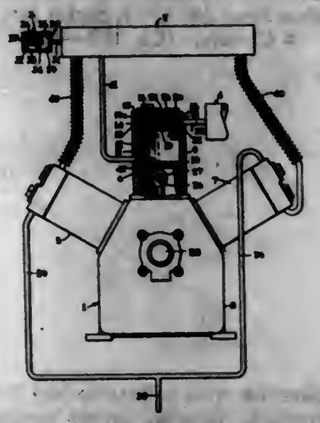


In a tire and wheel mount for a vehicle of the character described, the combination with a body structure supported on a chassis, said body structure having a sidewall terminating at the upper edge in an outwardly and upwardly extending flange, of a standard disposed vertically and in outwardly spaced relation to said sidewall, a longitudinally extending slot in said standard, a bracket fixed to said flange, screw threaded means on said bracket extending through said slot adjacent the upper end to secure the upper end of said standard to said sidewall, means adjacent the lower end of said standard for securing the same to said chassis, a wheel bracket, fastening means on said last named bracket

extending through said slot for securing said last named bracket on said standard in vertically adjusted position, means on said last named bracket to removably secure a wheel thereto, a tire rest and fastening means on said tire rest extending through said slot for securing said tire rest in vertically adjusted position on said standard.

---

2,772,827
FOOD PACKAGE
Bennie A. Rafoth and Howard N. Hovland, Appleton, Wis., assignors to Marathon Corporation, Menasha, Wis., a corporation of Wisconsin
Application January 17, 1955, Serial No. 482,144
2 Claims. (Cl. 229—51)



1. A carton for packaging a block of a comestible therein and for receiving a handle, the carton being formed from a single blank suitably cut and scored to provide a front wall, a first side wall, a rear wall and a second side wall, said walls being hingedly connected by score lines, a glue panel hingedly connected to said second side wall, said glue panel being adapted to be folded over and adhered to the said front wall, each of said front, rear and side walls being provided with closure flaps at their upper and lower portions, the upper closure flap of the said front wall being provided with a slit portion for engagingly receiving a tongue portion therein, the upper closure flap of the rear wall being provided with a tongue portion for engagement in the slit portion of said closure flap of the front wall, the upper closure flap of said first side wall being hingedly connected to said wall along a perforated score line extending substantially the entire length of said side wall but stopping short of the hinge line connecting said side wall to said front wall, the lower closure flap of said first side wall being provided with a handle-receiving internal slit extending parallel to the hinge line of said closure flap, the lower closure flap of said rear wall being provided with an internal slit for receiving a handle therethrough and extending along a line perpendicular to the hinge line connecting said rear wall and said lower flap, said lower closure flap of said first side wall and said lower closure flap of said rear wall being hingedly connected to said walls along perforated hinge lines, whereby upon pulling the said glue panel and releasing same from the said front wall the walls, upper closure flaps and front and second side wall bottom closure flaps are strippable from the block of the comestible which may be retained in said carton while leaving the said two lower flaps having said slits disconnected from said first side wall and rear wall in frictional engagement with the handle inserted therethrough and in supporting relation to such block of comestible.

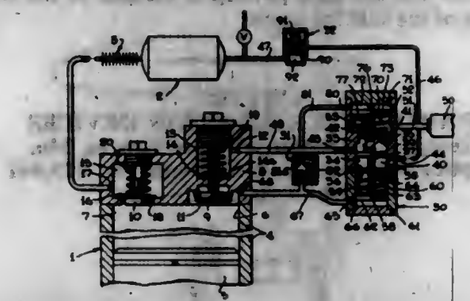
---

2,772,828
AIR COMPRESSOR
Rankin J. Bush, Greensburg, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application October 25, 1952, Serial No. 316,876
3 Claims. (Cl. 230—46)

1. In combination with a reservoir for storing compressed air, first, second, and third air compressing means, each of said compressing means including a cylinder and piston, all said compressing means being of substantially the same capacity and all said pistons being connected to the same prime mover for operation thereby, means connected to said first and second compressing means for cooling and storing the outputs thereof, said third compressing means having an inlet and an outlet, said outlet being connected to the reservoir, and means for admitting cooled air from said cooling and storing means to said third compressing means for addition to the air in said last named compressing means admitted through said inlet to

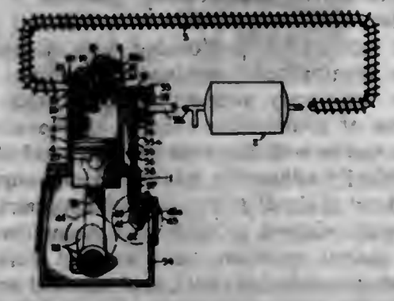
increase the output of compressed air from the third compressing means and limit the temperature rise therein resulting from heat of compression to a low value, said first and second compressing means supplying air to said cooling and storing means at a greater rate than it is delivered from said cooling and storing means to said third compressing means to thereby insure that a substantial amount of cooled air at a substantial pressure is always readily available for introduction into said third compressing means.

---



2,772,829
INFLATION ASPIRATOR
James V. Crawford and Richard A. Fischer, Los Angeles, and Dan B. Le May, Palos Verdes Estates, Calif., assignors to The Garrett Corporation, Los Angeles, Calif., a corporation of California
Application May 2, 1955, Serial No. 507,355
(Filed under Rule 47(a) and 35 U. S. C. 116)
8 Claims. (Cl. 230—95)

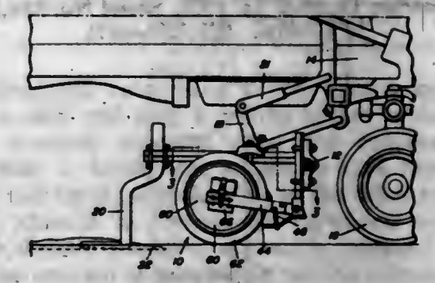
1. In apparatus for inflating a container, an aspirator comprising a tubular body having inlet and outlet ends, said body being formed for attachment to the container to be inflated; check valve means at the inlet end of said body, said check valve means being movable between an open position providing for the entrance of atmospheric air into said container and a closed position preventing the escape of air from said container; and nozzle means projecting into said body and terminating inwardly beyond said check valve means in a restricted orifice for directing a jet of fluid axially of said body, said nozzle means being formed for communicating with a source of fluid under pressure.



2,772,830
AIR COMPRESSING APPARATUS
George L. Cotter, Pittsburgh, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application June 22, 1953, Serial No. 363,202
11 Claims. (Cl. 230—208)

1. In combination with a source of compressed air from which the heat of compression has been removed, a reciprocating piston type air compressor having a cylinder chamber for compression of air and an inlet communication for admittance of air thereto, and means controlled by the pressure of the air obtaining in said cylinder chamber to connect said inlet communication selectively to the atmosphere and to said source during each successive inlet stroke and compression stroke, respectively, of said compressor.

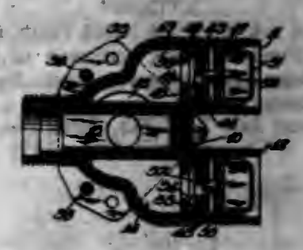
---



2,772,831
AIR COMPRESSOR
George L. Cotter, Pittsburgh, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application February 16, 1953, Serial No. 337,141
4 Claims. (Cl. 230—211)

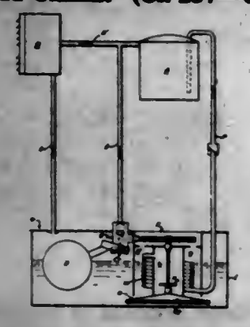
1. In combination with a source of cooled gas under pressure, a compressor having a gas compressing chamber and piston means defining an end wall of said chamber movable alternately and successively through a suction stroke in which said chamber is expanded from a minimum size and through a compression stroke in which said chamber is contracted from a maximum size to its minimum size, a rotatable crankshaft operatively connected to said piston means, pressure differential operated inlet valve means connected to said chamber and responsive to reduction in pressure of gas in said chamber resultant from movement of said piston means through its suction stroke to open said chamber for admission thereto of an initial charge of gas to be compressed, cooling-gas-admission-control valve means connected to said chamber and to said source for controlling admission of gas under pressure from said source into said chamber, bias means connected to and urging said cooling-gas-admission-control valve means towards a closed position, and cam means operatively connected to said cooling-gas-admission-control valve means and connected to said crankshaft for rotation in synchronism therewith to open said cooling-gas-admission-control valve means for a period during the compression stroke of said piston means and permitting said cooling-gas-admission-control valve means to be closed by said bias means at all other times.

---



2,772,832
ROW CROP METER
Jesse Lassiter, Four Oaks, N. C.
Application July 1, 1955, Serial No. 519,425
3 Claims. (Cl. 235—95)

1. A row crop meter adapted to be attached to a farm implement tool bar comprising a bracket, a yoke extending from said bracket, a ground engaging wheel journaled on said yoke, said yoke being pivotally attached to said bracket, spring means urging said wheel into engagement with the ground surface, an indicating counter mounted on said yoke, means interconnecting the counter and wheel for registering the rotation of the wheel, said wheel adapted to be mounted closely behind and in the path of movement of a tractor wheel whereby the wheel will engage the packed track of the tractor wheel for providing an accurate reading, a scraper mounted on said yoke in closely spaced relation to the wheel for removing excessive soil therefrom, a braking bar disposed adjacent the periphery of said wheel below the horizontal center line thereof, said spring means urging said yoke and wheel downwardly into engagement with the braking bar when the bracket and wheel are raised.

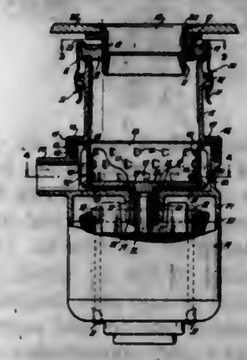


---

2,772,833
FLUID MIXING DEVICE
Thomas B. Chace, Winnetka, Ill., assignor to The Dole Valve Company, Chicago, Ill., a corporation of Illinois
Application September 28, 1951, Serial No. 248,829
11 Claims. (Cl. 236—12)

1. A fluid control means providing a substantially constant rate of flow regardless of pressure variations of the fluid at the source and adjusting the flow rate in accordance with the temperature of the fluid comprising a conduit, a deformable flow control annulus seated therein and flexing in the direction of flow through said conduit, a member on the upstream side of said annulus at least partially projecting into said annulus, said member being shaped to vary the effective size of the opening in said annulus upon axial movement with respect thereto, and a temperature responsive element carrying said member and moving said member axially with respect to said annulus as the temperature of the fluid varies.

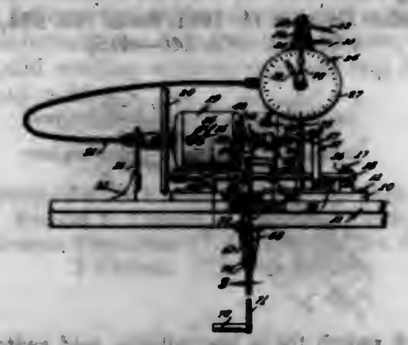
2,772,834
**STEAM TURBINE OPERATED CENTRIFUGAL PUMP MECHANISMS**
Paul F. Swenson, Cleveland Heights, and Myron T. Cooperrider, East Cleveland, Ohio, assignors, by mesne assignments, of thirty-seven percent to Otto Wanek, two percent to Kenneth J. Kitchen, ten percent to Paul F. Swenson, ten percent to Marcus O. Swenson, four percent to Myron T. Cooperrider, eleven percent to Wilma G. Stupka, eleven percent to Wilma G. Stupka, trustee, ten percent to J. A. Weeks, and five percent to Earl P. Schneider, trustee
Application October 22, 1952, Serial No. 316,212
11 Claims. (Cl. 237—67)



8. An apparatus for a closed circuit system employing a steam generator, a heat exchange apparatus supplied with steam thereby, and a condensate return line; said apparatus comprising a vented condensate reservoir tank adapted for connection to the return line, a steam turbine adapted for connection to receive steam from the generator and having an upright exhaust-steam-condensing chamber within the condensate reception space of the tank, said chamber having a continually open outlet into the tank in a position to be always sealed by condensate in the tank, a condensate pump permanently connected for operation by the turbine and having its inlet in the tank and its outlet uncommunicated with the interior of the tank and adapted for connection with the generator, a turbine steam supply valve, and operating means for the valve arranged and connected for operation of the valve cyclically from "on" to "off" valving positions as a function of high and low quantity respectively of condensate in the tank, whereby the reception space for turbine exhaust steam in the condensing chamber is automatically enlarged as the quantity of condensate in the tank is diminished by progression of the cycle toward completion.

2,772,835
**ELASTIC CLAMP FOR FIXATION OF RAILS**
Marcel Prot, Paris, France, assignor to Societe Industrielle de Liaisons Electriques, Paris, France, a corporation of France
Application July 24, 1953, Serial No. 369,998
4 Claims. (Cl. 238—349)

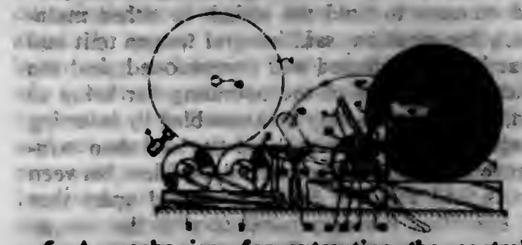
1. In combination, a sleeper, a flange type rail resting on said sleeper, a metallic elastic clamp for securing the rail to said sleeper, a lag screw to secure said clamp to said sleeper, said sleeper having a notch therein near said rail, said clamp comprising a piece of spring sheet steel forming a flat shoe portion resting solidly upon the sleeper and having a generally trapezoidal form and including a large base applied against the edge of the rail flange and a small base pressing against the edge of said notch, opposed wings extending upwardly from opposite sides of the flat shoe in spiral form and having the extremities free and directed towards the large base and slightly inclined towards the rail flange so that the extremities overhang in relation to the large base of the shoe and bear elastically on the rail flange to exercise a pressure on said flange resulting from the elastic deformation of the said wings when the flat shoe portion is secured to the sleeper by means of the said lag screw.



2,772,836
**FOOD-WASTE REDUCTION DEVICES**
George D. Gebhart, Webster Groves, Mo.
Application March 8, 1952, Serial No. 275,481
8 Claims. (Cl. 241—46)

1. In a shredder device for food refuse, a rotary shredder element mounted for operation about a vertical axis, a housing for and coacting with the shredder element, the housing being of a vertically elongate proportion, and adapted to be mounted below the drain opening of a sink or the like, a motor supported by the housing, a drive connection of slidably interfitting type, between the motor and the shredder element, a plurality of quick-acting clamps adapted to support the device from a sink or the like above the shredder element, a support rotatably threadedly connectible to a sink tail piece or the like, said support being provided with clamp engageable seats, the clamps being arranged to engage said clamp seats for temporary support of the device incident to completion of connections thereto, clamp screws threadedly engageable with the said support, said clamp screws being vertically adjustable relative to said support, means located about said tail piece above the support, said clamp screws being adapted to abut said means to secure said support against rotation, said support being provided with a lower annular channel, said channel being adapted to receive the upper periphery of said housing in sealing relation upon closing of said quick-acting clamps, and connections through which the motor is supported and detachably connectible to the housing independently of the connection of the housing to the tail piece or the like of the associated sink.

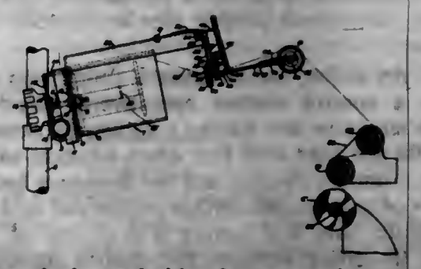
2,772,837
**COIL WINDING MACHINE**
James L. Carroll, Indianapolis, Ind.
Application May 10, 1954, Serial No. 428,659
4 Claims. (Cl. 242—9)



4. In a machine for winding coils, a base, clamps secured to said base, a rod extending between said clamps and secured thereto, a motor supported by said rod and connected to a source of electrical energy, a handwheel connected to said motor, a flexible shaft operated by said motor, a counter operated by said flexible shaft and including movable pointers, a solenoid arranged contiguous to said counter and including a core mounted for movement into and out of blocking engagement with a pointer of said counter, said solenoid being connected to said power source, a drive shaft extending from said motor, a sleeve mounted on said shaft, a bushing mounted on said sleeve and secured thereto, a collar slidably mounted on said sleeve and mounted for movement towards and away from said bushing, resilient means mounted on said sleeve and interposed between said bushing and collar, said collar being provided with an inner recess, a chuck

including pivotally mounted jaws having fingers engaging said recess, said jaws clamping therebetween a coil form lead, a tailstock supported by said rod and provided with a slit therein for receiving the other coil form lead, and means for operating said jaws.

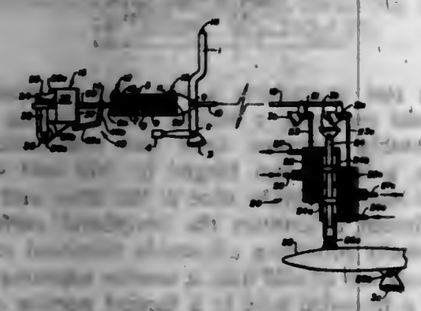
2,772,838
**MECHANISM FOR EXTRACTING THE REWIND SHAFT FROM A CORE OF A REWOUND ROLL AND INSERTING THIS SHAFT INTO THE CORE OF A ROLL TO BE REWOUND**
Bernhard Lenz, Duesseldorf, Germany, assignor of one-half to Jagenberg-Werke Akt.-Ges., Duesseldorf, Germany
Application November 3, 1953, Serial No. 389,977
8 Claims. (Cl. 242—55)



5. A mechanism for extracting the central reel bar from the tubular core of a wound reel and inserting the extracted bar into the core of a reel to be wound and which reel bar is of the type having a protruding portion terminating in a grippable end and extending beyond the core of a wound reel, said mechanism including means for displacing a wound reel from a winding position to a supported position, reel bar gripping means mounted for movement in opposite directions axially of a reel bar, means for swinging the gripping means in opposite directions about an axis parallel to the axis of a supported wound reel from a position in the path of movement of the protruding portion of the bar to an intermediate bar extracting position and then to a bar inserting position, said gripping means including bar engaging surfaces adapted to engage the grippable end of the reel bar responsive to movement of the gripping means to said intermediate position, reversible means operative when the gripping means is in the intermediate position to move the same and thus the bar engaged by the gripping means axially outward of the wound reel to extract the bar, swingably mounted means for supporting the opposite end of the reel bar after extraction thereof, the means for swinging the gripping means being operative to swing the last mentioned swingable means and the supported and gripped reel bar into bar inserting position whereupon reverse movement of said reversible means moves the gripping means in the reverse direction axially of the bar to insert the bar into a core of a reel to be wound.

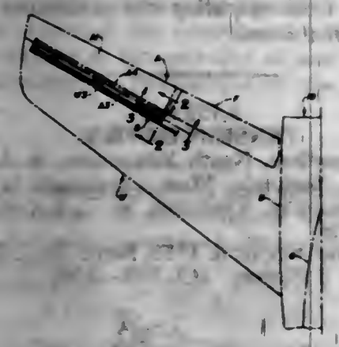
2,772,839
**FISHING REEL**
Cullen F. Morton, Booneville, Miss.
Original application August 10, 1954, Serial No. 448,862. Divided and this application August 29, 1955, Serial No. 530,931
1 Claim. (Cl. 242—84.5)

A fishing reel comprising a reel seat, a spindle attached to said reel seat, a reeling spider having a hub portion rotatably mounted upon and concentric with said spindle, a brake arm hinged to said reel seat at one end and having a brake shoe at the other end which may be adjusted to contact the peripheral surface of said hub thereby providing adjustable frictional retardation to the rotation of said hub, a tension adjusting screw received by a threaded hole in a flanged portion of said reel seat, said tension adjusting screw having a shoulder below the threaded portion which contacts one end of a coiled tensioning spring, said tension adjusting screw having an unthreaded portion of reduced diameter below said shoulder which portion passes concentrically through said tensioning spring and through a hole in said brake arm thereby confining said tensioning spring between said shoulder and said arm, a circumferential groove about the lower end of said unthreaded portion of said tension adjusting screw which groove carries a retaining ring which forms a shoulder about the lower end of said unthreaded portion below said hole in said arm thereby preventing the accidental removal of said tension adjusting screw and also affording a means whereby continued rotation of said tension adjusting screw in the proper direction will cause said retaining ring to contact said brake arm whereupon further rotation of the screw in the same direction will cause said brake shoe to be removed from contact with said hub, thereby releasing the adjustable frictional retardation of reel rotation entirely from operating and permitting freest possible rotation of the reel.



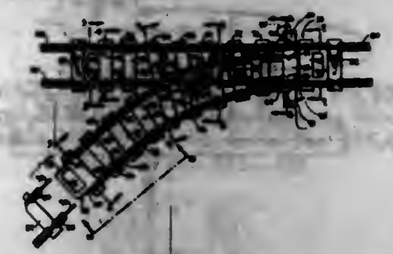
2,772,840
**TENSION-DEVICE**
William V. Goodhue, North Kingstown, R. I., and Curt J. Rohland, Seekonk, Mass., assignors to Universal Winding Company, Cranston, R. I., a corporation of Massachusetts
Application August 6, 1953, Serial No. 372,656
5 Claims. (Cl. 242—128)

1. In a tension-device, a holder for supporting a spool or other container for wound strand material, a pair of resilient pads spaced from said holder and arranged in contact to adapt the strand to draw therebetween, a pivoted arm, resilient means for controlling the pivoting of said arm, a flanged pulley mounted on said arm in position to adapt the strand to feed thereabout as it draws between the resilient pads, and a resilient annulus of cylindrical cross-sectional form surrounding said pulley



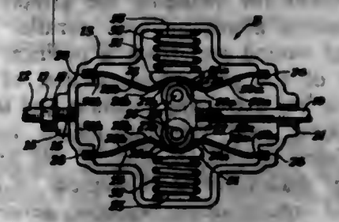
to adapt it to bear against the strand and force it laterally against the flange of said pulley to apply resistance to its draft.

2,772,841
AIRCRAFT TRIM CONTROL
Donald H. Benstead, Inglewood, Calif., assignor to North American Aviation, Inc.
Application April 28, 1955, Serial No. 504,487
5 Claims. (Cl. 244—83)



1. In combination with an airplane control, elastic means operatively connected to said control for exerting opposed restoring forces to said control to urge said control toward a neutral position, trim means including an eddy current damper operatively connected to said elastic means, means for selectively locking and releasing said trim means whereby displacement of said control from said neutral position and selective releasing of said trim means permits dampened movement of said trim means under the influence of the restoring force developed by said elastic means for establishing a new neutral position for said control.

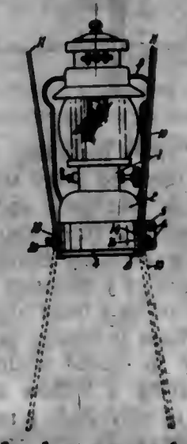
2,772,842
CONTROL SURFACE SEAL
Vesa L. Darby, Redondo Beach, Calif., assignor to North American Aviation, Inc.
Application May 25, 1953, Serial No. 357,270
5 Claims. (Cl. 244—90)



1. An aerodynamic balance comprising a wing structure, a control surface operatively mounted upon said wing structure and having a forwardly extending balance paddle provided with free edges adjacent said wing structure, a unitary flexible seal for the space between the free edges of said control surface paddle and said adjacent wing structure, said seal having a first area of greater width than the space between the control surface paddle and the wing structure, said first area having a first margin attached to the control surface and an opposite margin attached to the wing structure, said first area disposed substantially in the plane of said control surface paddle, said seal having a second area folded with respect to said first area and having its opposite margins attached to said control surface and to the wing structure, respectively, said second area being disposed in the direction of the thickness of said control surface.

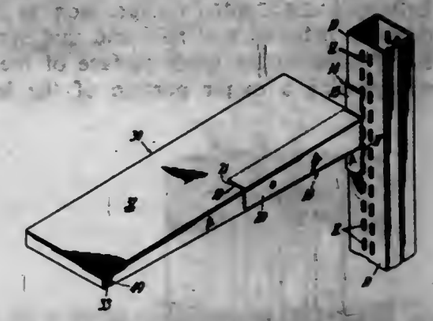
2,772,843
MOLDED PLASTIC TRACK SWITCH FOR A TOY RAILWAY
Willis E. Rexford, Girard, Pa., assignor to Louis Marx & Company, Inc., New York, N. Y., a corporation of New York
Application January 11, 1951, Serial No. 205,540
4 Claims. (Cl. 246—415)

1. A track switch for a toy railway, said switch comprising only two pieces each molded out of a suitable molding plastic which is rigid at room temperature, one piece having main line rails, branch line rails, a common end for the outer rails, a frog for the inner rails, and simulated ties, said parts being all molded integral, and the other piece being a pivoted tongue unit comprising a base above said ties, a main line rail, a branch line rail, and an operating bar all molded integrally with said base, said rails of said tongue unit being beveled at one end to mate with the frog and being tapered at the other end to form tongues cooperating with the outer rails, said movable operating bar being disposed beneath the outer rails at the common end, said bar having an integrally molded upwardly projecting finger piece to facilitate operation of the switch, the bottom of said common end and the top of said operating bar having mating detent projections and recesses to hold the switch in either main-line or branch line position, said integral tongue unit and operating bar being so shaped and dimensioned, and the simulated ties on each side of the operating bar being so spaced apart, that the parts may be assembled by inserting the tongue upwardly between the said ties and then turning the tongue down to its horizontal position between the outer rails, and said ties being so spaced apart that the integral operating bar may oscillate with the tongue as the bar is moved longitudinally to operate the switch.



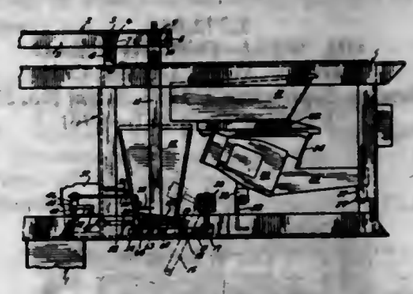
2,772,844
RAILWAY SWITCH CONNECTING ROD
Kenneth J. J. McGowan, Pittsburgh, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Application December 16, 1952, Serial No. 326,333
5 Claims. (Cl. 246—452)

1. Apparatus for interconnecting an element of a railway switch with an element of a switch stand, comprising a deformable spring cam for connection with one of said elements and having symmetrical working surfaces about a median point, a cam follower for connection with the other of said elements and cooperating with the working surfaces of said cam, and resilient means biasing the median point of said cam in engagement with said cam follower to maintain said cam follower in engagement with said cam at its median point when said switch stand element is operated to throw said switch, the working surfaces of said cam being such that when said switch element is moved by a trailing vehicle the bias of said resilient means is increased and said cam is deformed due to the relative movement between said cam follower and said working surfaces, a predetermined relative movement between said working surfaces and said cam follower permitting the stressed resilient means and the deformed cam to increase the relative movement between said working surfaces and said cam follower to reverse said switch.



2,772,845
SUPPORTS FOR LANTERNS AND THE LIKE
Ronald E. Conant, Kalamazoo, Mich.
Application December 17, 1951, Serial No. 261,940
2 Claims. (Cl. 248—150)

1. In a support for lanterns and the like, the combination of an annular split resilient body member for clampingly receiving the base of a lantern therein having angularly spaced inturned lantern supporting lugs on its lower edge and having outturned ears at the ends thereof, a clamping screw disposed through said ears, said supporting lugs being disposed on a level below that of said out-turned ears and clamping screw, angularly spaced pivots disposed on a level above that of said supporting lugs and projecting radially from said body member, legs swingably mounted on said pivots and each having an inwardly facing recess providing spaced lugs on opposite sides of each of said pivots, said body member being provided with slot-like keepers spaced from said pivots to receive one lug of each leg when the legs are in erected position extending vertically downwardly from said pivots, and the other lug of each leg when the legs are in collapsed position extending vertically upwardly from said pivots, and springs arranged on said pivots at the outer sides of the legs and acting to urge the legs yieldingly inward for releasably retaining the lugs in engagement with the keepers.

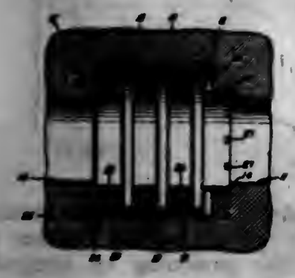


2,772,846
SHELF BRACKET
John G. L. Skar, Jamestown, N. Y., assignor to Art Metal Construction Company, Jamestown, N. Y.
Application May 25, 1951, Serial No. 228,288
5 Claims. (Cl. 248—243)

3. In adjustable shelving, in combination, an angular sectioned support member having front and side wall portions and apertures in vertically spaced relation through said front wall portion, a shelf bracket of generally T-shaped form comprising an upright first member of generally channel sectioned bent metal form having a front wall and a side wall and a series of vertically aligned hook devices extending vertically from said front wall and adapted to hook-fit into the apertures of said support member while the front and side wall of said first bracket member embrace the front and side wall portions respectively of said support member, said bracket comprising also a second member of channel section bent metal form disposed horizontally and having a top wall portion thereof abutting said first member front wall and having a side wall portion formed with a branch section extending

to lie alongside said side wall of said first bracket member; said bracket members being welded together at positions of contiguity thereby providing an integral generally T-shaped bracket unit.

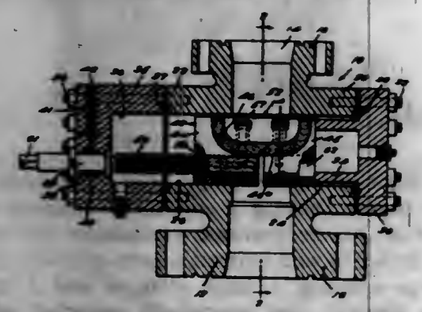
2,772,847
APPARATUS FOR FEEDING BULK MATERIAL AND CONTROL THEREFOR
Frank L. Hopkins, Minneapolis, Minn., assignor to Bemis Bro. Bag Co., St. Louis, Mo., a corporation of Missouri
Application January 14, 1955, Serial No. 481,948
7 Claims. (Cl. 249—45)



1. In a machine for weighing and dispensing bulk material; a hopper having a discharge opening in its bottom portion; power operated mechanism for causing material to be fed to said hopper; a gate normally closing said discharge opening; a latch element and a cooperating strike element, one operatively mounted on said hopper and the other operatively mounted on said gate; mechanism for tripping said latch element to cause opening of the gate; a locking element engaging said latch element to releasably lock said latch element in its tripped position when the gate is open; and control means for said power operated mechanism including a control element operated by said latch tripping mechanism to render the power operated mechanism inoperative responsive to latch tripping movements of said tripping mechanism, and to render the power operated mechanism operative responsive to release of the latch element by the locking means therefor upon closing of said gate.

2,772,848
FLUID SEAL ELEMENT
Theodore H. Holzer and Donald C. Asbury, Glendale, Calif., assignors, by mesne assignments, to The Parker Appliance Company, Cleveland, Ohio, a corporation of Ohio
Application November 28, 1952, Serial No. 322,862
1 Claim. (Cl. 251—172)

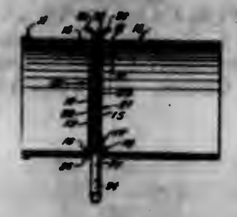
In a sealing device of the class described, the combination of: a first member having a fluid passage and a counterbore communicating therewith, said first member also having a shoulder, a second relatively movable member having a sealing surface and a port communicating with said surface, a sealing unit received in the counter-



bore, the sealing unit including metallic bellows having one end engaging the shoulder, a ring fixed to the other end of the bellows and provided with a relatively narrow sealing lip having a sealing face engaging the said sealing surface, the bellows having initial compression to maintain sealing pressure between said face and said surface, a rubber sleeve bonded to the outer surface of the bellows and encompassing a major portion of the length

thereof, the outer surface of the rubber sleeve being of greater diameter than said ring and forming a seal with said counterbore, passage means establishing communication between the fluid passage and the counterbore at a location at the opposite end of the bellows from the ring, whereby fluid pressure in the passage acts to expand the rubber sleeve radially and also acts to increase the axial sealing pressure on the ring.

---



2,772,849
**OIL WELL TUBING HEAD**
Melvin C. Davis, Denver, Colo.
Application September 3, 1953, Serial No. 378,370
1 Claim. (Cl. 251—194)

An oil well tubing head comprising a body having a tool and tubing passage therethrough, means carried by the body at each end of said passage for securing the body to and in line with well apparatus, aligned arms integral with said body and extending radially of said passage, said arms having aligned longitudinal passages forming a tubular chamber intersecting the body passage, a closure member at the outer end of each arm passage, a cylindrical valve body slidably positioned in said chamber for movement to a position across the body passage to close the latter, said valve body comprising two spaced cylindrical members having curved recesses formed across the sides thereof and opening through their adjacent ends, a single body of packing material lying in said recesses and bridging the space between the members, a transversely arcuate saddle member lying upon the body of packing material, said body of packing material having a continuous edge lying flush with the cylindrical surface of the valve body, said saddle member having end faces opposing correspondingly formed faces of the recesses, said packing material being pressed between said opposing faces, means loosely coupling the saddle and the cylindrical members whereby relative movement between the same is permitted, the periphery of the packing material being arranged to encircle the body passage when the valve is in closing position thereacross, and means for effecting axial movement of the valve body and for forcing the cylindrical members thereof toward one another when it is in said closing position to effect the compression of the packing element and lateral projection of the periphery thereof beyond the periphery of the valve body members.

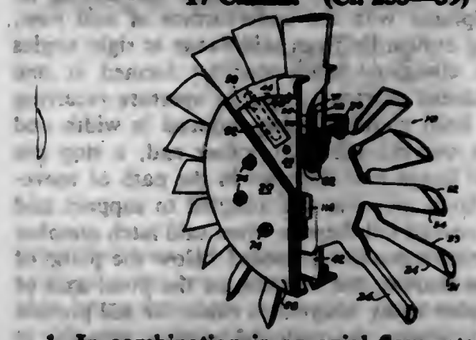
---

2,772,850
**FLOW CONTROL GATE**
Nelson C. Eaton, Lubbock, Tex.
Application May 9, 1955, Serial No. 507,072
10 Claims. (Cl. 251—306)

1. A flow control valve including a cylindrical body having diametrically opposed holes therein, a bifurcated shaft extending through said holes and said body, a rigid disc interposed between the furcations of said shaft and of a diameter less than the inner diameter of said body, a disc of resilient material of a diameter substantially equal to the inner diameter of said body affixed to one face of said rigid disc and whose perimeter is in sealing engagement with said body in closed position of said valve, said resilient disc having a hollow diametrical rib receiving one furcation of said shaft, a pair of diametrically opposed resilient segments on the opposite face of said rigid disc receiving the companion furcation of said shaft, means integral with said resilient disc and said segments for sealing the openings in said body about said shaft, means for actuating said shaft to open and close said valve and means for precluding longitudinal displacement of said shaft.

---

2,772,851
**ROTOR CONSTRUCTION**
Edward A. Stalker, Bay City, Mich., assignor to The Stalker Development Company, Bay City, Mich., a corporation of Michigan
Application June 14, 1950, Serial No. 167,981
11 Claims. (Cl. 253—39)



1. In combination in a compressor rotor, a hub structure, axially spaced disk shaped side plates fixed at their radially inner portions to said hub structure, each said plate having a slot extending radially inward from the periphery thereof, a hollow blade having chordwise extending flanges along the leading and trailing edges of the root portion thereof fitting into respective said slots in opposite plates, each said flange being bonded to the walls of its respective said slot, and peripherally extending segments radially outward of and in centrifugal load supporting relation with said flanges and bonded to each side plate across said slot to transmit peripheral stress thereacross.

2,772,852
**ROTOR CONSTRUCTION FOR FLUID MACHINES**
Edward A. Stalker, Bay City, Mich., assignor to The Stalker Development Company, Bay City, Mich., a corporation of Michigan
Application August 3, 1950, Serial No. 177,480
17 Claims. (Cl. 253—39)

1. In combination in an axial flow rotor, a hub structure including a radially extending side plate, a plurality of blades supported on said structure and spaced peripherally thereabout tending to produce vibrations in said side plate in operation, means joining each said blade to said plate, said plate having a cavity formed therein extending in a generally radial direction, a cover fixed to said plate and extending across said cavity defining an opposed wall portion thereof, and a vibration damper within said cavity attached to one wall of said cavity and frictionally engaging on another said wall thereof with a pressure varying with the rate of rotation of said rotor.

---

2,772,853
**COMPRESSOR DISCS**
Lee R. Woodworth, Los Angeles, Calif., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application April 7, 1952, Serial No. 280,866
3 Claims. (Cl. 253—39)

1. Coupling apparatus for securing first and second turbine discs in a predetermined adjacent relationship comprising a plurality of bosses mounted in circumferentially spaced relationship on each of said turbine discs, inner and outer radially overhanging uniting portions on each of said bosses, mating surfaces on each of said bosses of said first turbine disc, corresponding mating surfaces on said bosses of said second turbine disc adapted to be effectively placed in contact with said mating surfaces of said bosses of said first turbine disc, a plurality of uniting means for coupling said bosses in fixed relationship when said mating surfaces are in contact, one of said uniting means adapted to coact with said inner overhanging portions of said bosses, another of said uniting means adapted to coact with said outer overhanging portions of said bosses, each of said uniting means comprising a member having axially spaced lugs mounted in circumferentially spaced relationship thereon which are adapted to coact with the overhanging uniting portions of said circumferentially spaced bosses when the overhanging portions are in mating contact, said lugs being positioned with respect to each other on each of said uniting means so that when each of said uniting means is circumferentially moved relative to said bosses said lugs come into engagement with said overhanging uniting portions of said bosses, and means for rigidly fastening said uniting means to said bosses when said bosses and said uniting means are in assembled relationship.

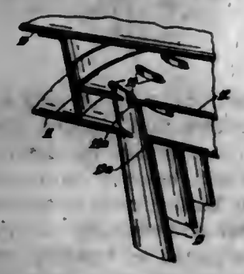
---

2,772,854
**VIBRATION DAMPING MEANS FOR BLADINGS OF TURBO-MACHINES**
René Anxionnaz, Paris, France, assignor of one-half to Societe Rateau (Societe Anonyme), Paris, France, a company of France
Application February 12, 1952, Serial No. 271,258
Claims priority, application France February 27, 1951
3 Claims. (Cl. 253—77)

1. In a turbo-machine rotor having a plurality of rotary blades circumferentialy spaced around the entire periphery of said rotor, means for damping vibrations of said blades comprising laterally protruding members on both sides of each blade, integral therewith at one end and free at the other end whereby said members undergo deflection when subjected to bending stress due to centrifugal force, the respective members of each pair of adjacent members belonging respectively to each two consecutive blades having substantially different mean lengths as measured between said ends and having opposed overlapping and parallel free surfaces adapted to come into frictional contact with each other, the said surfaces lying in planes substantially parallel to the axis of said rotor.

---

2,772,855
**FLUID TURNING BLADES**
Edward A. Stalker, Bay City, Mich., assignor to The Stalker Development Company, Bay City, Mich., a corporation of Michigan
Application August 3, 1950, Serial No. 177,479
5 Claims. (Cl. 253—77)

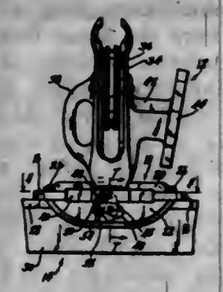


1. A hollow sheet metal fluid turning blade having leading and trailing edges and a predetermined airfoil contour as assembled comprising a base wall of sheet metal shaped to form the lower face of said blade and having spanwise recesses inwardly of and adjacent both leading and trailing edges thereof forming portions of reduced thickness substantially at the leading and trailing edges less than that of the adjacent portions of said base wall, said reduced thickness portion adjacent the leading edge being folded upon itself, forming a short radius bend the outer surface of which defines the nose of the blade, and a complementary blade wall of sheet metal supported in mating relation on said base wall, said complementary wall being shaped to form the upper face of said blade and having a contoured edge fitting within and fairing with said tapered marginal edge of said base wall, said walls being bonded together at the contiguous interfitting portions thereof.

---

2,772,856
**STRUCTURAL ELEMENTS FOR TURBO-MACHINES SUCH AS COMPRESSORS OR TURBINES OF GAS-TURBINE ENGINES**
Nelson Hector Kent, Allestree, and Cyril Armer, Chellaston, near Derby, England, assignors to Rolls-Royce Limited, Derby, England, a British company
Application July 3, 1953, Serial No. 366,021
Claims priority, application Great Britain July 11, 1952
10 Claims. (Cl. 253—78)

1. A structural element for a turbo-machine having a working fluid passage, comprising a first circumferential-



ly-extending sheet-metal skin to afford a section of the wall of said working fluid passage, a second circumferentially-extending sheet-metal skin secured coaxially with the first skin and spaced therefrom on the side thereof remote from said working fluid passage, each of said skins being formed with circumferentially-spaced slots, each slot in one skin being aligned with a corresponding slot in the other skin, and a plurality of aerofoil-section blade elements of a blade row of the turbo-machine supported by said spaced skins to extend cantileverwise across said working fluid passage, each blade element having an end portion engaged in an aligned pair of said slots, the end portion having cut-aways at its leading and trailing edges

to provide abutment shoulders facing in the direction of the lengthwise axis of the blade element towards the second skin, said shoulders being at a position lengthwise of the blade element to be in abutment with one of said skins, and each blade element having at least one slot in that part of the end portion which projects through the slot in the second skin to form a pair of oppositely-directed tangs, each tang having a surface which is inclined to the lengthwise axis of the blade element and faces towards said shoulders, and each tang extending laterally from the general contour of the blade element with its inclined surface bearing on the surface of said second skin remote from the working fluid passage, whereby said shoulders are drawn into abutment with said one of the skins.

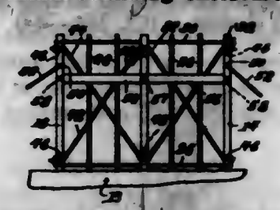
---

2,772,857
**PULLEY BLOCK AND BASE**
Everett M. Bush, South Nyack, N. Y.
Application March 24, 1954, Serial No. 418,436
2 Claims. (Cl. 254—195)

1. A pulley block and base comprising a pulley frame, a pulley rotatable within said frame, a flat non-circular supporting member secured to the bottom of said frame with the plane thereof substantially parallel to the axis of rotation of said pulley, an arm secured to and extending from one side of said pulley frame and a second flat, non-circular support member identical in size and shape and interchangeable with said first support member secured to the end of said arm, the plane of said second support being inclined slightly to the plane of rotation of said pulley, a substantially U-shaped base in plan having a flat undersurface adapted to rest on a truck bed or the like, means for securing said base around its periphery to a truck bed or the like, said base having a non-circular opening therethrough adapted to receive therewithin one of said supports, an overhanging lip secured to the upper surface of said base around said opening and adapted to retain one of said supports within said opening against vertical displacement, and means for preventing lateral displacement of said one non-circular support through the open end of said base, said last mentioned means being releasable, said last mentioned means comprising a flange depending from the free ends of said base and having an upper edge coplanar with the undersurface of said base, a pin extending outwardly from said flange at right angles thereto, a flat elongated latch member formed at one end with a widened portion having an aperture receiving said pin, said latch member being reduced in width and formed with a curving tail at its other end, a stop pin carried by said flange and disposed in the path of movement of said latch member and adapted to support said latch member curved tail thereon when said latch member is in an inoperative position disposed below the plane of the upper edge thereof, the location of the pivot axis of said latch member being adapted to cause the tail portion thereof to overbalance the widened portion whereby to retain said latch member in the operative position when rotated through 90 degrees away from said stop pin.

---

2,772,858
**POWER HAMMERS**
Francisco Galves, Solvay, N. Y., assignor of one-half to Joseph C. Novack, Syracuse, N. Y.
Application April 25, 1955, Serial No. 503,407
10 Claims. (Cl. 255—39)



4. A power hammer comprising a reciprocating inertia member, a frame including a guide way for said member, a coil spring having one end bearing against said inertia member, and the other secured within said guide way, a single throw crank shaft extending transversely of the axis of movement of said member and journalled on said frame beyond the other end of said coil spring, an articulated connecting rod connecting the throw of said crank shaft with said inertia member to compress said spring, said rod being composed of at least three links serially and pivotally connected on axes parallel with said shaft, rotatable driving means freely rotatable on said crank shaft, means providing for limited relative angular movement between said driving means and crank shaft whereby said crank shaft may accelerate in reference to said driving means in response to spring recoil, said means comprising an arcuate slot on one of said rotatable means and crank shaft, and a crank pin angularly rotatable therewithin on the other, and power means for rotating said driving means at a substantially uniform angular velocity.

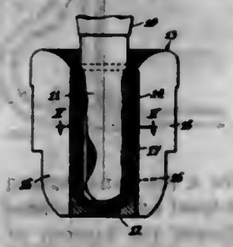
---

2,772,859
**COLLAPSIBLE ENCLOSURE FOR INFANTS**
Rex B. Knorr, Charlotte, N. C.
Application August 21, 1953, Serial No. 375,651
2 Claims. (Cl. 256—25)

1. A collapsible enclosure for infants comprising: a plurality of corner posts, said corner posts being rectangularly spaced to provide a pair of corner posts at each end of the enclosure; flexible stringer means extending from post to post to connect the same together; a series of slats strung upon said stringer means in the spaces between the posts to cooperate with the posts in forming an infant-confining enclosure; end posts dis-

posed between the posts of each end of the enclosure, said end posts being strung upon said means; and swingable brace members carried by the end posts and separably connectible to the corner posts, to provide a rigid bracing assembly at each end of the enclosure adapted for holding the corner posts in upright, stationary positions upon a supporting structure.

---



2,772,860
**VESSEL WITH CONTINUOUS HELICAL LINER**
George A. Nelson, Berkeley, Calif., assignor to Shell Development Company, Emeryville, Calif., a corporation of Delaware
Application July 28, 1953, Serial No. 370,741
2 Claims. (Cl. 257—268)

1. A metallic vessel having a lining formed of a strip of flat protective metal laid helically against the inner surface of the vessel in a plurality of spaced turns so as to leave a helical gap between adjoining turns, the inner surface of said strip being in engagement with said surface of the vessel across the full width of the strip and at least one of the said surfaces being rough to provide a continuous helical passageway between the strip and the vessel, a protective metal covering in said helical gap and including a continuous weldment within said gap connecting each edge of the said strip to the vessel, and at least one hole through the wall of the vessel communicating with the said helical passageway.

---

2,772,861
**RADIATOR FOR ELECTRON DISCHARGE DEVICE**
Hampton J. Dailey, deceased, late of Verona, N. J., by Ruth M. Dailey, executrix, Verona, N. J., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Original application June 29, 1951, Serial No. 234,216. Divided and this application September 28, 1953, Serial No. 382,538
2 Claims. (Cl. 257—263)

1. An electron discharge device comprising a copper anode, an aluminum radiator mounted on said anode, a liner of copper interposed between the anode and radiator, with a fused copper-aluminum bond integrating said liner and radiator as a unit, and solder interposed between said anode and liner securing the said liner on the anode.

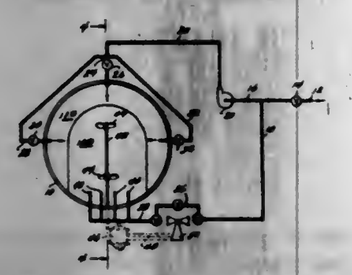
---

2,772,862
**DEVICE FOR THE TRANSMISSION OF MECHANICAL VIBRATIONS TO A MATERIAL MEDIUM**
Harold van Suchtelen, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application February 10, 1954, Serial No. 409,495
Claims priority, application Netherlands February 25, 1953
2 Claims. (Cl. 259—1)

1. A device for treating a material medium with ultrasonic vibrations comprising a pipe having spaced inlet and outlet ports, a ribbon-like member, means for securing said ribbon-like member to opposite ends of said pipe to extend said member substantially parallel to the axis of said pipe, means for adjusting the resonating frequency of said member, a vibrating member, and mechanical means for transmitting vibrations from said vibrating member to said ribbon-like member to vibrate said ribbon-like member in a given number of stationary half-waves.

---

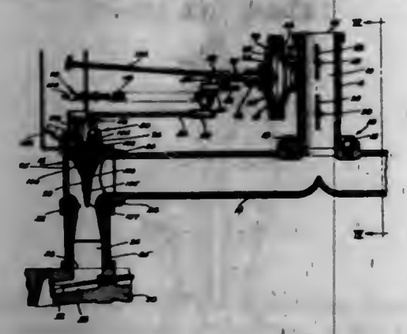
2,772,863
**MIXING PUMP**
Doran B. Harney, Compton, and Wilburn O. Shepherd, Whittier, Calif., assignors to Pacific Pumps, Inc., Huntington Park, Calif., a corporation of California
Application August 30, 1954, Serial No. 453,052
1 Claim. (Cl. 259—7)



In a mixing pump, the combination of: a hollow generally cylindrical housing defining a flow channel for a fluid; a tubular supply conduit for a second fluid extending axially of said flow channel and having threaded radial openings in the side wall thereof; means fixedly supporting said conduit in said housing; openings through the wall of said housing in radial alignment with the threaded openings in said conduit; radially disposed tubes threaded into said threaded openings and communicating with the interior of said conduit, said tubes extending outwardly through said openings in said housing and having closed end portions outside said housing; sealing means between said tubes and the outside of said housing and means on siad tubes, outside said housing, retaining said sealing means in place; openings in the

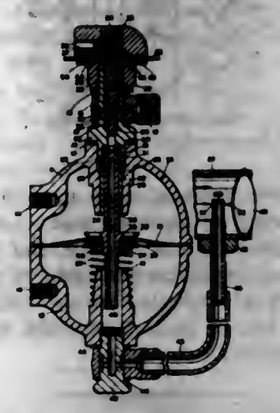
side walls of said tubes within said housing and facing axially of said flow channel in one direction; a shaft journalled in said tubular conduit and extending from an end thereof in said housing; and axial-flow pumping means mounted on said shaft in said housing upstream of said tubes for pumping said fluid through said flow channel in said one direction.

---



2,772,864
**METHOD AND APPARATUS FOR EVACUATING PULP FROM HIGH DENSITY STORAGE TOWERS**
John P. Rich and Arthur L. Whiteside, Nashua, N. H.
Application December 8, 1954, Serial No. 473,982
3 Claims. (Cl. 259—37)

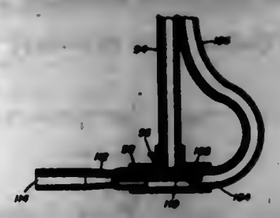
1. In a pulp storage tower, a substantially flat bottom having an outlet formed therein; a plurality of high pressure nozzles penetrating said tower and directed inwardly adjacent said bottom; means for oscillating said nozzles about an axis substantially parallel to the axis of the tower; means for agitating and circulating pulp adjacent said bottom, said means having a suction side and a discharge side; and low pressure nozzles penetrating said tower and directed inwardly toward the suction side of said means.



---

2,772,865
**ENGINE FUEL SYSTEM**
Hugo F. Budzien, Beloit, Wis., assignor to Fairbanks, Morse & Co., Chicago, Ill., a corporation of Illinois
Application June 15, 1953, Serial No. 361,707
4 Claims. (Cl. 261—23)

1. In a fuel system for a multi-cylinder engine having an inlet port for each cylinder, an air intake manifold including an air intake passage in communication with the atmosphere and having spaced openings in communication with said inlet ports, fuel valves disposed adjacent said inlet ports, a throttle valve for said air intake passage of said manifold, a linkage connecting said valves for conjoint operation, a member connected to said linkage and exerting a biasing force thereon in a direction to open said valves, a diaphragm connected to said linkage and subjected to the pressure in said air intake passage on the intake side of said throttle valve, normally effective to exert a force on said linkage system in a direction to closed said valves, and means to vary the amount of biasing force applied to said linkage by said member.

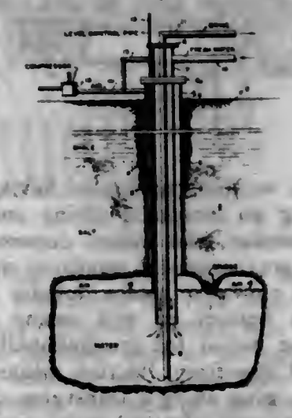


2,772,866
**MEANS FOR SUPPLYING ANTI-DETONANT TO AN INTERNAL-COMBUSTION ENGINE**
John Cecil Ridley, Kenilworth, and Stuart Audley Saxton, Southam, England
Application March 15, 1954, Serial No. 416,322
Claims priority, application Great Britain March 17, 1953
2 Claims. (Cl. 261—44)

1. Means for enabling a predetermined quantity of liquid anti-detonant to be induced into the induction system of an internal-combustion engine in a position where the pressure is sub-atmospheric, said means comprising a casing formed in two portions, a diaphragm peripherally clamped between said casing portions to divide the latter into two chambers, one of said chambers communicating with the atmosphere and the other being sealed, a needle valve controlling an inlet for anti-detonant to said sealed chamber, manual means controlling the degree of opening of said needle valve, a second valve between said needle valve and said sealed chamber, a communication from said needle valve to said second valve, said second valve having a movable member, said movable member fast with said diaphragm and extending therethrough into both said chambers, means biassing said movable member to close said second valve, a guide for said movable member in the chamber which communicates with the atmosphere, said movable member having an internal duct establishing a communication between the downstream side of said second valve and said sealed chamber, an inlet for air at atmospheric pressure into said duct, said movable member when closing said second valve also closing said air inlet, and a communication from said position in said induction system to said sealed chamber whereby, when a sub-atmospheric pressure exists in said position, said diaphragm is deflected against the biassing means to move said movable member to open said second valve and said air inlet for permitting said induction system to inspire a mixture of air and anti-detonant.

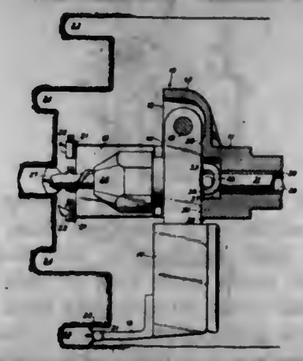
---

2,772,867
**AERATOR**
Howard R. Clechner, Tipp City, Ohio
Application February 11, 1953, Serial No. 336,420
2 Claims. (Cl. 261—77)



1. An aerator for a fish tank having water maintained at a predetermined level and comprising a hollow T member positioned adjacent the bottom of said tank, a vertical air conduit extending from the center connection of said T member to the atmosphere, a venturi element extending from one of the end connections of said T member, a water supply pipe having one end connected to the other of said T member end connections, said water supply pipe end tapering inwardly, and a discharge tube smaller in diameter than said water supply pipe connected to the tapered end of said water supply pipe and extending through said T member into proximity with the throat of said venturi, said venturi being adjacent the bottom of said tank and positioned to direct a jet of water and air parallel to said tank bottom to agitate the water and to remove carbon dioxide therefrom throughout the entire tank.

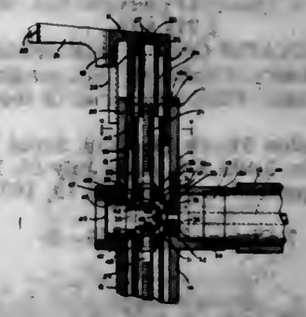
---



2,772,868
**APPARATUS FOR CONTROL OF ROOF LOCATION IN THE FORMATION OF UNDERGROUND CAVERNS BY SOLUTION MINING**
Carl T. Brandt, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Application January 18, 1954, Serial No. 404,476
6 Claims. (Cl. 262—3)

1. An apparatus for underground mining of a soluble material by means of a liquid solvent said apparatus comprising in combination means for introducing solvent into an underground bed of said soluble material, means for withdrawing solvent having soluble material dissolved therein from said bed, means for introducing a non-solvent lighter than said solvent and non-miscible therewith to top of said solvent introduced to said bed, and an open conduit communicating from the desired solvent level in said bed to the atmosphere above the surface of the earth, said conduit being adjustable vertically.

---



2,772,869
**CONTRACTIBLE BORING TYPE CUTTING HEAD FOR CONTINUOUS MINING MACHINE**
Benjamin F. Tracy, Point Pleasant, W. Va., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application May 3, 1955, Serial No. 505,701
9 Claims. (Cl. 262—7)

1. A boring type cutting head for a continuous mining machine of the type having a rotatable hub, an arm supported by the hub, and a cutter bit bracket projecting forwardly from the outer end of the arm; the improvement comprising: a hinge joint connecting the inner end of the arm to the side of the hub opposite the outer end of said arm; said hinge joint including a hinge pin mounted on an extension of the hub which is offset from the hub in a direction opposite the outer end of the arm.

---

2,772,870
**ROTARY BORING HEAD HAVING RADIALLY ADJUSTABLE CUTTING ARMS**
Edward L. Anderson, and Emil J. Hlinsky, Chicago, Ill., assignors to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application January 4, 1956, Serial No. 557,268
4 Claims. (Cl. 262—7)

1. In a rotary boring head comprising a hollow hub and a plurality of radial arms, each of said arms comprising an inner arm portion with a cutter-carrying telescopic end section at the outer end thereof, the inner arm section having a smooth bore opening to its outer end, the telescopic end section having a cylindrical inner end portion with its outer surface slidably engaged in said bore, a hollow sleeve having its inner end fixed centrally of said hub, and having its outer surface in slidable splined engagement with the inner surface of said cylindrical end portions, an inner sleeve fixed on said telescopic end section adapted to project into said splined sleeve, a bushing fixed to said splined sleeve adjacent the axis of said head, a screw member having its outer end threadedly engaged in said inner sleeve, and its inner end journalled in said bushing, and means in said hub for rotating said threaded member to effect adjustment of said telescopic end section relative to said inner arm section.

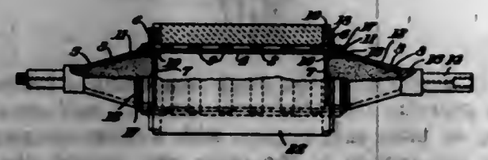
---

2,772,871
**SAFETY ROOF CONTROL APPARATUS FOR CONTINUOUS MINER**
Kenneth E. Caine, Pittsburgh, Pa., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application August 23, 1954, Serial No. 451,352
2 Claims. (Cl. 262—34)

1. In a continuous mining machine having a mobile main frame and a mining head at the forward end thereof for mining coal in a continuous operation without shooting and having an operator's station spaced rearwardly of said mining head, the improvements comprising safety means protecting the operator's station from falling roof comprising a pivoted roof supporting arm pivoted to said main frame adjacent the rear end thereof and extending along the top of said main frame a substantial distance in advance of said operator's station and having an uninterrupted plain top surface accommodat-

ing a timber to be slidably moved therealong, cylinder and piston means connected between said main frame and arm intermediate the ends thereof for elevating said arm, and a timber carrying cradle freely pivoted to the free end of said arm eccentric of the center of said cradle, said cradle having a plate forming a continuation of the top surface of said arm and movable by gravity into position flush with the top surface of said arm when the arm is in a horizontal position and having a flange at the outer end thereof forming a stop for a timber, the eccentricity of said cradle mounting accommodating said cradle to engage a timber with a mine roof in generally parallel relation with respect thereto and to conform to the plane of the roof when holding a timber in engagement therewith.

---



2,772,872

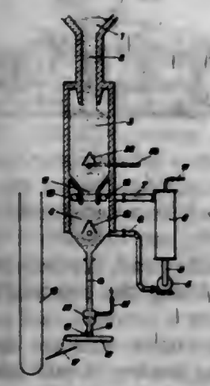
## FURNACE CONVEYOR ROLL

Nathaniel B. Ornitz, Pittsburgh, Pa., assignor to Blaw-Knox Company, Pittsburgh, Pa., a corporation of Delaware

Original application March 11, 1950, Serial No. 149,079, now Patent No. 2,683,578, dated July 15, 1952. Divided and this application December 19, 1951, Serial No. 262,413

7 Claims. (Cl. 263—6)

6. A furnace conveyor roll comprising a body continuous from end to end of the roll and having trunnions at its ends for rotatably supporting the roll, the body having a generally cylindrical central portion, a work-engaging sleeve disposed about and mounted directly upon the generally cylindrical central portion of the body and abutment portions carried by the body engaging the sleeve at the respective ends thereof and fastened to the body to maintain the sleeve in position axially of the body, at least one of said abutment portions interfitting with the sleeve and bearing against the sleeve circumferentially and axially only to hold the sleeve against turning relatively to the body.



---

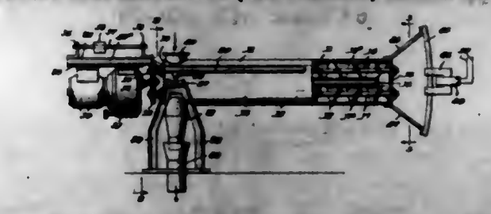
2,772,873

## METHOD OF OPERATING PEBBLE-TYPE HEAT-CARRIERS

Friedrich Dannstadt, Frankfurt am Main, Paul Schmalfeld, Bad Homburg vor der Hohe, and Paul Rudolph, Oberhausen-Holten, Germany, assignors to Metallgesellschaft Aktiengesellschaft, Frankfurt am Main, Germany, a German corporation

Application January 30, 1952, Serial No. 268,988
Claims priority, application Germany February 2, 1951
5 Claims. (Cl. 263—52)

1. In a method for effecting thermal processes in which heat carriers are passed downward through at least one thermal process zone having a pressure in excess of atmospheric, the improvement for discharging the heat carriers from the zone while maintaining the operating pressure in said zone, which comprises establishing a long, narrow, downward discharge path for heat carriers from said zone, and passing heat carriers out of said zone through said discharge path while, simultaneously therewith, passing gaseous medium under pressure through said discharge path in co-current flow with said heat carriers.



---

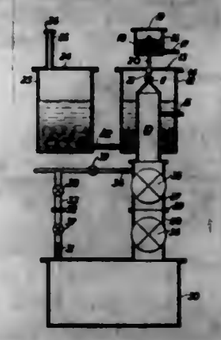
2,772,874

## APPARATUS FOR CONTROLLING FLOWABLE SOLID MATERIALS

Carl W. Brabender, Minneapolis, Minn., assignor to Pillsbury Mills, Inc., Minneapolis, Minn., a corporation of Delaware

Application June 6, 1950, Serial No. 166,442
16 Claims. (Cl. 265—29)

1. Continuous weighing apparatus having a weighing beam comprising an elongated casing containing conveyor means, tubular inlet means disposed on top of said casing for gravitationally supplying material to be weighed to said conveyor means, tubular outlet means disposed at the bottom of said casing coaxial with said tubular inlet means for gravitationally discharging weighed material therefrom, fulcrum means for pivotally supporting said casing along a transverse axis which extends intermediate said inlet and outlet means and intersects a line coinciding with the axes thereof, said tubular inlet and outlet means forming in said casing open areas respectively above and below said conveyor means which extend relative thereto and longitudinally thereof substantially equally from either side of the axis of the respective inlet and outlet means so as to direct the respective gravitationally moving material supplied to said conveyor means and moving for discharge therefrom in substantially vertically effective flows along either side of the transversally extending axis of said fulcrum means to cause said fulcrum means to absorb positive and negative impacts produced by said material respectively supplied to said conveyor means and moving therefrom.



---

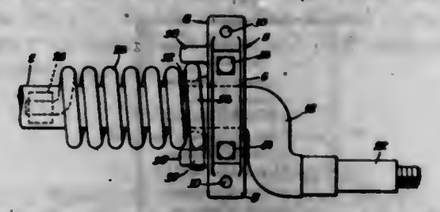
2,772,875

## PRODUCTION OF PURE TITANIUM AND ZIRCONIUM

Joseph Peppo Levy, Acton, London, England

Application February 18, 1953, Serial No. 337,475
5 Claims. (Cl. 266—33)

1. Apparatus for the production of pure titanium which comprises an upright reaction vessel, the upper part of which is surrounded by a closed vessel for holding boiling magnesium, said reaction vessel converging at the top above the level of the molten magnesium in the outer vessel in a venturi throat and disposed centrally above the latter, an inlet pipe passing through the cover of the outer vessel and terminating in a nozzle, said inlet pipe being connected to a supply of argon, the said reaction vessel being also provided with an inlet for titanium tetrachloride passing through the sides of the outer vessel and the reaction vessel and terminating within the latter at a point below the venturi throat, the lower part of the reaction vessel opening into a cooling vessel and receiver, the said cooling vessel and the receiver being provided with an outlet for carrying away argon and excess titanium tetrachloride.



---

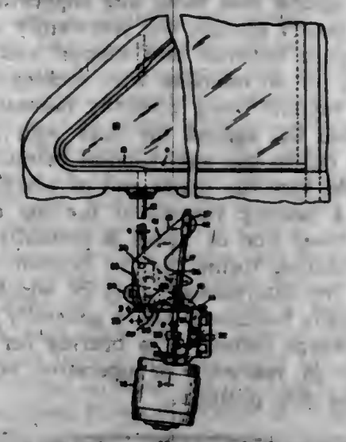
2,772,876

## AXLE BRACKET

Bernard J. McGuire, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey

Application July 22, 1953, Serial No. 369,560
8 Claims. (Cl. 267—58)

7. As an article of manufacture, a bearing base for use in an axle asembly of the type described, said base partially defining a journal opening, lugs fixedly secured to the base on opposite sides of the opening, a spring shelf disposed between and spaced from said lugs, said lugs extending from one side of said base to engage a coil of a spring against said shelf, said base being formed and arranged for use on either end of said axle assembly.



---

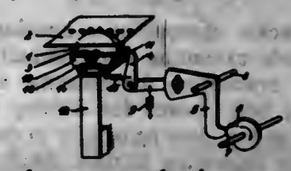
2,772,877

## POWER OPERATED MECHANISM FOR VEHICLE BODY VENTILATOR WINDOWS

Joseph Pickles, Dearborn, Mich., assignor to Ferro Stamping Company, Detroit, Mich., a corporation of Michigan

Application October 18, 1954, Serial No. 462,821
7 Claims. (Cl. 268—120)

1. A power operated ventilator window assembly comprising a pivot shaft supported for rotation about a substantially vertical axis, a ventilator fixed to said pivot shaft and movable by said shaft about its axis, a first toothed sector fixed to said pivot shaft and occupying a plane perpendicular thereto, a mounting bracket, an electric motor having a drive shaft, a threaded shaft coupled to said drive shaft, means mounting said motor, drive shaft, and threaded shaft on said bracket for limited rocking movement with respect thereto in a plane containing said drive shaft and threaded shaft which plane is substantially parallel to the axis of said pivot shaft, a nut on said threaded shaft, a second toothed sector pivotally mounted on said bracket for rocking movement about an axis perpendicular to and intersecting the axis of said pivot shaft, the teeth of said sectors being meshed, and an operating arm on said second sector pivotally secured to said nut.



---

2,772,878

## DEVICE FOR ADVANCING TAPE RECORDS IN TELEGRAPH APPARATUS

Herbert Wüsteney, Munich-Thalkirchen, Josef Bauder, Munich-Solln, and Robert Stubenau, Berlin-Spandau, Germany, assignors to Siemens & Halske Aktiengesellschaft, Berlin and Munich, Germany, a corporation of Germany

Application October 9, 1952, Serial No. 313,962
Claims priority, application Germany October 29, 1951
2 Claims. (Cl. 271—2.4)

1. In a telegraph apparatus having a perforated tape, a device for advancing said tape step-by-step and for controlling and securing the stepwise advance thereof substantially free of blacklash, said device comprising a stationary shaft, a sprocket wheel freely rotatable on said shaft, said sprocket wheel having teeth for engaging perforations in said tape, a pawl disposed alongside said sprocket wheel, means for resiliently biasing said pawl in a direction radially inwardly of said sprocket wheel to cause the free end thereof to assume a normal position between two adjacent sprocket teeth, means for reciprocating said pawl to impart thereto successive drive strokes during each of which said pawl exerts a driving force on a sprocket tooth engaged thereby so as to rotate said sprocket wheel by one step and to advance said tape accordingly, said pawl sliding during the return stroke thereof along a sprocket tooth to its normal position from which it is subsequently moved to execute the next successive drive stroke thereby exerting a force on said sprocket wheel tending to rotate it in opposite backlash direction, and a movable generally semicircular generally flat brake member in resilient frictional engagement with one side of said sprocket wheel along an area thereof which includes only a portion thereof lying below said stationary shaft to counteract said backlash force so as to hold said sprocket wheel in any angular position to which it had been advanced during the corresponding drive stroke of said pawl.

---

2,772,879

## AUTOMATIC CENTERING APPARATUS

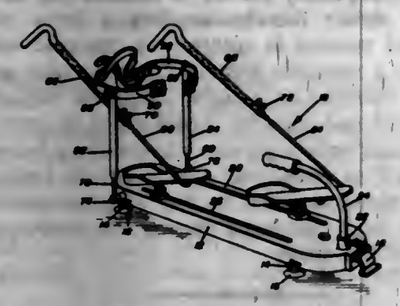
Edwin T. Lorig, Pittsburgh, Pa., assignor to United States Steel Corporation, a corporation of New Jersey

Application September 17, 1953, Serial No. 380,646
3 Claims. (Cl. 271—2.6)

1. Apparatus for automatically centering an object passing thereover comprising a rotatable member having an outer peripheral surface adapted to contact said object, said member having a radial separation on a trans-

verse central plane extending to its outer periphery, a plurality of flexible laminations of one material on its outer periphery arranged on both sides of said transverse central plane, means for causing said laminations to rotate in unison, said laminations normally being in contact with one another but being movable with respect to each other and being inclined radially toward the axis of the roll away from the said transverse central plane.

---



**2,772,880**
**SHEET STACKER**
**Elmer E. Garrett, Freeport, N. Y., assignor, by mesne assignments, to E. G. Staude Manufacturing Company, Inc., Concord, N. H., a corporation of New Hampshire**
**Application March 5, 1953, Serial No. 340,586**
**5 Claims. (Cl. 271—74)**

1. A sheet stacker comprising a housing having a slot in its bottom side extending longitudinally of the housing, means for evacuating the housing, an endless perforated stacking belt, means for driving the belt longitudinally under and in close proximity to the said slot, conveyor means for delivering flexible sheets in overlapped relation to the underside of the receiving end of said belt whereby the leading exposed portion of each sheet is successively held against the belt by suction as it passes underneath the slot and is released from the belt as it leaves the slot, and stop guides for the sheets disposed angularly with respect to the path of said belt and sheets, one of said stop guides being parallel to the leading edge of the sheets and located in advance of the slot a distance substantially equal to the length of the leading exposed portions of the sheets.

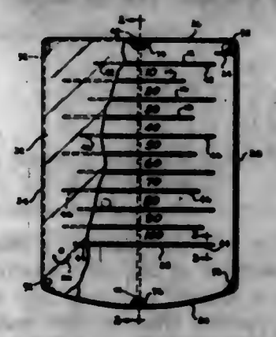
---

**2,772,881**
**EXERCISING APPARATUS**
**Earl H. Fundeen, West Liberty, Ohio; Doris Jane Fundeen, executrix of said Earl H. Fundeen, deceased**
**Application January 21, 1954, Serial No. 405,276**
**6 Claims. (Cl. 272—58)**

1. An exercising apparatus comprising a base having a pair of spaced slots therein, a pair of pulleys rotatably mounted below said base, an endless belt entrained about said pulleys with bight portions of said belt positioned below said slots and in alignment therewith, clamp members engaging said bight portions and extending upwardly through said slots, and pedals adjustably pivotally mounted on said clamp members.

---

**2,772,882**
**BALL HOLDER**
**Robert F. Anson, Delaware, Ohio**
**Application September 28, 1953, Serial No. 382,560**
**1 Claim. (Cl. 273—26)**



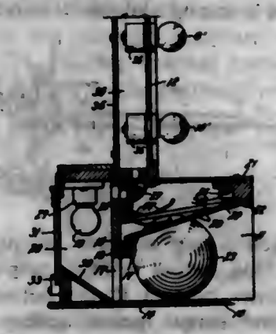
For use in sports apparatus, a ball holder comprising a bag having an open upper end permitting ingress and egress of a ball, a drawstring carried by an upper part of said bag selectively reducing the size of said open upper end to retain a ball in said bag, opposed straps secured to said bag and projecting upwardly from said

upper part as a continuation thereof, and aligned eyes in the ends of said straps for receiving an attaching member.

---

**2,772,883**
**TILTING GAME BOARD**
**Joseph J. Schigas, Erie, Pa., assignor to Louis Marx & Company, Inc., New York, N. Y., a corporation of New York**
**Application March 6, 1953, Serial No. 340,843**
**4 Claims. (Cl. 273—110)**

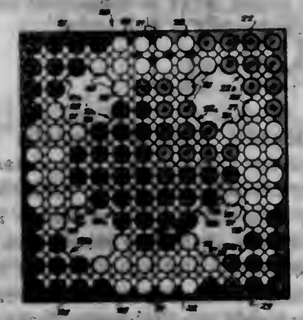
3. A rockable ball-control game device comprising a single generally upright body of molded transparent plastic comprising a front wall and edge walls, a series of collateral shelf-like guide walls terminating at both ends short of the edge walls for passage of a ball, the ends of some of said walls being offset relative to the ends of others to permit rolling of a ball from an upper shelf to a lower shelf, said shelves being formed integrally with the front and edge walls and projecting rearwardly therefrom, a back wall stamped out of sheet material appropriately printed with score values, means to secure the back wall in position, and a support projecting rearwardly from the back wall of the game device for bearing against said table and supporting the game device in a nearly upright but rearwardly sloping position, the contact between said support and table being so limited as not to interfere with rocking of the game device, said support being pivotally mounted so that it may be folded flat against the back wall of the game device when not in use, said support comprising a piece of heavy rigid wire the upper end of which is pivotally received in a bearing formed at the top of the game device, the lower end of which is pivotally received in an aligned bearing formed at the bottom of the game device, and the intermediate part of which is bent to form a generally horizontal and a generally upright side, and detent means formed at a bearing for holding the wire support in rearward or operative position when turned out to that position.



---

**2,772,884**
**SIMULATED BOWLING GAME DEVICE**
**Robert Harvey Galbreath, Denver, Colo.**
**Application September 14, 1953, Serial No. 379,841**
**7 Claims. (Cl. 273—127)**

1. A simulated bowling game comprising: an elongated housing adapted to be positioned transversally of the path of a rolling ball; a plurality of aligned illuminated target windows in said housing; an elongated open-fronted,

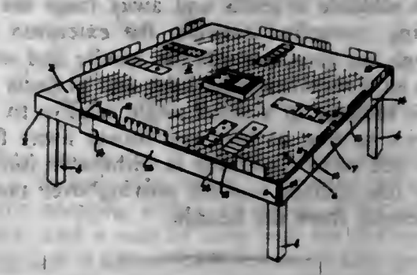


ball-receiving chamber positioned forwardly of said windows; a floor in said chamber; a plurality of hinged flaps forming the ceiling over said ball-receiving chamber, there being one of said flaps positioned forwardly of and above each window, said flaps being positioned relative to said floor so that when said ball rolls onto said floor, it will

wedge between the floor and one of said flaps so as to force the flap upwardly; signal lamps; and an electric switch positioned to be actuated in consequence of the upward movement of each of said flaps, each of said switches being in circuit with one of said signal lamps so as to give an indication when the flap associated therewith is swung upwardly.

---

**2,772,885**
**GAME APPARATUS**
**George F. Wales, Kenmore, N. Y.**
**Application December 15, 1952, Serial No. 325,999**
**1 Claim. (Cl. 273—131)**



A game apparatus comprising a gameboard having a generally polygonal playing surface comprising a central area divided into a plurality of spaces for movement of gamepieces, and a plurality of corner areas disposed wholly outside said central area and each divided into a number of spaces for gamepieces, the number of spaces in the several corner areas being equal, said central area being divided into as many sections as there are corner areas, each section having as many spaces as a corner area, the spaces in each corner area being triangularly arranged with the space which constitutes the apex of the triangle being disposed in a corner of the playing surface, the spaces in each section also being triangularly arranged, each of the several corner areas bearing different indicia differing from the indicia borne by other corner areas, and each of the several center sections bearing different indicia differing from the indicia borne by the other center sections, but the indicia of the different center sections being the same as, respectively, the indicia of the several corner areas, respectively, the triangle, in which the spaces of a center section are arranged, being inverted with reference to the triangle, in which the spaces of the corner area, which bears the same indicia, are arranged, the base of the triangle of each center section being parallel to the base of the triangle of the corner area which bears the same indicia, and the spaces constituting the apices of the two triangles which bear the same indicia being remote from one another, and a plurality of gamepieces for playing a game on said gameboard, said gamepieces being divided into as many sets as there are corner areas of the gameboard, each set of gamepieces bearing the same indicia but the different sets of gamepieces bearing indicia differing, respectively, from the indicia borne by the other sets of gamepieces, and the indicia of the several sets of gamepieces being, respectively, the same as the indicia borne by the several corner areas, respectively.

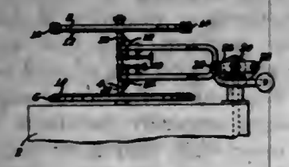
---

**2,772,886**
**CARD TABLE COVERS**
**Walter B. Parmele, Minnetonka Beach, Minn.**
**Application November 10, 1954, Serial No. 468,046**
**2 Claims. (Cl. 273—136)**

1. A flexible attachment for a card table, said card table having a flat top surface bounded by a surrounding narrow edge portion depending vertically therefrom, said edge portion having a plurality of straight side portions and a vertically disposed corner at each juncture of said side portions, comprising: a flexible skirt formed to overlie and snugly fit said edge portion all around said table, said skirt comprising a plurality of sections, one for each of said side portions, each said section comprising an inner wall for overlying one of said side portions and an outer wall attached to the lower edge of said inner wall and extending upwardly therefrom substantially the height of said inner wall, said outer wall being attached to said inner wall between the top and bottom thereof at points spaced along said section to form narrow vertically disposed pockets open at the top and adapted to hold playing cards with their upper portions extending above the top of said section so that the indicia of said cards is visible, said section having opposite end edges shaped to lie rsepectively along the vertically disposed corners at the opposite ends of said one of said side portions, and means for holding said skirt against said narrow edge portion with each said skirt section end edge in position closely adjacent the respective corners of said edge portion.

---

**2,772,887**
**INSTRUCTIONAL DEVICE FOR USE IN CONNECTION WITH BALL GAMES**
**Minden Vaughan Blake, London, England**
**Application October 30, 1953, Serial No. 389,383**
**Claims priority, application Great Britain November 12, 1952**
**7 Claims. (Cl. 273—186)**



1. A device for discovering the way in which a player swings a club, bat, racket or the like comprising a handle, a parallel-sided hollow extension of the handle rigidly connected to the handle and having an axially-extending slot in the wall thereof, a weighted ring slidably mounted on the extension for movement towards and away from the handle, a movable stop located on the extension and provided by at least one member one end

of which, in one position, is spring urged to project through said slot such that the end lies in the path of the weighted ring and in another position the end is withdrawn into said extension such that it lies out of the path of said ring, a fixed abutment on the extension which fixed abutment is located on the side of said movable stop remote from said handle and projects from the surface of the extension into the path of the weighted ring so as to prevent said ring sliding off the extension, and automatic control means connected to the other end of said member and operative to move said member so that the first said end lies out of the path of the weighted ring at a particular angular velocity, which automatic control means comprises a mass connected to said other end of said member, which mass is contained within said extension and is slidable towards and away from the handle, and a spring connected between the extension and the mass to urge the mass towards the handle and wherein a surface on said member, when the end projects through said slot, is inclined at a small angle relative to the axis of the device so that as the mass moves away from the handle the end of said member is withdrawn into the extension by the inclined surface moving over the end of said slot remote from the handle.

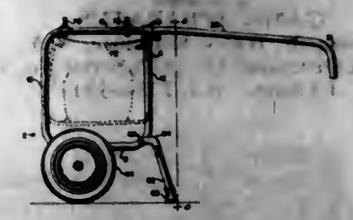
2,772,888
## MANUFACTURE OF STEREOPHONIC PHONOGRAPH RECORDS
Daniel P. Doncaster, Long Island City, N. Y., assignor to Columbia Broadcasting System, Inc., New York, N. Y., a corporation of New York
Application December 18, 1952, Serial No. 326,706
11 Claims. (Cl. 274—46)

1. The method of manufacturing a phonograph record of flat disk shape having on its opposite faces two stereophonically related recordings adapted to be played back with reproducing styli engaging said record along a line parallel to the axis thereof which comprises cutting spiral sound grooves in two master records rotated at the same angular speed by transducers energized with trains of oscillations respectively representative of stereophonically related versions of the same sounds, stereophonically related oscillations in said trains arriving simultaneously at the styli of said transducers, cutting in said master records phasing grooves by means of transducers energized with trains of substantially sinusoidal oscillations of a common audio frequency and of known phase relation at said transducers and having a discontinuity of time separation known to a tolerance not exceeding one cycle of said frequency, no other than equal angular rotations of said master records intervening between the cutting of said spiral sound grooves and phasing grooves, reproducing the trains of sinusoidal oscillations represented by the phasing grooves, and indexing said master records in accordance with the trains of sinusoidal oscillations at points of known spacing circumferentially of said master records with respect to stereophonically related undulations in said spiral grooves.

---

2,772,889
## WHEELED SUPPORT FOR CONTAINERS
Scott E. Reynolds, Sunnyvale, Calif.
Application March 10, 1955, Serial No. 493,345
5 Claims. (Cl. 280—35)



1. A wheeled support for a can-type container having a downwardly extending bottom flange thereon, comprising a plurality of radially extending arms, means pivotally connecting the inner ends of said arms to each other, a caster mounted on the outer end of each arm, each caster comprising a pintle mounted on the arm and extending upwardly therefrom, a caster support wheel swiveled to each pintle, a clamp member mounted on the outer end of each arm and slidable relative to the caster

pintle thereon, each clamp member having an upwardly extending jaw portion spaced from its respective pintle to receive the container bottom flange between the flange and the pintle, and screw means acting between each pintle and its clamp member to move the jaw portion relative to the pintle to grip the container bottom flange therebetween.

---

2,772,890
## MAIL SACK CARRIER CART
Frank A. Gastright, Fort Lauderdale, Fla., assignor, by mesne assignments, to Morris Weintraub, Newport, Ky.
Application May 26, 1954, Serial No. 432,555
4 Claims. (Cl. 280—40)

1. A foldable cart adapted normally to be rolled along the ground for transporting a mail sack of the type utilized by letter carriers, and being foldable to fit within a mail or relay box, comprising a frame having spaced upper and lower bars extending lengthwise of the direction of cart movement and spaced front and rear bars respectively joined to the upper and lower bars, a pair of wheels, deformable parallelogram linkage retractably mounting said wheels on the lower bar for swinging between an extended position in which said wheels extend downwardly and outwardly from the lower bar and a retracted position in which said wheels are disposed upwardly from the lower bar and inwardly alongside said frame, a handle, means for removably attaching said handle to the frame adjacent the juncture of the upper and rear bars, a retractable ground-engaging post pivoted to said frame adjacent the juncture of the lower and rear bars, said post being pivoted between an extended position in which it extends downwardly from the frame and a retracted position in which it lies alongside the frame, and a pair of spaced pegs extending upwardly from the top bar for hangingly supporting an upper portion of a mail sack whereby the body of the sack hangs downwardly alongside the frame.

---

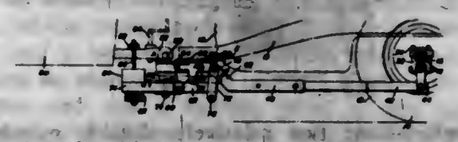
2,772,891
## VEHICLE SPRING AND END CONNECTION ARRANGEMENT
Fred D. Bonnin, Malaga, Calif.
Application April 1, 1955, Serial No. 498,554
3 Claims. (Cl. 280—124)

1. In a spring suspension system for a vehicle having an elongated leaf spring having transversely flat upper and lower surfaces and opposite end portions, means pivotally mounting the spring intermediate its ends in supporting relation on the vehicle with the ends of the spring

forwardly and rearwardly extended from the mounting means, means interconnecting the forward end portion of the spring and the vehicle resiliently resisting pivotal movement of the spring, and an axle transversely disposed beneath the rearward end portion of the spring, said rearward end portion of the spring being of substantially uniform thickness for an appreciable distance forwardly from the extreme rearward end thereof; the combination of a bearing bracket mounted on the axle in supporting relation to the rearward end portion of the

spring, said bracket having a pocket therein defined in part by a flat bottom wall receiving the spring flatly thereagainst and a transversely downwardly convex top wall engageable downwardly against the upper surface of the spring along a line longitudinally of the spring, and means connected to the bearing bracket and to the vehicle holding the bearing bracket against sliding movement longitudinally of the spring but accommodating rocking movement of the bracket transversely of the spring.

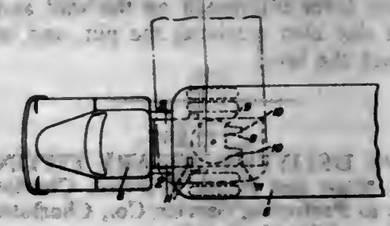
---



2,772,892
## LOAD DISTRIBUTING GOOSENECK FOR LOW BED TRAILER
Glenn F. Hake and James D. Hake, Philadelphia, Pa.
Application December 6, 1954, Serial No. 473,186
6 Claims. (Cl. 280—405)

1. A tractor-trailer train comprising a low bed trailer adapted to carry heavy loads, said low bed trailer having a low hung platform supported by a front extension and a rear extension integral with said low bed trailer, spring means positioned at the rear end of said platform, a fulcrum support on said rear extension of the low bed trailer, a walking beam supported on said fulcrum, said walking beam having its front end extending over said spring means, said spring means being adapted to exert a predetermined upward thrust on said walking beam, the rear end of said walking beam being provided with a fifth wheel, said fifth wheel being supported upon a wheeled vehicle for supporting the load transmitted by said walking beam.

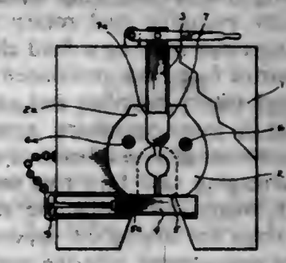
---



2,772,893
## LOAD EQUALIZING TRAILER HITCH
Lee Emile Wettstein, Madison, Ind.
Application July 23, 1954, Serial No. 445,247
6 Claims. (Cl. 280—406)

1. A trailer hitch comprising a bifurcated frame, hinge members adapted to connect said frame to the axle housing of a vehicle, a reach member longitudinally adjustable on said frame, a hinge bar vertically swingable on the end of said reach member, a hook bar mounted on said hinge bar to swing therewith, a transverse bar on said hook bar adapted to engage the frame of a vehicle, a toggle arm hingedly connected to said reach member and to said hinge bar, said toggle arm extending rearwardly of said hook bar, a resilient connection adjacent the end of said toggle arm adapted to adjustably engage a trailer, and a hitch member on said hook bar for coupling to a corresponding hitch member on a trailer tongue.

---

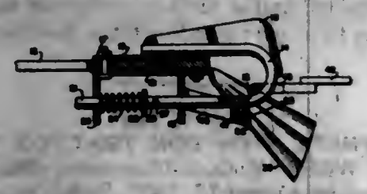


2,772,894
## FIFTH WHEEL STOP FOR TRACTOR TRAILERS
William K. Oats, Claremore, Okla.
Application August 25, 1954, Serial No. 452,080
1 Claim. (Cl. 280—432)

A safety device for a tractor trailer combination including a forked fifth wheel coupling carried by the tractor for coupling with a pivot pin at the underside of the trailer, and a pair of stop lugs on the underside of the trailer and at substantially diametrically opposite sides of the pivot pin and engageable with opposite sides of the fork of the coupling to limit turning movement of one part of the tractor trailer combination relative to the other.

---

2,772,895
## FIFTH WHEEL SAFETY LOCK
Walter D. Steeves and Raymond V. Meaden, Vancouver, British Columbia, Canada
Application October 19, 1954, Serial No. 463,209
2 Claims. (Cl. 280—432)

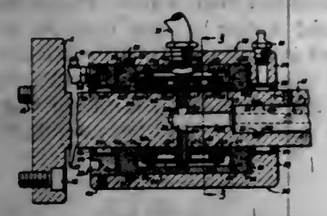


1. In a coupling means for a trailer and tractor vehicle having a fifth wheel plate on the tractor vehicle and a king pin on the trailer for engagement in a slot in the fifth wheel plate, a pair of parallel clamping members pivotally mounted intermediate their ends on the fifth wheel plate having jaws in the confronting edges of their forward ends for engagement with the king pin of the trailer, a locking bar slidably mounted on the fifth wheel plate for longitudinal movement between the rear ends of said clamping members to hold the forward ends of said clamping members in engagement with the king pin, and a second locking bar slidably mounted on said fifth wheel plate for transverse movement across the slot of the plate in bearing engagement with the forward ends of said clamping members for holding said members against pivotal movement.

---

2,772,896
## SELF-COUPLING TRACTOR HITCH MEMBER OPENED BY COMPLEMENTARY HITCH MEMBER
Ronald J. Kemper, Defiance, Ohio
Application April 14, 1954, Serial No. 423,125
2 Claims. (Cl. 280—510)

2. A hitch comprising complementary coupling members, a wall rigidly connected to one of said coupling



members, a keeper biased to a closed position on said one member, a pin laterally projecting from the keeper, said wall adjacent the keeper having a guide slot through

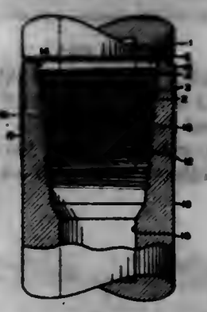
which the pin projects and moves back and forth with the keeper, a trip lever fulcrumed on the wall and having a curved cam slot also receiving the pin, and means connected to rock the lever.

---

**2,772,897**
**SIDE DELIVERY ROTARY FITTING**
**Harmon L. Shaw and Frank E. Frost, Charlotte, N. C., assignors to Perfecting Service Co., Charlotte, N. C., a corporation of North Carolina**
**Application July 27, 1953, Serial No. 370,590**
**6 Claims. (Cl. 285—190)**

1. A side delivery rotary fitting comprising a housing, a rotary member mounted in and extending through said housing and having a fluid passageway therein communicating with the interior of said housing, a pair of spaced combination sealing and bearing rings fixed in said housing and frictionally engaging said rotary member, said sealing and bearing rings defining a fluid chamber within said housing, a pair of face rings positioned in said chamber and about said rotary member and each having an annular groove in its inner periphery, a resilient O-ring positioned in the annular groove of each of said face rings and frictionally engaging said face ring and said rotary member, resilient means contacting the proximate surfaces of the face rings and urging the opposed surfaces of the face rings into engagement with the sealing and bearing rings, a drive drum positioned around said rotary member, means connecting the rotary member and the drive drum, the drive drum being keyed to the external surfaces of the face rings to cause the same to rotate with the rotary member while permitting axial movement relative thereto, and means for introducing fluid through said housing and into said fluid chamber.

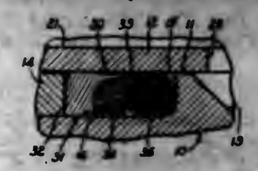
---



**2,772,898**
**QUICK DISCONNECT COUPLING FOR HIGH PRESSURE GAS OR LIQUID**
**Henry W. K. Seeler, Dayton, Ohio, assignor to the United States of America as represented by the Secretary of the Air Force**
**Application August 30, 1951, Serial No. 244,445**
**2 Claims. (Cl. 285—190)**
**(Granted under Title 35, U. S. Code (1952), sec. 266)**

1. A coupling for connecting conduits carrying a high pressure fluid comprising, a male member having a first and a second cylindrical member in axial alignment separated from each other by a first groove, said first cylindrical member having a diameter slightly smaller than said second cylindrical member, said male member having a first bore connecting with said first groove and adapted to be connected with a conduit, a female member having second and third bores slidably receiving said first and second cylindrical members on said male member, a second groove in said female member radially disposed about said first groove in said male member when in coupled relationship, a fourth bore within said female member adapted to be connected to a conduit, means forming a passage between said second groove and said fourth bore, whereby pressure within said first and second grooves tends to separate said male and female members by a force proportional to the difference in the diameters of said first and second cylindrical members on said male member, and quick release means for releasably securing said male and female members together.

---



**2,772,899**
**THREADED OIL WELL DRILL STEM CONNECTION WITH THE THREADS HAVING INCLUDED CREST ANGLE OF 90 DEGREES**
**Seth Evans, Houston, Tex., assignor to Hughes Tool Company, Houston, Tex., a corporation of Delaware**
**Application May 15, 1948, Serial No. 27,247**
**3 Claims. (Cl. 285—333)**

3. An improved oil well drill stem threaded connection of the shouldered pin and box type comprising, interfitting, tapered pin and box members having complemental transverse radial shoulders in compression when the joint is made up, interfitting V-type threads on said members, the flanks of the threads on the members being complemental and adjacent flanks on each member converging at an angle of approximately 90°, whereby tightness in excess of a predetermined minimum is maintained after relaxation of the made up connection.

---

**2,772,900**
**SEALING DEVICE**
**Rodney B. Campbell, Glendale, Calif., assignor, by mesne assignments, to Wm. R. Whittaker Co., Ltd., Los Angeles, Calif., a corporation of California**
**Application January 2, 1953, Serial No. 329,385**
**3 Claims. (Cl. 286—26)**

1. In combination: two relatively slidable members one having therein a groove which faces the other of said members and which extends transversely of the direction of relative sliding movement of said members, said groove having bottom and side walls; a sealing element of substantially L-shaped cross section disposed in said groove, said sealing element having a rigid base which engages the bottom wall and a side wall of said groove and having a flexible, resilient flange provided

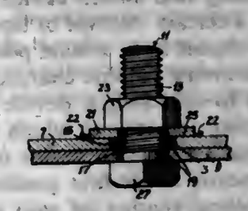
with a concave side which faces and engages said other member, said base and said flange including substantially a right angle therebetween and providing a recess therebetween; and a compressible packing element in said recess and engaging the other side of said flange and the bottom wall of said groove, said packing element being compressible toward said base under pressure existing between said members so as to expand transversely of said direction to deflect said concave side of said flange into sealing engagement with said other member and to flatten said concave side of said flange against said other member.

---

**2,772,901**
**WINDOW REGULATOR CONNECTING MEANS**
**John H. Roethel, Coral Gables, Fla.**
**Application November 24, 1954, Serial No. 470,856**
**2 Claims. (Cl. 287—3)**

1. Connecting means for an end of a swinging regulator arm having a transverse stud secured to the end of the arm, comprising a unitary member having a front vertical wall formed with a longitudinal channel to provide vertically spaced upper and lower longitudinally extending generally horizontal bearing walls terminating at their outer edges in a single upright back wall joining said edges together, said back wall being formed with a longitudinal slot receiving said stud, a bearing element, said bearing element comprising a cup shaped cylindrical member having its outer cylindrical surface in bearing engagement with said bearing walls, a flange portion engaging the front wall of said unitary member and a sleeve portion journalling said cylindrical bearing means on said stud, and spring means carried by said stud between said regulator arm and an interior portion of said cylindrical member, said spring means overlying said sleeve portion and maintaining the regulator arm in spaced relation to said unitary member and holding said bearing element within said bearing surfaces.

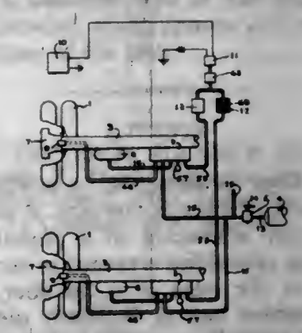
---



**2,772,902**
**SWIVEL CONNECTOR**
**Franklin C. A. Lind, Randolph, Minn.**
**Application August 20, 1952, Serial No. 305,447**
**5 Claims. (Cl. 287—91)**

1. A swivel connector for joining in relatively rotatable relation two articles such as a fishline and a fish lure which comprises a body having a fastener at one end and a bearing surface at the other end, a spindle having an elongated and reduced shank with a fastener at one end and a bearing point at the opposite end thereof, at least one of said spindle bearing point and said body being magnetized and the other being constructed of magnetically attractable material, the spindle bearing point and the body bearing surface normally being in low friction rotative bearing contact, casing means attached to said body and surrounding said spindle in close clearance therewith and in opposed relation with respect to the spindle bearing point at the elongated and reduced shank, whereby, upon divergently pulling the respective fasteners of the body and of the spindle, the spindle bearing point and the bearing surface will be separated and the casing and the spindle will be brought into rotative bearing engagement.

---



**2,772,903**
**SEALING MEMBER**
**Paul S. Sussenbach, Brentwood, Mo., assignor, by mesne assignments, to American-Marietta Company, Chicago, Ill., a corporation of Illinois**
**Application January 17, 1951, Serial No. 206,358**
**1 Claim. (Cl. 288—20)**

A sealing member for use with a fastener such as a screw fastener, comprising a washer formed of a soft, tacky, extrudable sealing material having such plasticity that it maintains its shape under normal handling but which will cold-flow under pressure with permanent deformation, with the flow characteristic of the sealing material such as to permit cold extrusion thereof into voids around a fastener and from between metal parts that are forced together by the fastener, said sealing material consisting of approximately 8.4 parts by weight of a copolymer of butadiene and styrene containing 23.5% styrene, 8.4 parts by weight of polyisobutylene having an average molecular weight of approximately 11,000, 56.8 parts by weight of blown asphalt having an MP of 240 and an NP of 2.5 mm., 0.3 parts by weight of trimethyl dihydroxy quinoline, and 26.1 parts by weight of filler.

---

**2,772,904**
**BRAKE CONTROL APPARATUS**
**Charles Doolittle, Pittsburgh, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania**
**Application December 29, 1954, Serial No. 478,311**
**9 Claims. (Cl. 291—2)**

9. A brake control apparatus comprising, in combination, a brake application device operable in response to fluid pressure for effecting a brake application on a vehicle wheel and to relief of such pressure for releasing said brake application, a sanding device operable in response to electrical energization for causing sand to be discharged immediately in front of the vehicle wheel and in response to deenergization for stopping said discharge of sand, a fluid pressure operable switch device responsive to fluid pressure and to release of fluid pressure for effecting closing and opening, respectively, of an electrical circuit for energizing and deenergizing said sanding device, a source of fluid under pressure, conduit means providing for flow of fluid under pressure from said source to

said brake application device and said switch device, first valve means interposed in said conduit means and having a control chamber charged with fluid under pressure from said conduit means, said valve means including a unitary valve element operable, in response to fluid pressure in said control chamber, to a normal position in which fluid pressure may be supplied to said brake application device and cut off from said switch device and, in response to venting of fluid pressure from said control chamber, to a release position in which said brake application device is relieved of fluid pressure and said pressure switch is supplied with fluid pressure, timing means operable automatically for causing said switch device to maintain said circuit closed for a certain interval of time upon operation of said first valve means to its release position, said timing means including a timing volume charged with fluid under pressure supplied to said switch device and check valve means for restricting the rate at which fluid under pressure is vented from said switch device upon operation of said first valve means to its first position, second valve means for controlling venting of said control chamber, and a control device for operating said second valve means, said control device being responsive to a slipping of said wheel for operating said second valve means to cause venting of said control chamber and responsive to cessation of said wheel-slipping for operating said second valve means to a position in which venting of said control chamber is cut off.

---

2,772,905

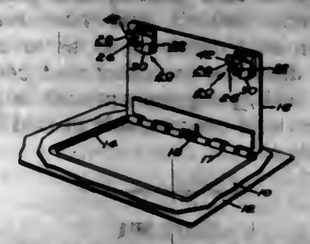
## DOOR LATCH MECHANISM

Leon F. Dusing, Kenmore, N. Y., assignor to Dusing and Hunt, Inc., Buffalo, N. Y.

Application July 14, 1954, Serial No. 443,219

7 Claims. (Cl. 292—36)

1. In a fire-door construction, a multiple latch bolt door locking arrangement comprising a main latch bolt assembly operably connected to a plurality of supplemental latch bolt assemblies arranged in vertically aligned relation adjacent the edge of a fire-door, each of the latch bolt assemblies having resiliently outwardly urged bolt means and pivotally mounted bell crank means having one arm of each thereof in engagement with said bolt means, the opposite arms of said bell crank means being pivotally interconnected by a link member for simultaneous movements thereof, said main latch bolt assembly being offset laterally away from the inside door face out of alignment with the supplemental latch bolt assemblies whereby the bolt means of said main latch bolt assembly will strike its keeper plate in advance of the arrival of the bolt means of the supplemental latch bolt assemblies at their respective keeper plates, whereby the bolt means in said main latch bolt assembly will be retracted upon striking its keeper plate and thereby simultaneously retract the bolt means of the supplemental latch bolt assemblies out of contact with their respective keeper plates.



2,772,906

## LOCK FASTENER

Stanley W. Esmond, Buffalo, N. Y., assignor to Bell Aircraft Corporation, Wheatfield, N. Y.

Application October 26, 1953, Serial No. 388,117

2 Claims. (Cl. 292—212)

1. A fastener device for a door mounted in relation to a door frame comprising, an anchor block mounted adjacent the edge of the door and having upstanding shoulder means thereon, an elongated locking bar having a centrally located boss formed with a threaded aperture, and a screw journaled through the door and said anchor block and engaged in threaded relation with said boss through said locking bar member, whereby turning of said screw rotates said locking bar member within limits defined by said anchor block shoulder means to alternately engage and disengage a portion of the door frame, said anchor block being provided with stepped bearing lands adjacent said upstanding shoulder means thereof, said screw extending through the lower of said lands and one end of said locking bar member bearing on an intermediate land and the other end of said locking bar member bearing against the higher of said lands when said locking bar member is in door frame engaging position, whereby self-locking and self-unlocking of said locking bar member in door frame engaged position is facilitated and whereby continued turning of said screw after said locking bar member is in door frame engaging position will resiliently flex said locking bar member between its ends.

---

2,772,907

## TOGGLE-OPERATED CLOSURE FASTENER

William F. Paste, Chicago, Ill., assignor to Continental Can Company, Inc., New York, N. Y., a corporation of New York

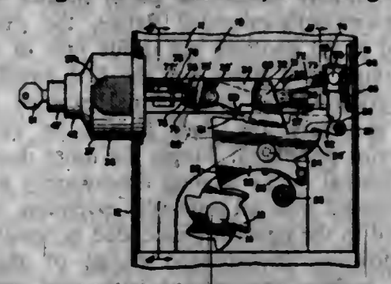
Application November 4, 1953, Serial No. 390,167

6 Claims. (Cl. 292—256.69)

1. A locking cover for a drum or the like having a depending peripheral skirt having spaced parallel tongues curled ends for the tongues, a flexible wire held in the said curled ends, the ends of the wire being formed as hooks, a toggle-plate overlying the skirt and having a depending outwardly offset central portion, laterally spaced bearings on the plate and a link connecting each bearing with a hooked end of the wire inwardly of said offset central portion.

---

2,772,908



## VEHICLE DOOR LATCH

Burnie J. Craig, Pasadena, Calif.

Original application December 18, 1950, Serial No. 201,283, now Patent No. 2,705,884, dated April 12, 1955. Divided and this application March 7, 1955, Serial No. 492,611

3 Claims. (Cl. 292—280)

1. In a door lock, a base having a flange arranged at right angles thereto, a bolt pivoted on the base to rotate about an axis perpendicular to the base, a ratchet coaxial with the bolt pivot, bolt holding and releasing means engaging the ratchet for holding the bolt in engagement with a strike, a movably mounted release member, an actuating member, pivotal means supporting the actuating member on the release member, the actuating member being movable in a path to and from a locked position, the actuating member also being movable with the release member in a bolt releasing path, said holding and releasing means having an arm which has a tongue extending therefrom, said actuating member having a shoulder thereon, said tongue being normally disposed out of the path of the shoulder on the actuating member when the actuating member is in its locked position, said tongue being disposed in the path of said actuating member shoulder when the actuating member is in unlocked position for movement by the release member to bolt releasing position, means for moving the release member to bolt releasing position, a locking arm, means pivotally supporting the locking arm on the flange, means to hold the locking arm in either locking or in unlocking position, means including a shiftable member which has an upper finger engaging portion accessible from within the vehicle for moving the locking arm from locked to unlocked position and vice versa, the actuating member having a tongue at its free end, said tongue fitting in a

slot on the locking arm for moving the locking arm to and from locked position, said actuating member being effective to free the bolt holding and releasing means when it is moved while the locking arm is in unlocked position and said actuating member being ineffective to release the bolt holding and releasing means when it is moved while the locking arm is in unlocked position, said holding and releasing means including an ear directed towards said flange, an arm pivoted on said flange, the axis of said last mentioned arm being perpendicular to the flange, said arm including a portion engaging said ear, remote control means within the vehicle for rocking the last mentioned arm to move the holding and releasing means to bolt releasing position, said actuating member including a shoulder facing towards the ratchet and engageable with a portion of the holding and releasing means which faces away from the ratchet when the actuating member is in non-bolt releasing position and operable when the bolt is turned by engagement with a strike to restore the actuating member to unlocked position, said shoulder being disposed so that it is out of the path of the holding and releasing means portion which faces away from the ratchet and is inoperable when the actuating member is in locked position and is held in bolt releasing position, when the bolt is turned by engagement with a strike to move the actuating member to unlocked position.

---

2,772,909

## BAG SEAL

Sigurd M. Mobert, Pompton Plains, N. J., assignor to E. J. Brooks Company, Newark, N. J., a corporation of New Jersey

Application December 21, 1954, Serial No. 476,634

3 Claims. (Cl. 292—308)

1. A sealing device for application to the mouth of a bag of flexible material for closing the same, comprising a deformable seal member having a pair of approximately parallel bores extending therethrough, an elongate, flexible shackle member, opposite end portions of which are extensible through said bores and an intermediate portion of which constitutes a loop which is extensible about the neck of a bag to which the device is applied, and a stiff guard member of thin sheet material between said seal member and said loop; said seal member having an arcuate, deformable arch, in contact with said guard member and extending from an outer side wall portion of one of said bores to an opposite outer side wall portion of the other of said bores, and said guard member having a substantially flat wall, in contact with said arch, with an elongate aperture therein through which said shackle member extends, said flat wall being approximately perpendicular to said bores and said aperture in the guard member being of a length less than the

distance between said opposite outer side wall portions of said bores at said arch and of a width less than the thickness of said arch; said shackle member being adapted to be tensioned tightly about such a bag neck, said seal member being adapted to be deformed to tightly grip portions of the shackle member extending through said bores, and the deformability of said arch of the seal member being such that, upon such tensioning of the shackle member and such deformation of the seal member, portions of said flat wall, defining opposite sides of said elongate aperture, become embedded in opposite side portions of said arch, causing an intermediate portion of the arch to protrude into said elongate aperture, and edges of the material of the guard member which define opposite ends of said elongate aperture being adapted to tightly pinch adjacent parts of the shackle member's end portions between said opposite end edges and said protruding portion of the arch.

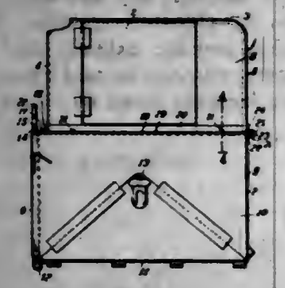
2,772,910

## AUXILIARY CONTROL HANDLE FOR SHOVELS

Orville K. Doyle, Fullerton, Calif.

Application May 4, 1953, Serial No. 352,839

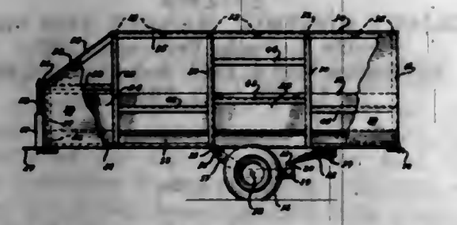
4 Claims. (Cl. 294—58)



4. An auxiliary handle for use with a spade or the like, comprising an arm having provisions at one end for universal type connection to the handle of a spade, said arm being movable to a position in which it extends along the length of said spade handle, said arm having at its other end a pair of spaced substantially parallel laterally extending portions adapted to extend respectively on opposite sides of said spade handle, a plane including said laterally extending portions being inclined to a line ex-

tending between said other end of said arm and said provisions, and a grip secured to one of said laterally extending portions, said grip having a recess in which said spade handle may be seated.

---



**2,772,911**
**ENCLOSED CONTAINERS**
**John Saylor Dempster, Knoxville, Tenn., assignor to Dempster Brothers, Inc., Knoxville, Tenn., a corporation of Tennessee**
**Application July 28, 1952, Serial No. 301,310**
**4 Claims. (Cl. 294—69)**

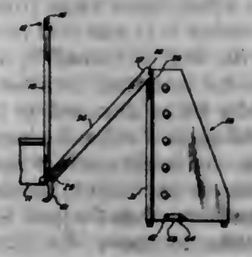
1. An enclosed container comprising top and bottom sections, each having surrounding side walls with enclosed top and bottom portions thereon, respectively, the front and end walls of the bottom section having inturned flanges thereon forming rims along the upper edges of said side walls, a bail connected with the bottom section of the container at the front thereof and extending therefrom for lifting and supporting the container, an angle bar fixed rigidly to the upper edge of the rear side wall of the bottom section with an outturned flange thereon, angle bars secured rigidly to the lower edges of the side walls of the top section and having outturned flanges seated upon the flanges on the bottom section, detachable fasteners extending through said flanges and detachably connecting the sections together for removal of the top section and permitting inversion thereof into nested relation within the bottom section, said bottom section including a drop bottom door hinged thereto and having means thereon for detachable engagement by a lifting vehicle.

---

**2,772,912**
**COMBINATION BOAT CARRYING AND HOUSE TRAILER**
**Robert F. Neff, Phoenix, Ariz.**
**Application August 23, 1954, Serial No. 451,498**
**4 Claims. (Cl. 296—23)**

1. In a trailer having a main frame, a vertically movable bed, road wheels on said frame, and power means to vertically reciprocate said bed, a pair of horizontally disposed side rails on said frame, wheel carrying arms pivotally and resiliently mounted on said side rails having means to rotatably mount said road contacting wheels within the sidewise confines of said side rails, upstanding hollow wall frames on said side rails, a roof carried on said wall frames, outside wall panels secured to the outside faces of said wall frames, a floor in said bed, side walls rigidly secured to said bed closely fitting between the inside faces of said wall frames of said main frame so as to form a closure for the spaces in said hollow wall frames when said bed is in raised position, end cross members fixed transversely under the bottom of said bed, lug pieces on said side rails, and locking pins adapted to secure said cross members to said side rails to support said bed in raised position and restrain said side rails against relative horizontal transverse movement.

---

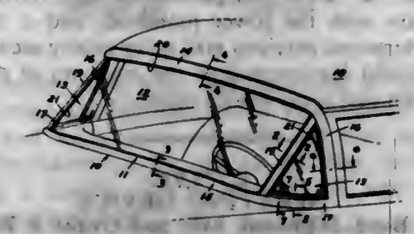


**2,772,913**
**SIDE STRUCTURES OF UTILITY TRUCK BODIES**
**James Howard Holan, Rocky River, and Herman J. Troche, Fairview Park, Ohio, assignors to J. H. Holan Corporation, Cleveland, Ohio, a corporation of Ohio**
**Application September 3, 1953, Serial No. 378,361**
**6 Claims. (Cl. 296—28)**

1. A truck body upper side structure comprising a panel formed at its upper end to buttress a body roof, said panel forming a rub rail and having a lower end inwardly-extended flange forming a drip molding, a second and substantially horizontal panel formed with an inner end downwardly-extended flange, the outer end of said second panel abutting the inside face of the first panel and serving as a brace for the first panel, and a body door having spaced longitudinal exterior and interior panel members, the door having an upwardly-extended exterior peripheral flange, the inner door panel having a peripheral flange sloping downwardly and outwardly and formed with an upwardly-extending terminal portion secured to the upwardly-extended peripheral door flange, the downwardly-extended flange of the brace panel having sealing engagement with said upwardly-extended exterior peripheral door flange inwardly of the drip molding, and the brace panel being formed with an inwardly-extending substantially horizontal door jamb part having a water block disposed within the vertical longitudinal planes defining said downwardly and outwardly-sloping inner door panel flange, whence water dripping from the water block falls freely and drains longitudinally along said inner door panel flange.

---

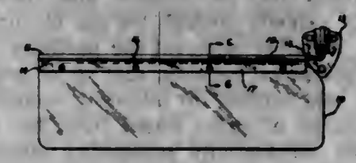
**2,772,914**
**DETACHABLE END GATE APPARATUS**
**Elmer K. Hansen, Sioux City, Iowa**
**Application May 27, 1955, Serial No. 511,631**
**1 Claim. (Cl. 296—53)**



End gate apparatus for a wagon having an upright frame at one end thereof, said apparatus including an end gate structure movable to a first position supported in a back-to-back relation with said frame and to a second position supported on the ground, means for movably supporting said end gate structure for movement between said two positions therefor comprising a pair of link members, means pivotally connecting the upper ends of said link members to transversely spaced upper portions of said gate structure, other means for pivotally connecting the lower ends of said link members to

transversely spaced lower portions of said upright frame, with one of said connecting means being releasable to provide for the removal of said end gate structure from said frame, when said end gate structure is in said second position therefor, and means for releasably holding said end gate structure in said first moved position therefor.

---

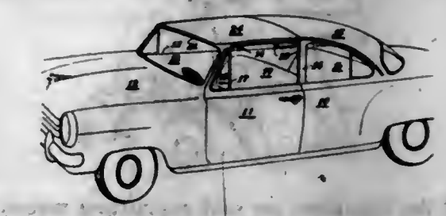


**2,772,915**
**WINDOW ASSEMBLY FOR VEHICLE BODIES**
**Donald G. Renno, Birmingham, Mich., assignor to Motor Products Corporation, Detroit, Mich., a corporation of New York**
**Application June 1, 1954, Serial No. 433,421**
**10 Claims. (Cl. 296—84)**

1. A vehicle body window assembly comprising a frame defining a window opening and having a member extending along the bottom of the opening and a member extending along each side of the opening, a ventilator panel supported within the opening for swinging movement about an upwardly inclined axis, a weatherstrip having a first part extending around the bottom frame member and one of said side frame members at the outer side of the frame to provide a weatherseal between the latter frame members and adjacent body structure, and a second part extending along the bottom frame member and said one of said side frame members at the inner side of the frame, a second weatherstrip coextensive with the second part aforesaid of the first weatherstrip and having portions engageable with the adjacent edges of the ventilator panel in the closed position of the latter to provide a weatherseal, and an interlocking connection between the second weatherstrip and the second part aforesaid of the first weatherstrip.

---

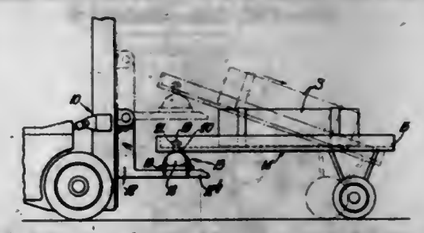
**2,772,916**
**VISOR FOR VEHICLES**
**William R. Jones, Cleveland, Ohio, assignor of one-half to George F. Metzger, Cleveland, Ohio**
**Application August 16, 1954, Serial No. 450,099**
**5 Claims. (Cl. 296—97)**



5. A sun shield for an automobile comprising a plate, a round rod for the support thereof, a channel enveloping said rod and mounted on said plate in straddled relation therewith and spring metal strips intermediate said plate and the flanged portions of said channel the upper edges of said strips being disposed in impinged relation with a portion of the side wall of said rod.

---

**2,772,917**
**CONVERTIBLE HARD TOP AUTOMOBILE BODY**
**Ida Goldman, Youngstown, Ohio**
**Application December 28, 1953, Serial No. 400,720**
**1 Claim. (Cl. 296—137)**



An automobile body having a fixed top portion, a fixed windshield portion and doors spacing said fixed portions longitudinally of said body, a frame defining said fixed windshield portion and having panel receiving formations on its upper inner edge, a hard top portion movably positioned in said fixed top portion for movement outwardly therefrom and inwardly thereinunder,

said fixed top portion having vertically spaced parallel guide rails on either side thereof for receiving and guiding said hard top portion, the lower rails being provided with rollers on their foremost ends and said ends comprising spring members normally urging said hard top portion upwardly.

---

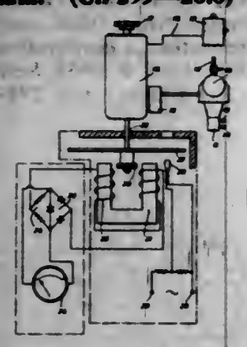
**2,772,918**
**DUMPING TRACTOR-TRAILER VEHICLE**
**William B. Klinger, Niles, Ohio, assignor to United States Steel Corporation, a corporation of New Jersey**
**Application April 9, 1953, Serial No. 347,772**
**1 Claim. (Cl. 298—5)**

In combination, a truck which includes a vertically movable fork at its front end, said fork having a pair of horizontally spaced apart tines, a trailer which includes a floor and a pair of wheels adjacent the front end of said floor, the front end of said floor being unobstructed to permit a load to be dumped therefrom when the back end is lifted, and a device attaching said trailer to said truck, said device comprising a base plate bridging the space between said tines and being removably fastened to said tines, a hemispherical bearing affixed to the top of said base plate and having an upwardly curved spherical surface, a screw threaded vertically extending stud upstanding from the spherical surface of said bearing, said floor having an opening adjacent its back end loosely receiving said stud, and a fastener screw-threadedly engaged with said stud above said floor, the underside of said floor resting on the spherical surface of said bearing irrespective of the vertical position of said fork or the inclination of said floor to provide a positive support for the back end of the floor and for lifting it for dumping.

---

**2,772,919**
**SUMP-TYPE CONTAINERS FOR TRANSPORTING AND DUMPING EQUIPMENT**
**Harry W. Jones, Knoxville, Tenn., assignor to Dempster Brothers, Inc., Knoxville, Tenn., a corporation of Tennessee**
**Application December 29, 1952, Serial No. 328,310**
**15 Claims. (Cl. 298—30)**

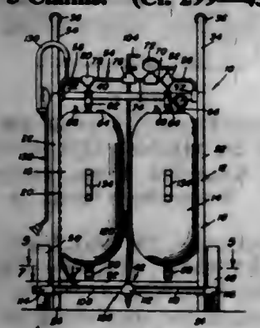
14. The combination with a vehicle, of a container, means on the vehicle for supporting the container in a position inclined toward the front of the vehicle, said container having a bottom hinged thereto substantially at the bottom of the front wall thereof, said bottom having a sump formed therein, and a wall extending upwardly from the door and outwardly away from the hinge



thereof forming a receptacle along said hinge edge open in the direction of the sump to receive liquid therefrom upon

tilting of the container on said supporting means toward the front of the vehicle.

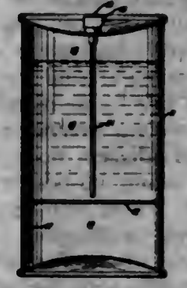
---



**2,772,920**
**HOT METAL SPRAY GUNS**
**William O. Lee, Stopsley, and Cledwyn Williams, Oakley, England, assignors to D. Napier & Son Limited, London, England, a British company**
**Application July 29, 1955, Serial No. 525,303**
**Claims priority, application Great Britain August 5, 1954**
**1 Claim. (Cl. 299—28.8)**

A hot metal spray gun comprising means for heating one end of a metal rod to a substantially molten state, means for supplying a blast of gas adjacent said end of the metal rod to project the molten metal in the form of spray, and means for feeding the metal rod progressively towards the heating means including a motor, at least one feed wheel bearing on the rod, and a reduction gear interposed between the motor and the wheel, and means for indicating the rate of feed of the metal rod comprising a dynamo-electric generator driven directly by the feed motor at the same speed and an electrical indicator device comprising an electric motor selected from the class including voltmeters and ammeters to which the output from the generator is led.

---



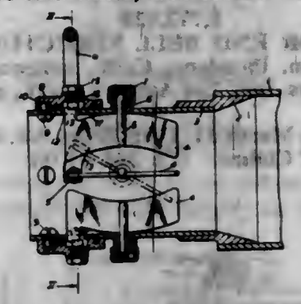
**2,772,921**
**GARDEN SPRAYING DEVICE**
**James R. Nance, Winchester, Ind.**
**Application December 5, 1955, Serial No. 551,032**
**5 Claims. (Cl. 299—43)**

1. A portable sprayer assembly comprising a hand-truck type wheeled frame, a first transverse manifold extending across a lower portion of said frame, first and second tank members supported in side-by-side relation on said frame, means detachably securing lower end portions of said tank members on said manifold and permitting communication between the first of said tanks and the manifold, a second transverse manifold removably supported across an upper portion of said frame, means detachably connecting upper end portions of the tank members to said second manifold and permitting communication therebetween, means on the first tank permitting said tank to be filled with a liquid to be sprayed, means on the second tank permitting said tank to be pressurized, first valve means interposed between the second tank and the second manifold for controlling pressure communication to said second manifold, said valve means interposed between the first tank and the first valve means controlling the pressure directed to said first tank, spray nozzle means supported on the lower end portion of said frame in communication with the lower manifold, and a third valve means interposed between said spray nozzle means and the first manifold for controlling the emission of pressurized liquid from said spray nozzle means.

---

**2,772,922**
**SPRAYING DEVICE**
**Loyd Q. Boyd, Highland, Ind., and Griffin J. Baker, Lansing, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana**
**Application January 31, 1955, Serial No. 485,260**
**1 Claim. (Cl. 299—95)**

A hand spraying device for spraying liquid by means of a liquefied propellant, which device comprises a vertical, closed container having top and bottom closures, a substantially horizontal partition for sealing the interior of the container into a relatively small lower chamber for liquefied propellant and a relatively large upper chamber for liquid to be sprayed, a capillary tube having an internal diameter of at least about 0.02 inch but less than 0.25 inch extending from a point adjacent the bottom of the lower chamber through said partition to a point adjacent the top of the upper chamber, a spray nozzle positioned above the top closure and connected to a conduit which extends through the top closure to a point in the upper chamber adjacent the partition and a valve mechanism interposed between said spray nozzle and the lower end of said conduit for initiating, stopping and controlling discharge of spray liquid from the nozzle, said capillary tube substantially preventing intermingling of liquefied propellant with liquid to be sprayed whereby a much smaller amount of liquefied propellant is required for spraying a given amount of liquid than is required when liquid to be sprayed and liquefied propellant are admixed.



---

**2,772,923**
**NOZZLE**
**Thomas Anthony Henshaw, Kew Gardens, and Cecil Kennerson, Hounslow, England, assignors to The Pyrene Company Limited, Brentford, England, a British company**
**Application October 27, 1953, Serial No. 388,476**
**Claims priority, application Great Britain November 3, 1952**
**3 Claims. (Cl. 299—117)**

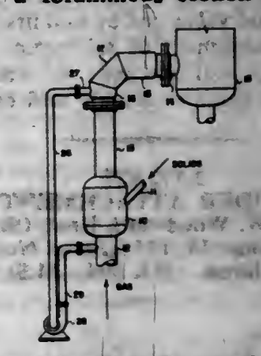
1. A nozzle comprising a tube open at both ends, a plurality of vanes extending longitudinally within said

tube, means located at the center of said vanes pivotally mounting said vanes to said tube, said means lying in a common plane perpendicular to the axis of said tube, and supplying substantially radial axes for turning movement of said vanes, and means for turning said vanes by actuating one end of said vanes, said second means comprising

a ring encircling said tube and mounted to turn on it without moving axially, mechanical connections between said ring and said vanes, whereby all said vanes are adjusted simultaneously by turning the ring, and further comprising a handle rigidly attached to said ring by which the nozzle is held in use.

---

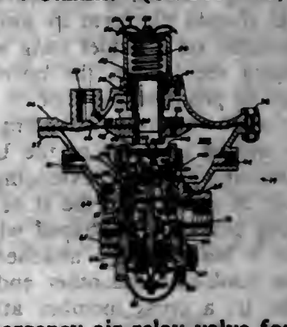
**2,772,924**
**WHEEL COVER**
**Stanford Landell, Fayetteville, N. Y., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware**
**Application August 24, 1953, Serial No. 376,097**
**1 Claim. (Cl. 301—37)**



A wheel cover structure for a vehicle wheel having a multi-flanged tire rim, said cover structure comprising a concave-convex outer portion having a rearwardly inturned outer marginal portion, a radially inclined annular flange, an axially rearwardly directed continuous flange integral with said inclined flange, said axially directed flange being provided intermediate thereof at spaced intervals with integral V-shaped struck-out portions having their pointed ends directed radially outwardly and axially forwardly from the surface thereof, said V-shaped portions being connected to said axially directed flange at their axially rearwardmost extremity and being adapted to flex inwardly when said cover is forced axially inwardly on said wheel and to bitingly engage a portion of said rim parallel with said axially directed flange to prevent axial outward movement of said cover, and a peripheral inturned bead on said axially directed flange providing a pilot perimeter for initially locating said cover on said wheel.

---

**2,772,925**
**PROTECTING WALLS AGAINST EROSION BY SOLID PARTICLES**
**Justin C. Dygert, Walnut Creek, Calif., assignor to Shell Development Company, New York, N. Y., a corporation of Delaware**
**Application September 20, 1955, Serial No. 535,381**
**5 Claims. (Cl. 302—64)**



1. In apparatus wherein a suspension of erosive solid particles in a fluid move with the gross flow of said fluid generally parallel to the bounding surface of a wall, the improvement of a structure for resisting erosion of said wall including a foraminous section in said wall and

means for maintaining the other surface of the wall at a pressure lower than that of the fluid suspension to form and maintain on said bounding surface a protective layer of said solid particles.

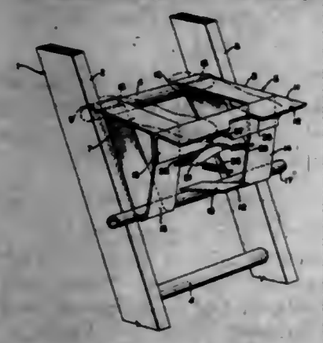
**2,772,926**
**EMERGENCY AIR RELAY VALVE**
**Rollin W. Fishwood, Vancouver, Wash., and Norman C. Williams, Portland, Oreg., assignors to Power Brake Equipment Company, Portland, Oreg., a corporation of Oregon**
**Application August 16, 1954, Serial No. 449,831**
**4 Claims. (Cl. 303—63)**



1. In an emergency air relay valve for a trailer brake actuator of an automotive truck-trailer combination vehicle: a hollow guide member of generally cylindrical shape open at one end, a first barrier formed in said guide adapted to divide the interior thereof into a first space and a second space, said first barrier having a central first air port formed therethrough; a valve stem guided for axial movement with air conducting clearance through said first air port, means carried on said stem to close said first air port at one position of said stem; a first opening formed through the wall of said guide member adapted to connect said first space with a source of air; a second opening formed through the wall of said guide adapted to connect said second air space with an air storage means; a hollow generally cylindrical valve box open at one end slidably guided in said guide member for axial movement therealong, the open end of said box being open to said second space, a second barrier formed in said box adapted to form therein a third space separated from said second space, a hole formed in the wall of said box adapted to connect said third space with said air actuating means for a trailer brake, a brake inlet air port formed centrally through said second barrier, an inlet valve seat formed around said inlet air port, an inlet valve carried on said stem, said inlet valve and said inlet valve seat when closed one on the other being adapted to close said inlet air port; a first biasing means adapted to bias said valve box toward the closed position of said inlet valve seat on said inlet valve; a second biasing means adapted to bias said valve stem towards the open position of said inlet valve on said inlet valve seat; opposing means adapted variably to oppose both said biasing means to control the movement of said valve stem in response

to a condition; and means adapted, when both said biasing means overcome said opposing means and move said stem to close said first air port in said first barrier, to limit the movement of said valve box by said first biasing means whereby further movement of said stem will raise said inlet valve from its seat and pass air from said second space to said third space to actuate said brake.

**2,772,927**
**LADDER ATTACHMENT**
**Alva W. Woodward, Kent, Ohio**
**Application June 14, 1954, Serial No. 436,422**
**2 Claims. (Cl. 304—31.5)**

1. A step for use with a ladder having a pair of side rails and spaced rungs extending therebetween comprising a generally U shaped platform to support a person thereon when mounted on a ladder rung with the opening of the U facing the ladder, the opening providing space for a person to position one foot on the rung free of the platform; a downwardly extending rung engaging hook on the end of each leg of the U at the open end; a pair of mounting members extending downwardly from the underside of each leg of the U of the platform, each member being generally V shaped with one of the open ends of the V being rigidly attached to the platform adjacent the hook and the other end adjacent the closed end of the U; a cross member attached to the mounting members adjacent the closed end of the V and adapted to engage the side rails of the ladder to hold the platform in position with respect to the ladder; and a saddle member resiliently attached to the mounting members and spaced from the cross member to releasably engage the upper portion of a foot when inserted between said cross member and said saddle member to permit the worker to move the platform up or down the ladder with his foot.

**2,772,928**
**BEARINGS OR BUSHINGS**
**Hans Traugott Schulz, Nurnberg, and Friedrich Rittmann, Ruckersdorf, Mittelfranken, Germany, assignors to C. Conradty, Nurnberg, Germany**
**Application February 25, 1953, Serial No. 338,814**
**Claims priority, application Germany March 21, 1952**
**1 Claim. (Cl. 308—36.1)**

A bearing which is self-contained, self-lubricating and self-packing comprising a cylindrical body of carbon having at each end at least one groove arranged circumferentially in the internal surface of the body and a ring of felt provided in each of said grooves so that said rings are deformable to form secure packings, said rings being impregnated with hard wax so that each felt ring will be bonded to adjacent parts of the respective groove to thereby form a self-contained bearing structure, said rings projecting a slight distance inwardly beyond the internal peripheral surface of the body of carbon.

---

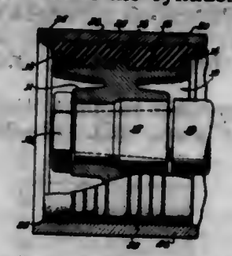
**2,772,929**
**MOTOR END BELL STRUCTURE**
**John R. Eastman, Pasadena, Calif., assignor to Sterling Electric Motors, Inc., Los Angeles, Calif., a corporation of California**
**Application March 31, 1955, Serial No. 498,312**
**7 Claims. (Cl. 308—236)**

1. In a structure of the character described, the combination of: an end bell for an electric motor, said end bell having an internal bearing recess therein; a bearing in said recess; pivotable means in said end bell adjacent said recess and pivotable over the inner side of said bearing; and means extending through said end bell and operable from the exterior thereof for pivoting said pivotable means over the inner side of said bearing.

---

**2,772,930**
**BEARINGS**
**Otto Schubert, Sr., and Otto Schubert, Jr., Erlangen, Germany**
**Application July 23, 1952, Serial No. 300,382**
**Claims priority, application Germany March 21, 1952**
**10 Claims. (Cl. 308—238)**

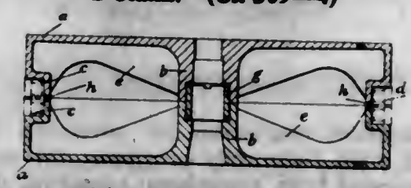
1. Bearing comprising in combination a metallic backing and a sliding surface layer consisting of a thin layer of hard, polymerized, synthetic resinous composition applied to the metallic surface of the backing, and hardened by heat under atmospheric pressure, comprising a thermosetting resin which undergoes shrinkage during polymerization and a comminuted filler having a stronger adhesion to the resinous binder than the inner adhesion forces of said filler, said layer containing a plurality of not oriented capillary passages, at least some of which discharge to the surface of said layer and at least some of which are connected with each other, said layer being capable of taking up lubricant and discharging it during movement of the sliding surfaces.



---

**2,772,931**
**PISTON FOR RECIPROCATING PUMPS**
**Paul R. G. Biedermann, Los Angeles, Calif.**
**Application November 6, 1953, Serial No. 390,480**
**8 Claims. (Cl. 309—4)**

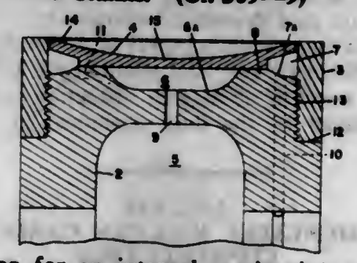
1. A piston construction for use in a cylinder of a reciprocating pump or the like that comprises: a centrally located metal body adapted to be attached to a piston rod for reciprocation within a cylinder; and an annular sealing ring of rubber-like material surrounding and mounted upon the metal body, said ring having a normal diameter in excess of the cylinder diameter when free of externally



applied compressive forces so that when in place on the body and confined within the cylinder the ring is under

radial compression at all positions and has internal strains tending to expand the ring radially to its normal diameter.

---

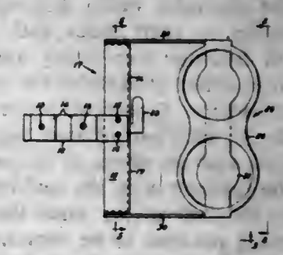


**2,772,932**
**PISTONS**
**Henry Edward Muckley, Barnt Green, England, assignor to Bellis & Morcom Limited, Birmingham, England**
**Application March 11, 1955, Serial No. 493,729**
**Claims priority, application Great Britain April 6, 1954**
**1 Claim. (Cl. 309—4)**

A piston comprising a pair of coaxially arranged similar halves provided with central hollow bosses which at their adjacent ends are in contact with each other, and are internally enlarged and screw threaded, and a complementary screw threaded bush interconnecting the screw-threaded ends of the bosses, the adjacent ends of the outer peripheral portions of the two halves being stepped to provide jointly a circumferential groove around the piston, and the contiguous edges of the steps being united by a metallic bonding agent.

---

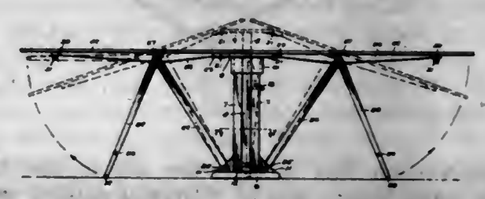
**2,772,933**
**PISTONS**
**William M. Nichols, Schenectady, N. Y., assignor to Alco Products, Incorporated, New York, N. Y., a corporation of New York**
**Application June 22, 1955, Serial No. 517,331**
**5 Claims. (Cl. 309—9)**



1. A piston for an internal combustion engine comprising a main body having a reduced portion, a ring carrier secured to the reduced portion, a preloaded disk seated upon the top of the piston body and welded to the ring carrier to form a crown for the piston, the arrangement of the parts being such that the disk is under a permanent state of tension thereby increasing the capacity of the crown to withstand the pressures of comustion.

---

**2,772,934**
**FOOD SERVICE TRAY**
**Harold K. Eraut, Portland, Oreg.**
**Application August 1, 1955, Serial No. 525,588**
**1 Claim. (Cl. 311—21)**

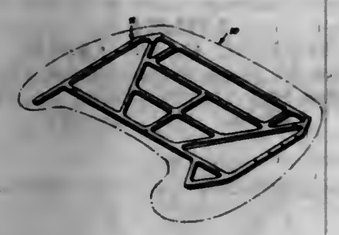


In a food service tray combination which includes a stationary hinge bracket, a tray, means for securing said bracket to a support, hinging means hingedly securing said tray to said bracket, latching means cooperatively formed on said bracket and said support for latching said tray in a service position with respect to said bracket and unlatching means carried on said bracket manually operable to release said tray for rotation about the hinging axis of said hinging means to a storage position: the combination of a pair of laterally spaced opposite end faces formed on said bracket, a pair of laterally spaced opposite end faces formed on said tray to mate respectively with the adjacent end faces on said bracket, one of said pair of laterally spaced opposite end faces being formed with a pair of coaxial bearing holes therethrough, a pair of coaxial journals secured respectively to the other of said

pair of opposite end faces to extend oppositely through said bearing holes hingedly to support said tray on said bracket, means resiliently supporting one of said opposite end faces at one end of said bracket and said tray for lateral movement with respect to the other of said end faces, latch means cooperatively formed on said resiliently supported one of one of said pair of said opposite end faces and the adjacent one of the other of said pair of said opposite end faces to latch said tray in a service position with respect to said bracket and lever means pivotally carried on said bracket manually operable to displace said resiliently supporting means to separate said faces on which said latch means are cooperatively formed to release said tray for rotation to a storage position.

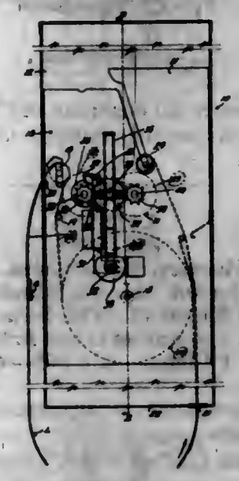
---

**2,772,935**
**FOLDING GAME TABLE**
**Clyde M. Read, Miami Shores, Fla.**
**Application May 11, 1955, Serial No. 507,541**
**1 Claim. (Cl. 311—89)**



A folding table that includes a rectangular pedestal having base members at opposite ends, each base member rigidly supporting a pair of spaced apart square bars that are parallel and vertically arranged and with the pairs of bars at the opposite ends of the pedestal being parallel, square plunger bars slidable in a vertical plane between the pairs of bars, cross frame members at the upper and lower ends of the pedestal whereby to rigidly connect the pairs of bars, a rectangular panel member that is rigidly connected to the upper ends of the plunger bars along its longitudinal center line, a pair of relatively large leaf members that are hingedly connected to the opposite longitudinal edges of the panel, each of the leaf members being co-extensive in length and width, transverse strips fixed to the under side of the leaf members inwardly of their inner ends and with the strips constituting the point of connection for the hinge, the leaf members being swingable in a vertical plane from a horizontal table forming position to a folded position, the said leaf members when in table forming position having their inner ends in overlying and parallel relation to the panel whereby their

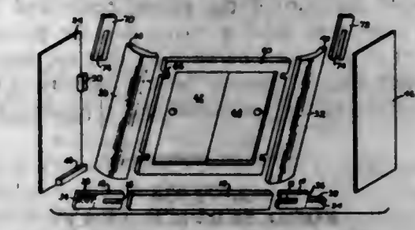
inner ends terminate along the longitudinal center line of the panel, a pair of fulcrum bars disposed at opposite sides of the pedestal and with their lower ends being pivotally connected at each base member and their upper ends being pivotally connected with the under side of the leaf members intermediate and adjacent each side of the leaf members, the said leaf members swingable downwardly from their outer ends upon the fulcrum bars whereby to cause their inner ends to be elevated for elevating the said panel and its associated plunger bars through the medium of the hinge connection, the elevating of the panel and the plunger bars transmitting a similar movement to the opposite leaf member upon its associated fulcrum bars, the leaf members when in the fully folded position of the table being disposed in a vertical plane to be parallel to each other and parallel to the pedestal, the said fulcrum bars being angled outwardly from the pedestal in either position of the table and underlying the leaf members, a pair of brace legs for each leaf member and with each pair of brace legs being pivotally connected to the leaf members at the points of pivotal connection for the fulcrum bars, the said legs being swingable downwardly on their pivots when the leaf members are in table forming position to be outwardly angled and in floor engagement for bracing the leaf members against fulcrumed movement upon the fulcrum bars, the said legs adapted to be swung to nested position beneath the leaf members when the leaf members are to be shifted to a folded position and cable means carried by the pedestal and connected with each plunger bar whereby to mechanically shift the leaf members to and from a table forming position.



---

**2,772,936**
**DESK OR TABLE TOP SUPPORT FRAME**
**William James Bargen, Waukegan, Ill.**
**Application April 21, 1955, Serial No. 502,900**
**1 Claim. (Cl. 311—105)**

A combination desk or table top and support frame therefor comprising a pair of elongated parallel spaced apart side members, a pair of parallel elongated cross members extending between and joined to said side members forming a substantially rectangular configuration, said side members each extending a substantial distance beyond one of said cross members, a pair of bracing members extending from the opposite junctures of said side members with the other of said cross members at a converging angle to each other terminating at spaced apart medial points on said one cross member, said bracing members being integrally joined to said cross members and said side members, a pair of cross brace members parallel to and equispaced from said cross members extending between and joined integrally to said brace members, a central member integrally joined to the medial points of said cross brace members and said one cross member, said members each having an inverted U-shaped cross section, means on each of said members for securing said frame to a support, a top panel extending over said frame, and means bonding said frame to said top whereby the combined strength of said frame of said top is materially increased.



**2,772,937**
**ESCAPEMENT MECHANISM FOR WEB-DISPENSING APPARATUS**
**Leslie R. Tansley, Columbus, Ohio, assignor to White Castle System, Inc., Columbus, Ohio, a corporation of Delaware**
**Application September 16, 1954, Serial No. 456,382**
**4 Claims. (Cl. 312—38)**

1. Escapement mechanism for governing the withdrawal of webs from rolls containing the same in a spirally wrapped form, comprising: supporting means for such a web-containing roll; an escapement-operating roller carried by the supporting means in spaced relation to the web roll, said roller being rotated by the passage of a web withdrawn from said roll into contacting engagement with the periphery of said roller; a shouldered element mounted for rotation in unison with said roller; a movable stop member carried by said supporting means in coacting relation with said shouldered element; a permanent magnet having spaced poles mounted rigidly on said stop member; a magnet-attracting body normally disposed in the pole field of said magnet; a fluid-containing carrier means in which said body is movably mounted; a pivotal support for said carrier means; and means responsive to roller rotation to impart turning movement to said carrier means, whereby to provide a timed cycle of movement for said body in which the carrier means is positioned so that the body is removed from the field of said magnet to cause the stop member associated therewith to engage said shouldered element and to stop roller rotation following the withdrawal of a determinate length of the web from its roll, and wherein the return of said body to its position of magnet attraction and roller release is delayed by the fluid contained in said carrier means.

**2,772,939**
**MANUFACTURE OF TRAVELING WAVE TUBES**
**Joseph P. Laico, Springfield, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York**
**Application October 21, 1953, Serial No. 387,362**
**2 Claims. (Cl. 316—18)**

1. In the manufacture of traveling wave tubes, the process for obtaining a controlled collapse of an elongated glass envelope portion onto helix support rods comprising the steps of slidably inserting helix support rods to which a helix has been attached into an elongated glass envelope, evacuating said envelope, passing a current through said helix sufficient to heat said helix and said envelope but insufficient of itself to soften the glass enough to cause atmospheric pressure to collapse the glass onto the helix support rods, reflecting the heat from said helix back upon said envelope adjacent the portions thereof to be collapsed to provide the additional temperature rise sufficient to soften the glass for collapse thereof, and discontinuing the collapse of said glass after said glass has collapsed onto said helix support rods and before said glass is contiguous to said helix.

**2,772,940**
**AUTOMATIC RECORDING DEVICE FOR MANEUVERING SHIPS**
**Richard Golze, Staten Island, N. Y.**
**Application October 28, 1953, Serial No. 388,759**
**1 Claim. (Cl. 346—8)**

In automatic recording apparatus for maneuvering ships, a housing, a chart therein, a transverse guide bar supported in the housing, a bar dependent from and slidable along said guide bar, said slidable bar having a bifurcated end with openings in its bifurcations, means for sliding said dependent bar, and a stylus recording device carried by said slidable bar, said device consisting of a tubular ink reservoir closed at one end and open at the other end, a tubular holder for said reservoir, a plate extension on said holder, a hook on the end of said plate extension, a plate hingedly connecting the plate extension and the bifurcated end of the sliding bar, said connecting plate having opposed perforated ears at one end disposed in alignment with the bifurcations on the end of the sliding bar, the upper end of the plate extension being hooked over the upper end of said connecting plate between said perforated ears, spring clips on the other end of the connecting plate encircling said extension plate, a shaft extending through the aligned openings and perforations in the bifurcations and perforated ears, respectively, a goose-neck tubular scribing element supported in the tubular ink reservoir and extending outwardly through the open end thereof, and a spring coil on the shaft normally urging the tubular holder so that the scribing element engages the chart in operative position.

---

**2,772,941**
**HIGH SPEED SEQUENCE CAMERA**
**Charles A. Hulcher, Hampton, Va.**
**Application May 19, 1952, Serial No. 288,637**
**3 Claims. (Cl. 346—107)**

1. In a sequence camera comprising a casing, strip film feeding and film take-up means within said casing operated at constant speed, a film gate through which said film passes and means intermittently engaging said film for effecting intermittent pull down of said film through said film gate and with a period of dwell between successive pull downs, the improvement which resides in means for establishing timing marks on said film, said means including a light source providing light pulses at a predetermined repetition rate and means actuated in timed relation with said film pull down means for sweeping the light pulses emitted from said light source longitudinally back and forth along said strip film at said film gate, the sweep of said light pulses during the dwell period between successive pull downs being in the direction opposite to that traveled by the film and in the same direction as that traveled by the film during the pull down.

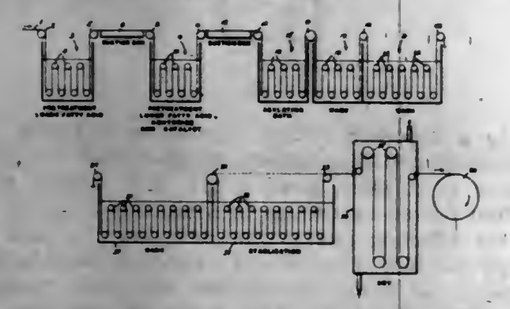
**2,772,942**
**PHOTOLITHOGRAPHIC PRINTING ART**
**Mark A. Mattaro, Aldie, Va.**
**Application June 8, 1951, Serial No. 230,560**
**5 Claims. (Cl. 41—46)**

1. A method of making an addition to a master negative from which a lithographic printing plate is to be produced, said method comprising providing a transparent master negative plate with indicia thereon and which indicia requires changes, ink printing a positive legend of said changes on a transparent strip, exposing the positive printed transparent strip to a sensitized plate to obtain a printing plate, pulling an ink impression in negative form on transparent material from the printing plate, forming a transparent area in the master negative plate at the position requiring said changes, and securing the transparent material carrying the pulled negative impression in the transparent area of the master negative plate.



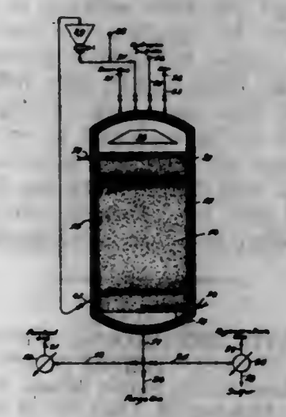
# CHEMICAL

**2,772,943**
**PROCESS OF DYEING WOOL-POLYACRYLONITRILE BLEND**
**Lejaren Arthur Hiller, Jr., Waynesboro, Va., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware**
**No Drawing. Application August 28, 1952, Serial No. 306,936**
**1 Claim. (Cl. 8—21)**

A process for selectively dyeing a fibrous acrylonitrile polymer, containing at least 40% acrylonitrile by weight, in a blend with wool which comprises subjecting the blend to the action of an aqueous dye bath containing a basic cyanine dye and having a pH between about 3.0 and about 5.0, removing any dye from the wool and then subjecting the resultant blend to the action of an aqueous dye bath containing an acid dye.

---

**2,772,944**
**PROCESS FOR THE ACETYLATION OF REGENERATED CELLULOSE FIBERS AND PRODUCT RESULTING THEREFROM**
**Arthur L. Allewelt, West Chester, Pa., assignor to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware**
**Application March 27, 1953, Serial No. 345,140**
**3 Claims. (Cl. 8—121)**



1. A process for the acetylation of regenerated cellulose fibers with retention of their fibrous structure comprising successively impregnating regenerated cellulose fibers in their swollen, wet gel state and containing between 35% and 60% by weight of water with (1) glacial acetic acid and (2) a mixture containing between about 2% and 10% by weight of acetic anhydride, a small amount by weight of an acetylation catalyst and the balance glacial acetic acid, said successive impregnations effecting the substitution of acetic acid for substantially all of the water contained by the wet gel fibers while maintaining the fibers in a swollen state, removing the excess acetic acid solution to provide the fibers with an acetic acid content between 35% and 60% by weight, then immersing the swollen fibers for from 15 seconds to 150 seconds in an acetylating bath maintained at a temperature between 35° C. and 60° C., said bath comprising by weight, between 5% and 25% acetic anhydride, between 0.05% and 0.1% of an acetylation catalyst and between 75% and 95% of an organic diluent for the acetic anhydride, the organic diluent being substantially inert to cellulose acetate, washing the acetylated fibers and finally drying the acetylated fibers.

3. As an article of manufacture, a regenerated cellulose fiber acetylated only at its surface and outer peripheral zone formed by successively impregnating a swollen wet gel regenerated cellulose fiber containing between 35% and 60% by weight of water with (1) glacial acetic acid and (2) a mixture containing between about 2% and 10% by weight of acetic anhydride, a small amount by weight of an acetylation catalyst and the balance glacial acetic acid, said successive impregnations effecting the substitution of acetic acid for substantially all of the water contained by the wet gel fibers while maintaining the fibers in a swollen state, removing the excess acetic acid solution to provide the fibers with an acetic acid content between 35% and 60% by weight and then immersing the swollen fibers in an acetylating bath maintained at a temperature between 35° C. and 65° C., said bath comprising, by weight, between 5% and 25% of acetic anhydride, between 0.05% and 0.1% of an acetylation catalyst and between 75% and 95% of an organic diluent for the acetic anhydride, the organic diluent being substantially inert to cellulose acetate, and washing and finally drying the acetylated fiber, said fiber having an acetyl content of between 6% and 22%, a dry tenacity of at least 2.5 grams per denier, a wet tenacity of 1.45 grams per denier and a wet and dry extensibility of at least 15%.

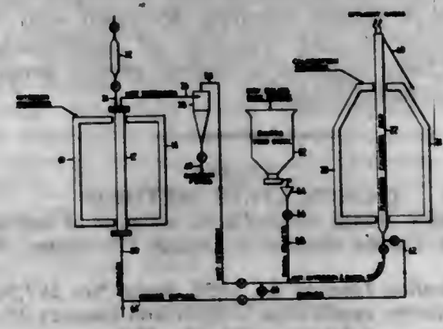
---

**2,772,945**
**REGENERATION OF HYDROGEN SULFIDE ABSORBENT AND MANUFACTURE OF SULFUR**
**Herbert N. Dunning, Bartlesville, Okla., and Arthur P. Lien, Highland, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana**
**Application November 27, 1953, Serial No. 394,804**
**10 Claims. (Cl. 23—3)**

8. A process which comprises contacting a gaseous stream containing hydrogen sulfide with a hydrogen sulfide absorbent consisting essentially of an intimate mixture of at least one alkali metal hydroxide selected from the class consisting of sodium hydroxide and potassium hydroxide with at least one member selected from the class consisting of alkaline earth metal oxides and hydroxides until said absorbent becomes at least partially spent; forming on a substantial portion of the surface of said spent absorbent, a thin layer of a combustion initiator consisting essentially of absorbent in its active state, at least a portion of said initiator consisting of regenerated absorbent; introducing concurrently a hydrogen sulfide-containing gas and an oxidizing gas therefor selected from the class consisting of air and sulfur dioxide into said combustion initiator layer in amounts at least about sufficient to cause a high temperature zone of about 1600 to 1800° F. to develop within said initiator layer; discontinuing the introduction of said hydrogen sulfide-containing gas; and continuing the introduction of said oxidizing gas through said initiator layer and said spent absorbent whereby said high-temperature zone traverses said spent absorbent and effects regeneration thereof.

**2,772,946**
**PREPARATION OF DOUBLE FLUORIDES OF TITANIUM AND AN ALKALI METAL**
**Quentin H. McKenna, Cleveland, Ohio, assignor, by mesne assignments, to Horizons Titanium Corporation, Princeton, N. J., a corporation of New Jersey**
**No Drawing. Application August 19, 1954, Serial No. 451,061**
**13 Claims. (Cl. 23—88)**

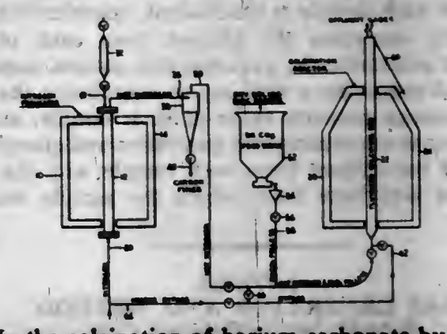
1. The method of producing alkali metal fluotitanates in which the titanium has a valence of at least two and not greater than three which comprises bringing titanium carbide into contact with an alkali metal fluotitanate in which the titanium has a valence of four and maintaining the reactants at an elevated temperature between about 800° C. and about 1100° C. whereby they react to produce a product containing at least one alkali metal fluotitanate in which the titanium has a valence of at least two and not greater than three.



---

**2,772,947**
**PROCESS FOR CONVERTING NICKEL SULFIDE TO NICKEL SULFATE**
**Elbert O. Sowerwine, Jr., Wapiti, Wyo., assignor to Wigton-Abbott Corporation, Plainfield, N. J., a corporation of New Jersey**
**No Drawing. Application March 23, 1951, Serial No. 217,310**
**2 Claims. (Cl. 23—117)**

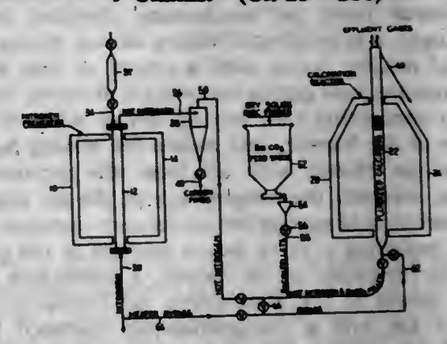
2. The process for converting nickel sulfide to nickel sulfate that comprises heating nickel sulfide at a moderately elevated temperature not in excess of about 400° C. in an atmosphere containing in excess of 80% sulfur dioxide and about 3 to 10% of oxygen, while maintaining a superatmospheric pressure.



---

**2,772,948**
**CALCINATION OF BARIUM CARBONATE**
**Henry W. Rahn and Charles J. Sindlinger, Corpus Christi, Tex., assignors to Columbia-Southern Chemical Corporation**
**Application June 10, 1955, Serial No. 514,562**
**11 Claims. (Cl. 23—186)**

1. A method of calcining barium carbonate which comprises heating a bed of porous barium carbonate granules comprising finely divided barium carbonate and carbon bonded together, the preponderant portion of said granules having a particle size of 4 to 80 mesh, at a temperature of 850 to 1025° C. while fluidizing said bed in an upwardly rising stream of nitrogen containing gas flowing at a rate of 1 to 7 feet per second while correlating the rate of calcination and the rate of nitrogen introduction so that the concentration of nitrogen in the evolved gas flowing from the bed is at least 70 percent by volume of said gas, maintaining the amount of carbon dioxide, $H_2O$, and elemental oxygen in the nitrogen supplied to the bed each below 0.5 percent by volume, and supplying the heat for the calcination through a wall while maintaining the fluidized bed in contact with said wall.



**2,772,949**
**CALCINATION OF BARIUM CARBONATE**
**Henry W. Rahn and Charles J. Sindlinger, Corpus Christi, Tex., assignors to Columbia-Southern Chemical Corporation**
**Application June 7, 1952, Serial No. 292,284**
**2 Claims. (Cl. 23—186)**

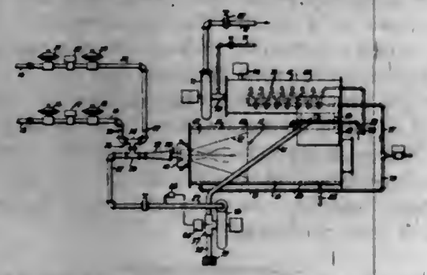
1. In the calcination of barium carbonate by establishing a fluidized bed comprising barium carbonate and carbon in an upwardly rising stream of inert gas, said bed being disposed in a reactor having a metal wall, while heating the bed by transfer of heat into the reactor from a point exteriorly thereof through said metal wall, the improvement which comprises heating said bed through a metal wall which is coated on the side in contact with the fluidized bed with an adherent coating of a member of the group consisting of barium oxide and mixtures of barium oxide and barium carbonate, said coating being less than ⅛ inch in thickness.

---

**2,772,950**
**CALCINATION OF BARIUM CARBONATE**
**Henry W. Rahn and Charles J. Sindlinger, Corpus Christi, Tex., assignors to Columbia-Southern Chemical Corporation**
**Application April 1, 1952, Serial No. 279,786**
**9 Claims. (Cl. 23—186)**

1. A method of calcining barium carbonate which comprises calcining a mixture of barium oxide and barium carbonate while maintaining the barium oxide content of the mixture in excess of 50 percent by weight of the total amount of the mixture substantially throughout the period of calcination.

---



**2,772,951**
**LOGGING SHALES**
**Donald C. Bond, Crystal Lake, Ill., assignor to The Pure Oil Company, Chicago, Ill., a corporation of Ohio**
**No Drawing. Application August 2, 1951, Serial No. 240,058**
**4 Claims. (Cl. 23—230)**

4. A geophysical well logging process for determining the characteristics and position of clayey strata containing exchangeable cations in the clayey constituents of the strata which comprises collecting samples of said clayey strata at spaced intervals along a bore hole, comminuting each of said samples to produce a plurality of samples each having substantially the same particle size, leach-

ing each of said samples with an ammonium chloride solution to produce an effluent from each of said samples whereby all of the exchangeable cations in each sample are substantially completely replaced by the $NH_4^+$ cation contained in said solution and are contained in said effluent, determining the amount of $NH_4^+$ cation adsorbed by each of said samples, whereby the total cation exchange capacity of each sample is ascertained, quantitatively and qualitatively analyzing the effluent from each of said samples to determine the exchangeable cations contained therein and preparing a well log by correlating the total cation exchange capacity value of each sample, and the determinations of the aforesaid qualitative and quantitative analysis of the effluent from each sample with the position in the well bore from which the sample was obtained.

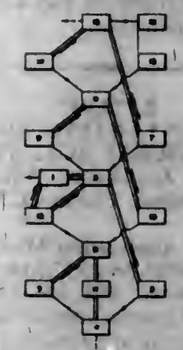
**2,772,952**
**GAS GENERATOR AND METHOD**
**John H. Jacobs, Oakland, Calif.**
**Application January 12, 1952, Serial No. 266,182**
**1 Claim. (Cl. 23—281)**



In a gas generator, a combustion chamber, a burner head disposed to discharge into the chamber, a heat exchanger in communication with the combustion chamber, an air pump or blower, piping means for supplying hot air to the intake side of the blower, heating means serving to heat the air supplied to the blower, said means being in heat exchange relation with products of combustion being delivered from the combustion chamber to the heat exchanger, a proportional mixing device, piping connecting said mixing device with a source of fuel gas at constant pressure, said piping including a metering orifice, piping also connecting said mixing device with the discharge side of the blower, and means for mixing hot air supplied to the blower with air from the surrounding atmosphere, whereby the temperature of the air supplied by the blower to said mixing device remains constant, said last means including a valve means inserted in the piping connected to the intake of the blower, a connection from said valve means to the atmosphere for introduction of atmospheric air, and a thermostatically operated valve member in said valve means to regulate the proportional intermixing of hot and cool atmospheric air.

---

**2,772,953**
**PROCESS OF CONCENTRATING**
**Allen F. Reid, Dallas, Tex.**
**Application January 13, 1954, Serial No. 403,862**
**2 Claims. (Cl. 23—311)**

1. In a process for progressively varying the relative proportions of constituents A, B of a fluid mixture AB in a series *a*, *b*, *c*, *d*, of separation treatment stages, each stage comprising a conditioning treatment and a separation treatment, the steps comprising pre-conditioning said mixture to respond to the action of an agent adapted to separate and retain a portion of the mixture, subjecting said pre-conditioned mixture to the action of said agent in a stage *a* to separate out and retain a portion of said constituents A, B in which the amount of constituent B is reduced relative to constituent A and so that the residual unretained portion of said mixture correspondingly has constituent A relatively decreased with respect to constituent B, subjecting said residual unretained portion from stage *a* to the conditioning treatment of stage *c* serially two positions further along in the system and applying the said portion so conditioned to materal previously separated and retained as a mixture of constituents A and B at said stage *c* to remove said material therefrom conditioning the resultant mixture of constituents A and B for separation and retention in stage *b* between stages *a* and *c* and subjecting said mixture to said separation and retention by an agent in stage *b* to separate out and retain a portion of said mixture constituents A, B in which the amount of constituent B is reduced relative to constituent A and so that the residual unretained portion of said mixture correspondingly has constituent A further relatively decreased with respect to constituent B, subjecting said residual unretained portion from stage

*b* to the conditioning of stage *d* two positions further along the system, applying said portion so conditioned to material previously separated and retained as a mixture of constituents A and B at said stage *d* to remove said material therefrom, conditioning the resultant mixture of constituents A and B for separation and retention treatment in stage *c* between stages *b* and *d*, and subjecting said mixture so conditioned to said separation and retention treatment by an agent in said stage *c* to separate and retain a portion of said mixture of constituents A, B in which the amount of constituent B is reduced relative to constituent A and so that the residual unretained portion of said mixture correspondingly has constituent A further relatively decreased with respect to constituent B, said sequences of conditioning and treatment being repeated to desired relative proportioning of constituents A and B.

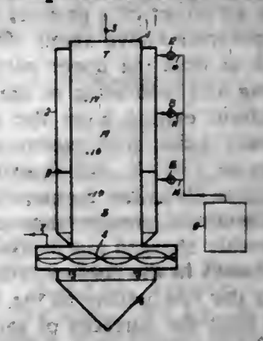
**2,772,954**
**GASIFICATION METHOD**
**Léon Jéquier, Basel, Switzerland, assignor of one-half to Amonia Casale Societa Anonima, Massagno, Ticsin, Italy**
**Application January 24, 1952, Serial No. 267,948**
**Claims priority, application Switzerland January 29, 1951**
**1 Claim. (Cl. 48—202)**

The method of gasifying a powdered fuel mass which comprises the steps of feeding said mass into a fluidization column and along a substantially vertical downward path through said column, dividing said mass during such downward feed into a plurality of discrete layers of substantially equal height spaced from one another along said downward path of feed through said fluidization column, discharging said mass from the lowermost layer into a gasification zone, introducing unused gasification medium into said gasification zone, controlling the velocity of flow of said unused gasification medium within said gasification zone in an upward direction toward said fluidization column, to thereby ensure that said discharged mass when in said gasification zone is maintained in suspended condition therein for combustion purposes, directing used gasification medium and combustion gases from said gasification zone upwardly through said fluidization column to thereby transform said powdered mass into substantially fluidized condition in said column, maintaining throughout said gasification zone a substantially constant temperature sufficient to cause incipient fusion of ash of said mass, to thereby ensure complete combustion of said mass within said gasification zone, and conducting said unused gasification medium as a confined stream at least partly through and in indirect heat exchange with said layers in said fluidization column and in the same direction as the direction of feed of said mass through said fluidization column and simultaneously in indirect heat exchange with said used gasification medium and combustion gases passing through said discrete layers from said gasification zone and in a direction opposite to the direction of feed of said mass prior to the admission of said unused medium to said gasification zone.

---

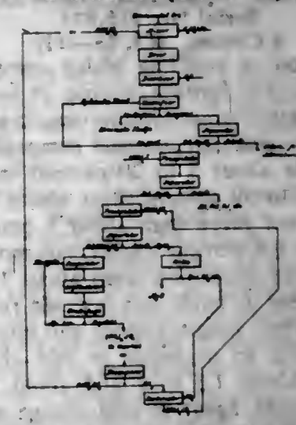


**2,772,955**
**PROCESS FOR THE PRODUCTION OF HYDROGEN AND CARBON MONOXIDE FROM LIQUID FUELS (HEAVY MINERAL OILS)**
**Giacomo Fauser, Milan, Italy, assignor to Montecatini, società generale per l'Industria Mineraria e Chimica, a corporation of Italy**
**No Drawing. Application July 6, 1953, Serial No. 366,378**
**Claims priority, application Italy July 11, 1952**
**11 Claims. (Cl. 48—215)**

1. A process for the production of a synthesis gas consisting substantially of carbon monoxide and hydrogen, said process comprising preheating heavy mineral oil to a temperature of the order of 100 to 150° C., intimately admixing therewith a catalytic amount of a chemical selected from the group consisting of calcium nitrate and magnesium nitrate, atomizing said admixture into an atmosphere of steam and oxygen preheated to a temperature of at least 300° C. and not more than 600 to 700° C., permitting the reaction to take place and adjusting the proportions between said heavy mineral oil, steam and oxygen to maintain a reaction temperature between 1100 and 1200° C.

---

**2,772,956**
**PRODUCTION OF CARBONYL IRON POWDER**
**De Witt Henry West, Port Eynon, and William Thomas Phelps, Swansea, Wales, assignors to The International Nickel Company, Inc., New York, N. Y., a corporation of Delaware**
**Application June 24, 1955, Serial No. 517,876**
**Claims priority, application Great Britain June 28, 1954**
**5 Claims. (Cl. 75—.5)**



1. A process for producing directly in the decomposition space of a carbonyl decomposer a carbonyl-iron powder characterized by a substantially uniform particle size and high Q values at high frequencies of the order of about 20 to 50 megacycles per second and above comprising feeding into the decomposer iron-carbonyl vapor, carbon monoxide, and effective amounts of ammonia in a volumetric ratio of ammonia to iron carbonyl of up to about 1:1, so heating the decomposer that the bottom zone thereof is maintained at a higher temperature than the portions of the decomposer above the bottom zone, the temperature of the bottom zone being between about 370° C. and 500° C., and controlling the grade of carbonyl-iron powder produced by regulating the temperature of the upper zone of the decomposer at a temperature lower than the temperature

of the bottom zone and within the range of from about 270° C. to about 320° C., the fineness of the carbonyl-iron powder produced increasing proportionately as the temperature of the upper zone of the decomposer is increased within the foregoing upper zone temperature range.

---

**2,772,957**
**METHOD OF PROCESSING DISSEMINATED CHROMITE ORES**
**Alfred M. Thomsen, San Francisco, Calif., assignor to American Chrome Company, a corporation of Nevada**
**Application November 9, 1953, Serial No. 391,023**
**2 Claims. (Cl. 75—1)**

1. In a process for resolving a complex ore wherein disseminated chromite is scattered through a matrix composed of a complex metal silicate, the steps consisting in mixing the ore with a sufficient amount of an aqueous solution of ammonium bisulfate to decompose and combine with substantially all of the metal present except chromium, but insufficient to react with the chromite present, whereby there is formed a mixture of metal sulfates, chromite and released silica, heating the mixture to about 500° F. for a period sufficient to dehydrate partially the liberated silica, adding water to the heated mixture to dissolve soluble metal sulfates present and provide a sulfate solution and the silica as one phase and chromite as a solid phase, and separating the two phases.

---

**2,772,958**
**INDURATING PROCESS**
**Donald Beggs, Toledo, Ohio, and Earl R. Johnson, Aurora, Minn., assignors to Erie Mining Company, Hibbing, Minn., a corporation of Minnesota**
**No Drawing. Application February 24, 1953, Serial No. 338,584**
**1 Claim. (Cl. 75—5)**

In the process of indurating initially moist balled-up fluent masses or pellets of finely divided oxidic iron ore

material in a shaft-type indurating furnace, according to which a column of the pellets is established in the furnace and is maintained by withdrawing indurated pellets from the bottom thereof and charging to the stockline thereof raw pellets containing approximately 10% moisture in amounts to maintain substantially the height of the column and wherein a current of a gaseous heating medium initially at a temperature above about 1000° F. is forced upwardly through at least the upper part of the column to effect the drying and indurating of the pellets the gaseous heating medium exiting from the stockline of the column substantially laden with moisture and at a dew point of the order of 130° F., which exit temperature is materially lower than its initial temperature, the method of preventing substantial condensation of moisture on surfaces of the freshly charged moist raw pellets and formation of mud chunks in the column which method consists in delivering the raw pellets to the stockline of the column while at least the surfaces of said pellets are at a temperature not more than 30% lower than the dew-point of the exiting gaseous heating medium and within the range of from about 100° to about 140° F. while the moisture concentration in said pellet surfaces is not significantly altered from said initial moisture concentration.

2,772,959

## METHOD OF ELECTRIC FURNACE SMELTING OF SILICATE ORES

Lyall J. Lichty and Robert T. C. Rasmussen, Ottawa, Ontario, Canada, assignors to Quebec Metallurgical Industries Ltd., Ottawa, Ontario, Canada, a corporation of Canada

No Drawing. Application March 12, 1954, Serial No. 415,977
4 Claims. (Cl. 75—11)

1. The method of smelting which comprises feeding into an electric arc furnace having at least two electrodes an intimate charge mixture consisting of a reducing agent and an oxidized material comprising by weight on the dry basis about 8 to 20 percent iron present as oxide, about 30 to 50 percent silica, about 10 to 30 percent magnesia, not more than about 5 percent alumina, from about 0 to 0.6 percent copper, not more than about 4 percent calcium oxide and from about 1 to 7 percent of a metal present as oxide and selected from the group consisting of nickel, cobalt, copper and mixtures thereof, the ratio of silica to magnesia in said charge mixture being between about 1.5 to 1 and about 2.5 to 1, the amount of reducing agent in said charge mixture being about equal to the stoichiometric amount required to reduce to metal all of said metal oxide and a desired amount of iron oxide, maintaining the power input at not greater than about 27 kilowatts per square foot of hearth area, and maintaining the electrode periphery resistance R within the range from about 1.3 to 2.7 ohm-inches as computed by the formula

$$R \text{ equals } \frac{E}{I} \text{ times } 3.1416 \text{ times } D$$

where E equals the potential drop from electrode to hearth in volts, and I equals current per electrode in amperes and D equals electrode diameter in inches.

2,772,960

## SLAG CAR FOR OPEN HEARTH FURNACES

George H. Todd, Ashland, Ky., and Hugh C. Barnes, Franklin, Ohio, assignors to Armco Steel Corporation, Middletown, Ohio, a corporation of Ohio

Application August 11, 1955, Serial No. 527,675
10 Claims. (Cl. 75—43)

1. The method of handling the effervescent slag resulting from the flushing of an open hearth furnace, which includes the steps of receiving the flushed off slag alternately in two slag pots, changing from one slag pot to the other before the level of the effervescent slag in such

pot reaches the brim of such pot, and permitting the slag in the one, partially filled pot, to subside.

---

2,772,961

## METHOD OF SMELTING

Claude A. Seger, Cobalt, Ontario, Canada, and Philip B. Dettmer, Oakland, Calif., assignors to Quebec Metallurgical Industries Limited, Ottawa, Ontario, Canada, a Canadian company

No Drawing. Application May 16, 1955, Serial No. 508,822
10 Claims. (Cl. 75—82)

1. The method of smelting a finely divided metal compound selected from the group consisting of the hydroxide, oxide, carbonate and mixtures thereof of a metal selected from the group consisting of cobalt and nickel which comprises forming small tightly compressed briquettes of said compound substantially free of slag-forming constituents, forming and maintaining a molten bath consisting essentially of the selected metal in the bottom of a furnace, periodically introducing a carbonaceous reductant upon the molten bath to maintain the metal highly carburized, periodically introducing said briquettes upon the molten bath in amounts to permit said briquettes and reductant to float in a thin layer on said bath and maintain said compound in an unfused condition and be reduced to metal and the latter to be dissolved in the molten bath, discontinuing said introduction of the reductant and briquettes when substantially the desired amount of metal has accumulated in the bottom of the furnace, and thereafter introducing additional briquettes on the bath in amounts such as to cause said compound to be reduced to metal by the residual carbon in the molten metal without fusing said compound and thereby lower the carbon content of the molten metal to a desired amount.

---

2,772,962

## Cu-Mn-Zn RESISTANCE ALLOY

William J. Reichenecker, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

No Drawing. Application January 21, 1954, Serial No. 405,517
6 Claims. (Cl. 75—157.5)

1. A cast electrical resistance member composed of an alloy comprising as its essential ingredients from 10 to 12.5% by weight manganese, from 9 to 13% by weight zinc and the balance being copper, the cast members of the alloy having from 3.5% to 4.3% of the electrical conductivity of copper.

---

2,772,963

## INERT-GAS SHIELDED-ARC WELDING OF 90-10 TYPE COPPER-NICKEL MATERIAL

George Raymond Pease, Westfield, and Theodore Ephraim Kihlgren, Berkeley Heights, N. J., assignors to The International Nickel Company, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application November 6, 1953, Serial No. 390,733
15 Claims. (Cl. 75—159)

5. As an article of manufacture for the use in the inert gas-shielded arc welding of iron-bearing copper-nickel parts, a welding rod composed of an alloy having as essential ingredients at least about 80.4% copper, about 5% to 15% nickel, about 0.1% to 2.0% iron, about 0.1% to 1% manganese, about 0.05% to 0.5% silicon and about 0.02% to 0.5% titanium, the composition of the aforementioned welding rod being controlled so that any lead contamination in the resultant weld metal does not exceed the amount expressed by the equation

$$\text{Maximum percent lead in weld} = 0.08 - 0.2 \times \text{percent silicon in weld}$$

whereby the weld is free from hot cracking.

---

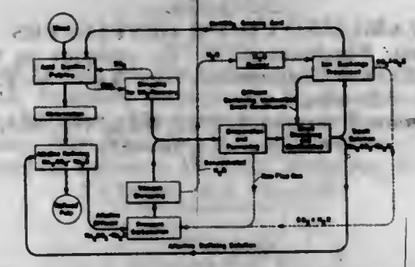
2,772,964

## ZIRCONIUM ALLOYS

Donald E. Thomas, Kenneth M. Goldman, Robert B. Gordon, and William A. Johnson, Pittsburgh, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

No Drawing. Application March 15, 1954, Serial No. 416,396
6 Claims. (Cl. 75—177)

1. An alloy consisting essentially of from 0.1% to 2.5% by weight of tin, and a total of at least 0.1% but not exceeding approximately 2% by weight of at least one metal from period 3 of the periodic table selected from the group consisting of iron, nickel and chromium, carbon not exceeding 0.05%, the balance being zirconium and less than 0.5% by weight of incidental impurities.



---

2,772,965

## RECOVERY OF CHEMICALS IN WOOD PULP PREPARATION

Kenneth Russell Gray, Hartzell Lance Crosby, and John Charles Steinberg, Shelton, Wash., assignors to Rayonier Incorporated, Shelton, Wash., a corporation of Delaware

Application June 2, 1953, Serial No. 359,146
19 Claims. (Cl. 92—2)

1. In the process of preparing wood pulp wherein an alkaline digestion is carried out with a sodium sulfide-containing solution and in which sulfide-containing waste black liquor is evaporated and burned to produce a smelt for the recovery of chemicals, the improvement which comprises carbonating the waste black liquor with carbon dioxide under pressure and then stripping hydrogen sulfide from the carbonated liquor under a vacuum reducing the sulfide sulfur content of the liquor substantially, thereby reducing sulfur losses, recovering concentrated hydrogen sulfide, and minimizing obnoxious odors, and then evaporating the stripped liquor and burning the resulting concentrate.

---

2,772,966

## CATIONIC ROSIN SIZES

John H. Daniel, Jr., and Sewell T. Moore, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application July 28, 1954, Serial No. 446,396
10 Claims. (Cl. 92—3)

10. Paper composed of cellulosic fibers sized by a uniformly distributed content of from about 1% to 5%, based on the dry weight of the fibers, of the cationic rosin size formed by reacting an ester gum at about 175°–250° C. with a water-soluble polyalkylenepolyamine containing at least three nitrogen atoms, the ratio of the rosin solids in said ester gum to the nitrogen atoms of said polyalkylenepolyamine being between about 3:7 and 2:3, at least until the reaction product as its acetate salt forms a colloidal dispersion when agitated with water.

---

2,772,967

## SIZED PAPER

John J. Padbury, Old Greenwich, and John H. Daniel, Jr., and Sewell T. Moore, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application June 28, 1954, Serial No. 439,913
10 Claims. (Cl. 92—3)

1. Paper composed of cellulosic fibers sized by a uniformly adsorbent content within the range of about 1% to 4%, based on the weight of the fibers, of a product corresponding to that formed by heating 1 mol of an amine selected from the group consisting of the lower water-soluble dialkanolamines, the lower water-soluble trialkanolamines and mixtures thereof with a saturated monocarboxylic fatty acid of 16–20 carbon atoms, the molar equivalence ratio of said fatty acid to the hydroxyl groups of said alkanolamine being between about 0.33 and 1.0, at an esterification temperature up to about 225° C. until reaction of said fatty acid with said alkanolamine is at least about 50% complete.

---

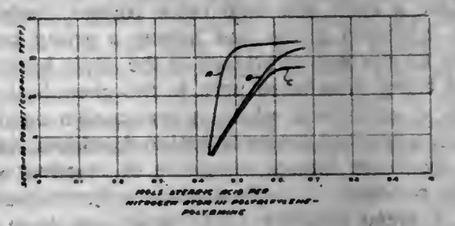
2,772,968

## PROCESS OF PULPING CELLULOSIC MATERIALS WITH TRIETHYLENE GLYCOL

Bror L. Grondal and Piotr Zenczak, Seattle, Wash., assignors to Research Corporation, New York, N. Y., a corporation of New York

No Drawing. Application June 6, 1951, Serial No. 230,254
1 Claim. (Cl. 92—9)

Process for pulping wood chips which comprises immersing wood chips in a bath of triethylene glycol containing from 0.03% to 0.50% by weight of anhydrous aluminum chloride on the basis of the wood chips, maintaining said bath at a temperature of from about 120° C. to 135° C. for a period of from about 1 to 4 hours at atmospheric pressure, and thereafter separating the cellulosic fibers from the digestion liquor.



---

2,772,969

## SIZING OF PAPER WITH FATTY ACID POLYALKYLENEPOLYAMINE COMPOSITIONS

Walter F. Reynolds, Jr., and Leonart A. Lundberg, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

Application November 20, 1952, Serial No. 321,606
8 Claims. (Cl. 92—21)

1. A method of producing sized paper which comprises: adsorbing on cellulosic fibers in the absence of rosin size between about 0.2% and 5%, based on the dry weight thereof, of a long chain fatty acid-polyalkylenepolyamine

reaction product corresponding to that formed by heating a water-soluble polyalkylenepolyamine at an acylation temperature with between about 3/7 and 3/3 molecule of a higher saturated fatty acid for each nitrogen atom in the polyalkylenepolyamine, until between about 50% to about 99% of the fatty acid has reacted with the amine with evolution of water, thereby forming a water-insoluble higher fatty acid salt of a higher fatty acid acylated polyalkylenepolyamine, said polyalkylenepolyamine containing between 3 and 5 nitrogen atoms and said fatty acid containing 14 to 22 carbon atoms, and combining said water-insoluble acylated polyalkylenepolyamine salt with a water-soluble acid to render said acylated polyalkylenepolyamine salt water-dispersible; and heating said treated fibers at between about 105° C. and 150° C. for about ½ to 3 minutes to dry the same and develop the water-repellent properties of the acylated polyalkylenepolyamine thereon.

---

**2,772,970**

## METHOD OF MAKING FIBROUS SHEET MATERIAL CONTAINING A SYNTHETIC RUBBER BINDER

**David A. Feigley, Jr., Manheim Township, Lancaster County, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania**

**No Drawing. Application April 4, 1952, Serial No. 280,657**
**11 Claims. (Cl. 92—21)**

1. The method of making fibrous sheet material containing a synthetic rubber binder comprising forming a slurry containing papermaking fibers, a synthetic rubber latex, and about 2% to about 20% by weight based on said binder of a coagulating agent which is a water-soluble reaction product of relative proportions of about 1 equivalent weight of a water-soluble aluminum salt and at least about 0.6 equivalent weight of a compound selected from the group consisting of water-soluble alpha-omega, carbon chain, aliphatic polycarboxylic acids and water-soluble salts thereof, agitating the resulting slurry to coagulate the solids content of said latex onto said fibers, and forming the slurry of coated fibers into a sheet.

---

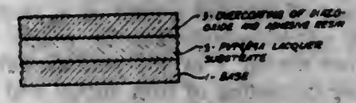
**2,772,971**

## PRODUCTION OF SUBTRACTIVELY COLORED PHOTOGRAPHIC MATERIAL

**Joseph A. Sprung, Binghamton, N. Y., and Willy A. Schmidt, Easton, Pa., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware**

**No Drawing. Original application January 19, 1951, Serial No. 206,938, now Patent No. 2,708,625, dated May 17, 1955. Divided and this application July 9, 1953, Serial No. 367,118**
**10 Claims. (Cl. 96—22)**

1. The process of producing subtractively colored images in a photographic color tripack comprising a base, a red sensitive silver halide emulsion on the base containing a color former capable of reacting with the oxidation products of a primary aromatic amino developer to produce a cyan dye, said color former containing a phenolic hydroxyl group and having a group rendering the color former non-migratory in the silver halide emulsion and being substituted para to the phenolic hydroxyl group by a substituent which is replaceable on development with a primary aromatic amino developer but which renders the color former incapable of reacting with the oxidation products of a β-aromatic sulfonhydrazide developer, a green sensitive silver halide emulsion on the red sensitive emulsion containing a magenta azo color former capable of reacting with the oxidation products of a primary aromatic amino developer, said color former bearing a group rendering it non-migratory in the emulsion and having a free coupling position selected from the class ortho and para to the coupling directing group, and a blue sensitive silver halide emulsion on the green sensitive emulsion containing a yellow azo color former capable of reacting with the oxidation products of a primary aromatic amino developer and having a group rendering it non-migratory in the emulsion, which comprises exposing said tripack, developing it in a black and white developer, re-exposing the tripack to white light, color developing the blue and green sensitive layers only with a β-aromatic sulfonhydrazide developer and subsequently color developing the red sensitive layer with a primary aromatic amino developer.



---

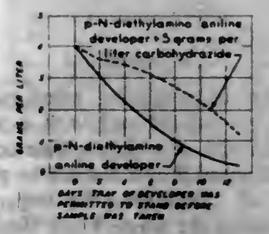
**2,772,972**

## POSITIVE DIAZOTYPE PRINTING PLATES

**Clifford E. Herrick, Jr., Chenango Forks, Peter T. Woitach, Jr., Johnson City, and Edward J. Trojnar, Binghamton, N. Y., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware**

**Application August 20, 1954, Serial No. 451,271**
**20 Claims. (Cl. 96—33)**

1. A plate capable of conversion to an offset printing plate comprising a base, a hydrophobic layer on said base comprising essentially a copolymer of vinyl methyl ether and maleic anhydride on said base and an overcoating on said hydrophobic layer of a water-insoluble, alkali-resistant adhesive resin and a light-sensitive, water-insoluble diazo oxide which is soluble in a solvent selected from the class consisting of liquid aliphatic esters, aliphatic ketones and aliphatic alcohols.



---

**2,772,973**

## STABILIZED COLOR DEVELOPERS

**J W Britain, Binghamton, N. Y., assignor to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware**

**Application February 2, 1955, Serial No. 485,756**
**5 Claims. (Cl. 96—55)**

1. A color developer containing as the active color developing principle a primary aromatic amino developing agent and as a stabilizer therefor against air oxidation the reaction product of carbohydrazide with a compound selected from the class consisting of alkali metal carbonates and bicarbonates.

---

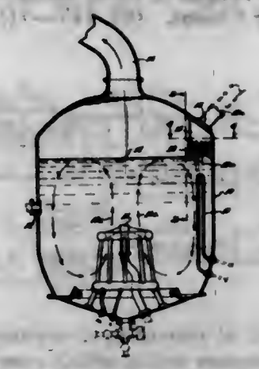
**2,772,974**

## LIGHT SENSITIVE DIAZOTYPE MATERIALS

**Joseph F. Kosalek, Binghamton, and John Salich, Jr., Endicott, N. Y., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware**

**No Drawing. Application February 10, 1954, Serial No. 409,523**
**12 Claims. (Cl. 96—91)**

1. A light sensitive composition for diazotype materials comprising a compatible aqueous dispersion of a light sensitive diazonium compound, coupling component, a polymeric binder material selected from the class consisting of water soluble to water dispersible starches and water soluble polyvinyl compounds and finely divided alumina.



---

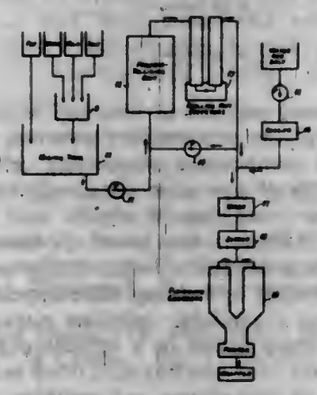
**2,772,975**

## INJECTING OF HOPS IN THE BREWING OF BEER

**Frank Otto Rickers, Cincinnati, Ohio, assignor to The Geo. Wiedemann Brewing Co., Inc., Newport, Ky., a corporation of Kentucky**

**Application July 8, 1955, Serial No. 520,814**
**8 Claims. (Cl. 99—50.5)**

8. The method of brewing malt beverages, comprising the steps of boiling the wort, adding the hops to the boiling wort at a point where the boiling wort is moving downwardly, while producing in the boiling wort, adjacent the point where the hops are being added, a supplementary, highly localized ebullition of such intensity as to produce a fountain, playing onto the hops being added and immediately and thoroughly wetting them down as they are being added, and introducing them under the surface of the wort.



---

**2,772,976**

## METHOD OF MAKING MARGARINE

**Werner H. Schmidt, Englewood, N. J., and Stanley I. Shafer, Melrose, Mass., assignors to Lever Brothers Company, New York, N. Y., a corporation of Maine**

**Application February 18, 1953, Serial No. 337,457**
**7 Claims. (Cl. 99—122)**

1. A method of making margarine from preselected proportions of fat, milk, salt and water which comprises cooling and agitating an emulsion of the fat, milk, a major part of the preselected proportion of salt and a part of the preselected proportion of water to precrystallize the higher melting glycerides therein, rapidly chilling and agitating said emulsion to supercool it, and blending the remainder of the preselected proportions of salt and water with the supercooled emulsion.

---

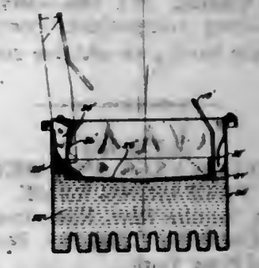
**2,772,977**

## SPICE SUBSTANCE AND METHOD OF PREPARING SAME

**Harry R. Ansel, Chicago, Ill., assignor to Wm. J. Stange Co., Chicago, Ill., a corporation of Illinois**

**No Drawing. Application December 9, 1954, Serial No. 474,299**
**17 Claims. (Cl. 99—140)**

1. The method of making a spice composition from a spice substance as hereinafter defined, comprising grinding the solid components of the spice substance in the presence of a fibrous material, said spice substance being one which in the absence of said fibrous material grinds to a gummy consistency.



---

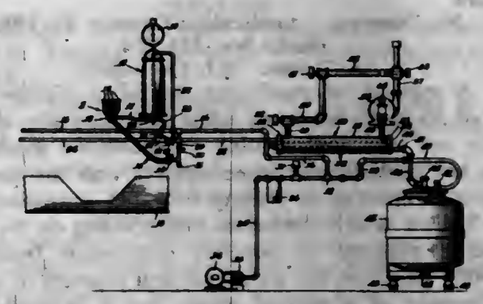
**2,772,978**

## FRY KETTLES WITH FLOATING COVERS

**Harold N. Shaw, Erie, Pa.**

**Application September 26, 1950, Serial No. 186,734**
**18 Claims. (Cl. 99—163)**

18. A method of maintaining fat in proper cooking condition in a fry kettle comprising applying heat to the bottom portion of the kettle to keep the fat continuously hot, and protecting the fat against surface oxidation by placing a cover directly in the fat to contact substantially the entire top surface thereof during intervals when the fat is not being used and while heat is still being applied to the bottom portion thereof.



---

**2,772,979**

## METHOD FOR PROCESSING MILK PRODUCTS

**Roy R. Graves, Valparaiso, Ind., assignor to The Graves-Stambaugh Corporation, a corporation of Delaware**

**Application April 12, 1952, Serial No. 281,961**
**5 Claims. (Cl. 99—184)**

1. The process of producing a canned sterilized milk product, having flavor and odor characteristics comparable to fresh milk and long time keeping characteristics without refrigeration, comprising, initially treating fresh milk to decrease the oxygen content thereof by subjecting the same to partial vacuum and elevated temperatures to provide an initially treated milk having substantially the same percentage of total solids as the fresh milk and an oxygen content of substantially 0.09 volume percent, and then homogenizing, sterilizing and canning the initially treated milk, all without substantial contact with air, which further reduces the oxygen content in the sterilized canned milk to substantially 0.05 volume percent.

2,772,980
**PREPARATION OF ANIMAL BRAINS**
Jean N. Lasparro, Chicago, and Chester J. Filipowicz, Lockport, Ill., assignors to Armour and Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application November 28, 1952, Serial No. 323,154
8 Claims. (Cl. 99—194)

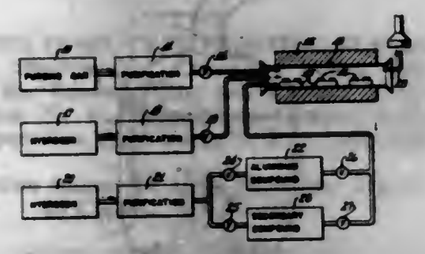
1. The process of treating animal brains which comprises the steps of cleaning and conditioning the brains in sodium chloride and sodium citrate solutions and thereafter blanching the brains.

2,772,981
**PAPER COATING COMPOSITION**
William F. Smart, Sayreville, N. J., assignor to National Starch Products Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application March 17, 1953, Serial No. 342,977
5 Claims. (Cl. 106—283)

1. A paper-coating composition comprising a paper coating pigment slip having an additive consisting of hemicellulose.

2,772,982
**PIGMENTED WAXES AND METHOD OF PREPARING SAME**
Vincent C. Vesce, Smoke Rise, Kinnelon, N. J., assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
No Drawing. Application June 2, 1953, Serial No. 359,223
The portion of the term of the patent subsequent to August 18, 1970, has been disclaimed and dedicated to the Public
16 Claims. (Cl. 106—272)

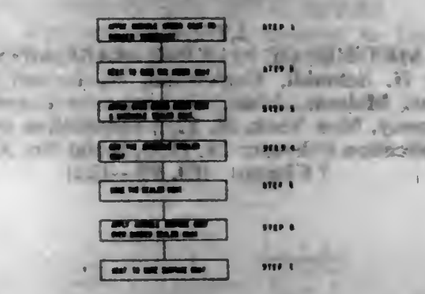
6. A solid organic wax color master batch consisting essentially of pigmented solid organic wax in the form of free-flowing particles possessing a chromaticity not substantially less than the pigment portion thereof.



2,772,983
**ORGANIC PIGMENT PRODUCTION**
Godfrey Grimm, Short Hills, and Alfred A. Brizzolara, Belleville, N. J., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application October 20, 1952, Serial No. 315,254
5 Claims. (Cl. 106—289)

5. A method of stabilizing Benzidine Yellow against loss of strength on aging while retaining the ability to confer on inks and coating compositions made therefrom substantially the same opacity and the same rheological properties as freshly prepared untreated Benzidine Yellow which comprises precipitating on the freshly prepared pigment in aqueous suspension from about 10–30% based on the weight of said pigment of a metallic rosinate of a second group metal between atomic numbers 12 and 56 in the presence of a dialkyl ester of an alkali metal sulfo succinate containing from 1–8 carbon atoms in each alkyl radical.

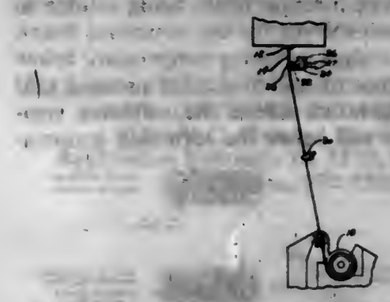
2,772,984
**PIGMENT**
Bertram M. Helfner, Hamburg, N. Y., assignor to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York
No Drawing. Application July 12, 1952, Serial No. 298,624
7 Claims. (Cl. 106—289)



1. Pigments of improved dispersibility and tinctorial value comprising a water-insoluble organic color in finely divided form admixed with an activated silica gel having a surface area of at least 100 square meters per gram, an oil absorption value of at least 100, and an average particle size of from 0.01 to 50 microns, said silica gel being present in amount of from 1/50 to 20 parts by weight per part by weight of organic color.

2,772,985
**COATING OF MOLYBDENUM WITH BINARY COATINGS CONTAINING ALUMINUM**
Eugene Wainer, Cleveland, Ohio, assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application August 8, 1951, Serial No. 240,862
3 Claims. (Cl. 117—71)

1. The method of providing a corrosion-resistant surface on a molybdenum article which comprises depositing a layer of aluminum on said article, and thereafter reacting the resulting coated article with an element selected from the group consisting of boron, silicon, titanium, and zirconium.

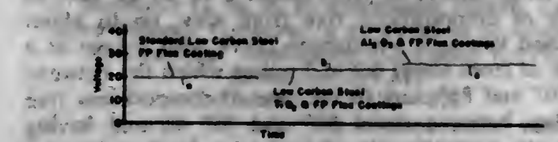


2,772,986
**METHOD OF FINISHING WOOD AND PRODUCT THEREOF**
Allen C. Buck, Drexel Hill, Pa., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Application April 28, 1954, Serial No. 426,312
9 Claims. (Cl. 117—72)

1. An improved method of finishing wood comprising the steps of applying to a wooden substrate a polymerizable undercoat composition comprising cellulose nitrate and at least 45% of a monomeric acrylic diester selected from the group consisting of acrylic acid diesters and methacrylic acid diesters of a lower aliphatic dihydric alcohol in a volatile organic solvent, curing said undercoat to an insoluble stage by heating, superimposing over said cured undercoat a sandable cellulose nitrate containing sealer coating composition in a volatile organic solvent, drying said sealer coat, sanding said dried sealer coat to a desired degree of smoothness and applying over the said sanded sealer at least one coat of polymerizable surface coating composition comprising cellulose nitrate and at least 45% of a monomeric acrylic diester selected from the group consisting of acrylic acid diesters and methacrylic acid diesters of a lower aliphatic dihydric alcohol in an organic volatile solvent, and heating said polymerizable surface coating to cure said acrylic diester, said percentages being based on the total weight of non-volatile film forming components in the respective compositions.

2,772,987
**GLASS COMPOSITION AND METAL COATED GLASS FIBER**
Harry B. Whitehurst, Granville, and William H. Otto, Newark, Ohio, assignors to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Application November 7, 1952, Serial No. 319,388
5 Claims. (Cl. 117—126)

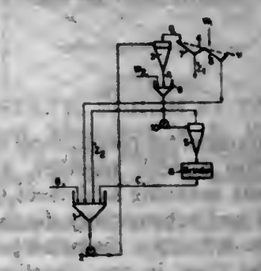
1. Metal coated fibers of a glass composition comprising by weight:



| | Percent |
|---|---|
| $SiO_2$ | 56.9 |
| $Al_2O_3$ | 5.4 |
| $MgO$ | 2.5 |
| $CaO$ | 6.1 |
| $B_2O_3$ | 6.4 |
| $Na_2O$ | 0.5 |
| $K_2O$ | 0.2 |
| $SrO$ | 11.3 |
| $CuO$ | 9.0 |
| $Li_2O$ | 1.7 |

and only minor proportions of any other oxides as impurities.

2,772,988
**METHOD OF WATERPROOFING LEATHER**
Jürgen Plapper and Rudi Heydes, Duesseldorf, Germany, assignors to Böhme Fettchemie G. m. b. H., Duesseldorf, Germany, a corporation of Germany
No Drawing. Application March 16, 1956, Serial No. 571,871
Claims priority, application Germany November 18, 1955
6 Claims. (Cl. 117—135.5)



1. The method of water-proofing leather which comprises impregnating tanned leather with a solution comprising about 1 to 15% by weight, based upon the dry weight of the leather, of an organic metal complex compound produced by reacting a basic salt of a polyvalent metal with an acid phosphoric acid ester of higher-molecular hydroxyl compounds in the presence of a lower-molecular monohydroxy alcohol, and drying the impregnated leather.

2,772,989
**TREATED WIRE FOR ARC WELDING ELECTRODES**
Edward R. Gansberg, Irwin, and Howard C. Ludwig, Pittsburgh, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 19, 1953, Serial No. 331,884
14 Claims. (Cl. 117—204)

1. A consumable welding electrode particularly for use in welding in open air as distinct from welding in an inert gas atmosphere consisting of a homogeneous metallic wire core selected from the group consisting of iron, nickel, and alloys consisting essentially of iron and nickel having on its surface a layer only of a dissociable oxygen containing arc stabilizing compound selected from the class consisting of metal oxides and metal phosphates, said layer having on its surface a flux coating which during the welding operation prevents oxidation of the weld, the compound being in intimate contact with the surface of the core and being present in sufficient thickness to stabilize the arc without producing oxidation of the weld considering the diameter of the core.

2,772,990
**CORN-STARCH PROCESS INVOLVING VORTICAL CLASSIFICATION**
Pieter W. Hage, Koog aan de Zaan, Netherlands, assignor to Stamicarbon N. V., Heerlen, Netherlands
Application August 26, 1952, Serial No. 306,389
Claims priority, application Netherlands September 5, 1951
2 Claims. (Cl. 127—67)

1. In the wet milling process of manufacturing corn starch wherein a mill stream containing process water, starch, bran, gluten and cell conglomerates is produced, the improvement which comprises the steps of vortically separating said mill stream into two fractions, the first of said fractions containing the bulk of the coarse cell conglomerates exceeding a size within the range of from 100 to 200 microns, and the second of said fractions containing the bulk of the process water, starch, bran, gluten and fine cell conglomerates, grinding said first fraction, recycling the ground first fraction with fresh feed to the vortical separation step, screening said second fraction to remove coarse bran exceeding a size within the range of from 100 to 200 microns therefrom, and then separating the final starch product from said second fraction.

2,772,991
**PROCESS OF CLEANING A RESIDUAL POWDER IMAGE FROM AN ELECTROPHOTOGRAPHIC PLATE**
Michael A. Insalaco, Rochester, N. Y., assignor to The Haloid Company, Rochester, N. Y., a corporation of New York
No Drawing. Application December 14, 1954, Serial No. 475,304
10 Claims. (Cl. 134—7)

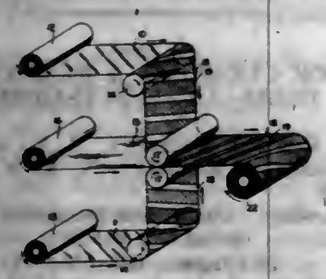
1. The process of cleaning a residual powder image from an element comprising a photoconductive insulating layer on a conductive backing carrying such image, which process comprises passing across said photoconductive insulating surface a mixture of finely-divided barium sulfate and a water insoluble metaphosphate salt.

2,772,992
**PROCESS OF PRODUCING STAINLESS STEEL**
George C. Kiefer and Joseph A. Ferree, Brackenridge, Pa., assignors to Allegheny Ludlum Steel Corporation, Brackenridge, Pa., a corporation of Pennsylvania
No Drawing. Application July 13, 1953, Serial No. 367,766
6 Claims. (Cl. 148—12)

1. A process of producing chromium ferritic stainless steel for deep drawing purposes, said steel consisting of 15 to 22% chromium, not more than .50% nickel, not

more than .25% carbon, not more than 1.25% manganese, not more than 1% silicon and the balance substantially all iron, including as steps an initial hot rolling of the steel followed by at least one cold rolling treatment, which process is characterized by the step of heating the hot rolled steel prior to cold rolling to develop a temperature above about 1900° F. and up to about 2150° F. therein, said processed chromium steel having the characteristic of being capable of being deep drawn without developing roping.

---

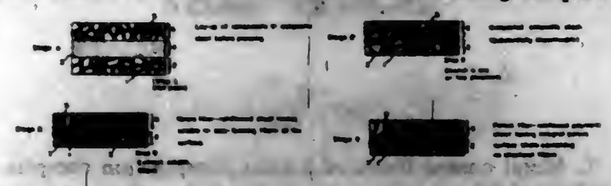


2,772,993
**REINFORCED LAMINATED SHEET**
Elton E. Magnuson, Ann Arbor, Mich.
Application October 17, 1951, Serial No. 251,729
6 Claims. (Cl. 154—52)

1. A laminated transparent plastic sheet comprising two layers of plastic film bonded together, and continuous overlapping filaments spanning said sheet transversely on two sets of parallel and substantially diagonal lines intersecting one another defining a diamond pattern, the filaments traversing the sheet in one direction lying on top of the filaments traversing it in the other direction, each of said filaments extending longitudinally of said layers for a predetermined distance in proximate spaced relation to the edges of said layers so that the several filaments overlap and form reinforcing beads, and all of said filaments being disposed between said layers of film, the edges of the film being folded inwardly around the reinforcing beads.

---

2,772,994
**LAMINATED THREAD**
George H. Lacy, Cleveland, Ohio, assignor to The Dobeckmun Company, Cleveland, Ohio, a corporation of Ohio
Application October 18, 1954, Serial No. 462,753
12 Claims. (Cl. 154—53.6)



1. A thread comprising a metal film interposed between laminated long narrow strips of transparent thermoplastic, and at least one printed color deposit of a given color intermittently overlying said metal film along the length of said long narrow strips, said at least one color deposit being covered by at least one of said narrow strips.

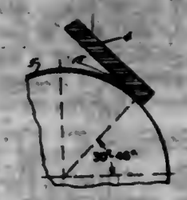
---

2,772,995
**LEATHER REPLACEMENT COMPOSITIONS AND PROCESS**
Joseph Durant Cooper Wilson II, New Castle, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Application May 7, 1954, Serial No. 428,356
12 Claims. (Cl. 154—124)

1. The process of forming non-woven, porous leather replacement fabrics which comprises associating substantially water vapor-impermeable, relatively extensible, initially thermoplastic, elastomeric, polymeric binder material with a fibrous sheet comprising essentially a non-woven base stratum of uniformly dispersed structural fibers of relatively non-extensible material, and a non-woven surface stratum of uniformly dispersed soluble pore-forming fibers and free of structural fibers to form an initial sheet, said pore-forming fibers being soluble in a solvent which is a non-solvent for the structural fibers, said binder material having a softening temperature below the softening temperature of said fibers; hot-pressing said initial sheet at a temperature above the softening temperature of said binder and below the softening tempera-

ture of said fibers, whereby to form a compacted substantially water vapor-impermeable sheet wherein said fibers are embedded in said binder; stretching said compacted sheet 10% to 50% in at least one direction to form channels substantially contiguous with the structural fibers distributed uniformly throughout the base stratum; and dissolving out said pore-forming fibers with a liquid which is a solvent for said pore-forming fibers and a non-solvent for said structural fibers and said binder material, whereby to form a porous, water vapor-permeable sheet of polymeric binder material reinforced with structural fibers and having a porous surface stratum free of fibers.

---



2,772,996
**BORATED-SILICATE-STARCH LAMINATING ADHESIVES AND MANUFACTURE OF COMBINED FIBERBOARD THEREWITH**
Robert H. Sams, Darby, Pa., assignor to Philadelphia Quartz Company, Philadelphia, Pa., a corporation of Pennsylvania
Application October 15, 1953, Serial No. 386,230
17 Claims. (Cl. 154—138)

8. In the manufacture of laminated paper board on high-speed laminating machines wherein at least two plies are combined with an adhesive containing a sodium silicate solution as its aqueous phase having a viscosity within the range of from about 0.25 to 15 poises and a gravity of from about 30 to 50° Bé. at 20° C. with a percent ratio of $NaO_2$ to $SiO_2$ within the range of from about 1:2 to 1:4.2 and containing substantially uniformly dispersed therein from about 1.5 to 10 percent by weight of a raw unswelled starch-like material which has the property of swelling by hydration before going into solution when heated in water to temperatures within the range of from about 55° to 80° C., from about 15 to 150 percent by weight of an alkali metal borate based on the starch-like material in the adhesive, and usually from about 1 to 25 percent by weight of a finely-divided solid siliceous material having an average particle size not substantially exceeding 2 microns; the said silicate solution constituting at least about 50 percent of the adhesive as a whole; the said adhesive having an over-all viscosity at operating temperatures of from about 0.2 to 15 poises, a filter test at operating temperatures of from about 2 to 20 cc. and, in the case of compositions free from clay, up to about 30 cc., and having a Viscograph curve with a knee at a viscosity of from about 0.2 to 3 poises which lies between about 70° and 85° and, in the case of compositions free from clay, between about 60° and 75° C. and having the characteristic property of increasing in viscosity at a rate substantially higher than that of a similar adhesive free from said alkali metal borate when heated to temperatures within the range of from about 55° to 90° C.; the process which comprises applying to the face of a ply to be laminated the adhesive defined above, immediately combining the adhesive-coated face with another ply under pressure and heating the adhesive substantially simultaneously with its application to temperatures within the range of from about 55° to 90° C., whereby a flash bond is produced capable of withstanding cutting, scoring and other mechanical operations and stronger than that produced by a similar adhesive free from said borate.

---

2,772,997
**ILLUMINATED AND EDGE-LIGHTED ARTICLES AND METHODS OF MAKING SAME**
Richard C. Webster, Burlington, Mass.
Application February 13, 1950, Serial No. 143,945
8 Claims. (Cl. 154—138)

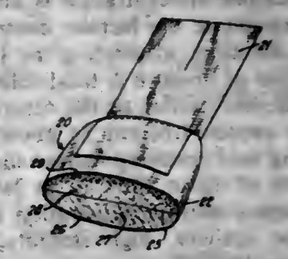
4. In the forming of an edge-lighted display element comprising a flexible sheet having a fibrous interstitial decorated surface adhesively secured to a transparent plate like member of material having the property of internally reflecting light rays supplied through an edge of the member, a method of obtaining a display that does not exhibit any greyish or silvery haze at the zone of adhesion and which thus affords a brilliant unhazed front view of the surface decoration of the sheet when viewed through the member under conditions of edge illumination, which method consists in arranging the sheet decorated face up as a convex arc, arranging the plate like member at a downward inclination and in tangential contact with a linear edge of the arched sheet below the crest of its arc, maintaining a pressure of the plate like member against the line of tangential contact at less than that which would appreciably distort the fibers of the sheet, flowing over the arcuate surface of the sheet a bubble free liquid capable of wetting the sheet and producing an adhesive bond between the sheet and the plate like member equal in index of refraction to that of the body of the plate like member and forming a well of said liquid between the arched sheet and plate adjacent the line of tangency thereof, then simultaneously linearly moving the plate like member and peripherally rotating the arcuate sheet to bring them progressively into liquid submerged contact at the line of tangency thereof while maintaining the well of bubble free liquid thereat so that the undeformed fibrous surface of the sheet is impregnated and its interstices filled with liquid adhesive material to the exclusion of bubbles and gaseous voids, and permitting the bond to set.

---

2,772,998
**CHOLINE SALT TABLET AND PROCESS OF MAKING SAME**
Hermann Rudy, Heidelberg, Germany, assignor to Joh. A. Benckiser G. m. b. H. Chemische Fabrik, Ludwigshafen (Rhine), Germany, a corporation of Germany
No Drawing. Application November 7, 1952, Serial No. 319,417
9 Claims. (Cl. 167—82)

2. A process for tableting choline salts, comprising thoroughly mixing a hygroscopic choline salt with a smaller quantity of dehydrated calcium citrate and with a mold lubricant, said dehydrated calcium citrate and said mold lubricant being present in a quantity which renders the formed mixture substantially non-adherent to the tableting mold and tableting the formed mixture.

---



2,772,999
**HEMOSTATIC SURGICAL COMPOSITIONS AND DRESSINGS**
Joseph N. Masci, Metuchen, and William L. George, Middlesex, N. J., assignors to Johnson & Johnson, a corporation of New Jersey
Application June 6, 1952, Serial No. 292,144
18 Claims. (Cl. 167—84)

1. A surgical composition for coagulating blood containing a hemostatic amount, at least about 2%, of cellulose derivative of the group consisting of free acid cellulose glycolic acid ether and free acid cellulose hydroxypropionic acid ether having degree of substitution at least about 0.5, and degree of neutralization in the approximate range 0 to 60% but sufficiently low so that the free carboxy content of the cellulose is at least 0.5 per glucose unit.

---

2,773,000
**HEMOSTATIC SURGICAL DRESSINGS**
Joseph N. Masci, Metuchen, N. J., William H. Ashton, Philadelphia, Pa., and Julius Wiland, New Brunswick, N. J., assignors to Johnson & Johnson, a corporation of New Jersey
Application June 6, 1952, Serial No. 292,145
10 Claims. (Cl. 167—84)

1. A surgical dressing having adjacent a wound-contacting external surface thereof, a non-toxic hydrophilic aliphatic poly-ol compound normally existing in non-crystalline condition and in amount sufficient to produce easy removal of said dressing from a clot of blood, said dressing also containing cellulose derivative of the group consisting of free acid cellulose glycolic acid ether and free acid cellulose hydroxypropionic acid ether in hemostatic amount at least about 0.30 mg. per square inch of said surface, said cellulose derivative having degree of substitution at least about 0.5 and degree of neutralization in the approximate range of 0 to 60% and sufficiently low so that the free carboxy content of the cellulose is at least 0.5 per glucose unit, said cellulose derivative further having degree of polymerization indicated by viscosity of a 0.50% by weight solution of the free acid in a 0.50 N NaOH solution at 25.50° C. of at least 5.7 seconds as determined in a modified Ostwald-Fenske viscosimeter pipette ASTM D-445 #300, as compared with a zero pipette reading of 5.0 seconds for a 0.50 N. NaOH solution at the same temperature.

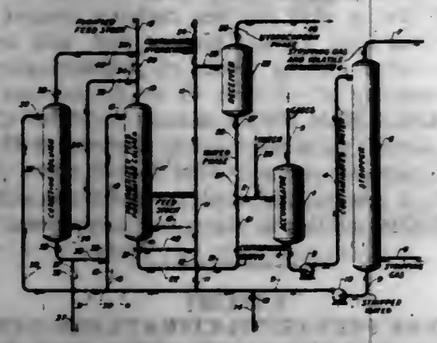
---

2,773,001
**METHOD OF PREPARING CITRATE ION-DERIVED L-GLUTAMIC ACID**
Carl V. Smythe, Moorestown, N. J., and Hsing T. Huang, Elkins Park, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware
No Drawing. Application May 27, 1954, Serial No. 432,907
8 Claims. (Cl. 195—30)

1. A method for preparing L-glutamic acid which comprises treating with a lysate of a yeast which oxidizes citric and glutamic acids an aqueous solution contain-

ing citrate ions as the exclusive carbon atom-yielding starting material and ammonium ions in an amount at least molecularly proportional to the citrate, said solution having a pH of 6 to 8.5, being at a temperature of 20° to 40° C., and having a concentration between 0.01 and about 0.2 molar with respect to citrate, permitting the lysate to act on said solution, whereby at least one decarboxylation occurs and at least one amination takes place, and recovering the resulting citrate derived glutamate content.

---

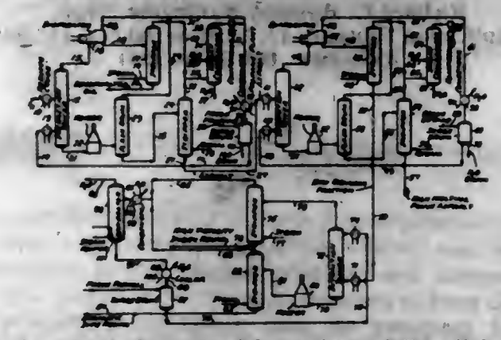


**2,773,002**
**PURIFICATION OF LACTASE ENZYME AND SPRAY-DRYING WITH SUCROSE**
**William M. Connors, Bay Shore, and Theodore Sfortunato, Patchogue, N. Y., assignors to National Dairy Research Laboratories, Inc., Islip, N. Y., a corporation of Delaware**
**No Drawing. Application March 31, 1955, Serial No. 498,434**
**7 Claims. (Cl. 195—63)**

1. A process for the isolation and purification of lactase from a dried lactase yeast which comprises agitating a dried lactase yeast in an aqueous potassium phosphate buffer solution having a solids content of about 5% to 15% at a pH within the range from about 6.5 to 7.2 and a temperature of less than about 40° C. for about 4 to 20 hours, centrifuging a lactase solution from the resulting slurry, cooling the lactase solution to about 40° F. and adding acetone at about 40° F. to said lactase solution until the acetone concentration is about 40 to 50% by weight to precipitate the lactase, centrifuging the lactase from said solution, suspending the lactase in water to a concentration of about 8% total solids, centrifuging, and adding a sucrose carrier to the centrifugate to bring the final solids content thereof to about 12% to 20% and spray drying said resulting lactase-sucrose dispersion at a temperature of about 175° F. to 265° F., whereby a spray-dried lactase-sucrose preparation is obtained having high lactase activity, high stability, and excellent flavor in milk products.

7. A lactase preparation having high lactase activity, high stability and excellent flavor in milk products consisting of homogeneous spray-dried particles of lactase and sucrose.

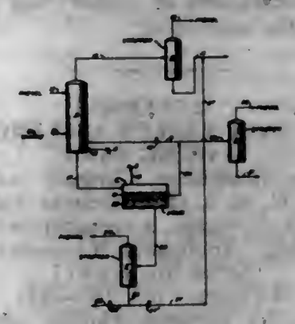
---



**2,773,003**
**WASTE WATER TREATMENT**
**Kenneth M. Brown, Hinsdale, and James E. Gantt, Elmwood Park, Ill., assignors to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware**
**Application April 16, 1953, Serial No. 349,282**
**7 Claims. (Cl. 196—1)**

1. The method of treating waste water from petroleum refining processes to remove volatile contaminants and phenols therefrom which comprises passing said waste water into countercurrent contact with a stream of stripping gas, separately recovering the resultant volatile contaminant-containing stripping gas stream and a treated water stream containing phenols, and passing at least a portion of said treated water stream into contact with volatile contaminant-containing hydrocarbons to remove volatile contaminants from the hydrocarbons and to effect a transfer of phenols from the water stream to the hydrocarbons.

---

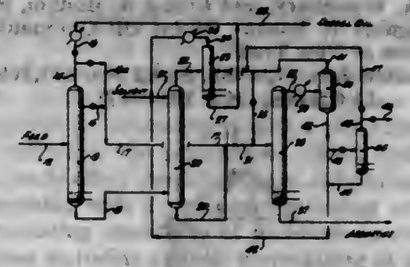


**2,773,004**
**SOLVENT RECOVERY OF RESINS FROM PRECIPITATED ASPHALT**
**Edward J. Martin, Homewood, Ill., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine**
**Application March 18, 1952, Serial No. 277,203**
**2 Claims. (Cl. 196—14.15)**

1. A process for recovering substantially oil-free high viscosity index resins and substantially oil-free aromatic type resins in petroleum which comprises contacting a residual stock with a liquid, normally gaseous paraffin precipitant to precipitate an asphalt fraction which contains a raw resinous fraction, contacting the asphalt fraction with a butane solvent at a butane to asphalt ratio exceeding about 5 to 1 at an elevated temperature below the critical temperature of the solvent and under superatmospheric pressure sufficient to maintain the solvent in liquid phase, separating the raw resinous fraction as extract, stripping the solvent from the raw resinous fraction, subjecting the raw resinous fraction to extraction at a temperature of about 160° to 260° F. with a selective solvent having a high selectivity for aromatic components at a total solvent to raw resin ratio of about 0.5 to 5:1, and recovering a high viscosity index resinous fraction from the raffinate and an aromatic resinous fraction from the extract.

---

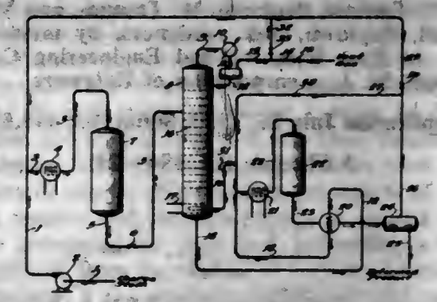
**2,773,005**
**METHOD FOR OBTAINING AN OXIDATION INHIBITOR AND AN OXIDATION RESISTANT LUBRICATING OIL**
**Herbert W. H. Meyer and Edward F. Wadley, Baytown, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware**
**Application September 17, 1954, Serial No. 456,700**
**2 Claims. (Cl. 196—14.17)**



1. A method for obtaining an improved oxidation resistant lubricating oil including the steps of extracting in a first extraction zone in the presence of phenol and water a paraffinic light motor oil distillate to separate it into an extract phase and a raffinate phase, removing said raffinate phase from said first extraction zone and stripping phenol therefrom to recover a motor oil fraction, removing the first extract phase from said first extraction zone, passing it to a separation zone and there adding from 3% to 6% by volume water thereto to cause phase separation therein to form a second extract fraction and a second raffinate fraction, separately removing said second extract fraction and said second raffinate fraction from said separation zone, stripping the phenol from said second extract fraction to recover a finished oxidation inhibitor and admixing at least a portion of said finished oxidation inhibitor with said motor oil fraction to recover a finished oxidation resistant lubricating oil.

---

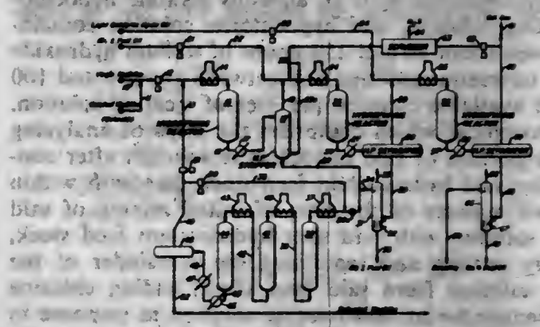
**2,773,006**
**SEPARATION OF HYDROCARBONS**
**Harold E. Carver, Brea, and George R. Lake, Long Beach, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California**
**Application March 4, 1955, Serial No. 492,176**
**14 Claims. (Cl. 196—14.25)**



1. A process for segregating a hydrocarbon oil containing aromatic and non-aromatic hydrocarbons boiling over the same temperature range of at least about 80° F. into a relatively aromatic portion and a relatively non-aromatic portion, which comprises fractionally distilling said oil to recover (1) a bottoms fraction amounting to between about 30% and 70% by volume of the feed oil, and (2) a lower-boiling fraction amounting to the major part of the total feed oil boiling below said bottoms fraction; subjecting said bottoms fraction to solvent extraction with a solvent which (1) is a selective solvent for aromatics, (2) is a selective azeotrope former for non-aromatics, and (3) boils approximately within the boiling range of said lower-boiling fraction of feed; recovering from said extraction a hydrocarbon raffinate which is relatively non-aromatic and an extract which contains a relatively aromatic hydrocarbon solute; subjecting said extract plus said lower-boiling fraction to mutual azeotropic distillation, recovering from said azeotropic distillation a bottoms fraction which is relatively rich in aromatic hydrocarbons, and an azeotropic overhead of solvent plus relatively non-aromatic hydrocarbons; separating the solvent from said azeotropic overhead and combining said relatively non-aromatic hydrocarbons from said azeotropic overhead with said relatively non-aromatic hydrocarbon raffinate.

---

**2,773,007**
**PROCESS FOR HYDROFINING AND REFORMING FEED STOCKS**
**Clarence G. Gerhold, Riverside, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware**
**Application July 24, 1952, Serial No. 300,642**
**7 Claims. (Cl. 196—28)**



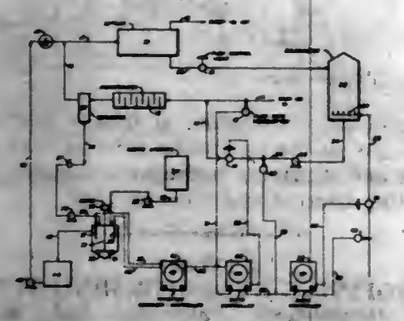
6. A process for the conversion of a sulfur-containing hydrocarbon distillate boiling in the gasoline range which comprises contacting said distillate in a treating zone with a hydrogenation catalyst in the presence of hydrogen under conditions to convert sulfur compounds to hydrogen sulfide, introducing the effluent of the treating zone into a separating zone and therein contacting the same with an ascending gas stream to strip hydrogen sulfide therefrom, removing the desulfurized gasoline distillate from the separating zone and catalytically reforming the same in the presence of hydrogen, separating a hydrogen-containing gas from the resultant reformed

gasoline products, introducing at least a portion of the last-named gas to the separating zone as said ascending gas stream and supplying hydrogen-containing gas from the separating zone to said treating zone.

---

**2,773,008**
**HYDROFINING-HYDROFORMING SYSTEM**
**Robert J. Hengstebeck, Valparaiso, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana**
**Application April 26, 1954, Serial No. 425,461**
**12 Claims. (Cl. 196—28)**

1. A hydrocarbon conversion process which comprises hydrofining a sulfur-containing naphtha at a pressure in the range of about 200 to 1500 p. s. i. g. and a temperature in the range of 600–800° F. in a first hydrofining zone, cooling the effluent from the first hydrofining zone at substantially hydrofining pressure to condense hydrocarbons higher boiling than hexane without condensing appreciable amounts of pentanes and lower boiling hydrocarbons, separating in a first separation zone at a temperature above 200° F. condensed hydrocarbons from a hydrogen stream containing $H_2S$ and uncondensed hydrocarbons, contacting said hydrogen stream and a distillate hydrocarbon fuel which is higher boiling than gasoline with a hydrofining catalyst in a second hydrofining zone at a temperature in the range of about 600 to 800° F. and at a slightly lower pressure than that maintained in the first named hydrofining step so that the hydrogen stream requires no further compression between said first and second hydrofining zones, cooling the second hydrofining reaction zone effluent, separating condensed hydrocarbons therefrom at substantially hydrofining pressure in a second separation zone and distilling said separated hydrocarbons to obtain a distillate fuel oil and a naphtha fraction, contacting said first named condensed hydrocarbons with a platinum-on-alumina catalyst at a temperature in the range of about 850 to 950° F. under a pressure in the range of about 200 to 750 p. s. i. to effect hydroforming, separating a hydrogen stream containing low boiling hydrocarbons from hydrocarbons produced in the hydroforming step, recycling most of the last named separated hydrogen stream to the hydroforming step and introducing the remainder to the first named hydrofining step.



2,773,009

## CONTROLLED HYPOCHLORITE SWEETENING PROCESS

Harold W. Earhart, Benjamin W. Thomas, and Mathis T. Waddell, Baytown, Tex., assignors, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

Application July 26, 1954, Serial No. 445,555

3 Claims. (Cl. 196—29)

1. In a continuous hypochlorite sweetening process in which a sour petroleum hydrocarbon feed stock is intimately contacted with an aqueous alkaline hypochlorite treating solution, said hypochlorite solution containing between about 50 and 250 grams of sodium hydroxide per liter of treating solution and between about 1 and 100 grams of available chlorine per liter of treating solution, the improvement which comprises the steps of analyzing a sample portion of said hypochlorite solution after contacting the said hydrocarbon feed stock therewith within about two minutes of the time of initial mixing of said treating solution with said sour hydrocarbon feed stock, separately settling and separating the remainder of the treating solution from said feed stock, adding chlorine to said remainder of said treating solution in response to said analysis in an amount sufficient to reactivate the same and employing said reactivated solution containing said added chlorine to contact additional quantities of said sour hydrocarbon feed stock, the amount of chlorine added in response to said analysis being sufficient to provide an available chlorine content for said sample portion within the range of about 0.1 to 1.0 grams of available chlorine per liter of sample solution.

## DOCTOR PROCESS

Mathew L. Kalinowski, Chicago, and Garbis H. Meguerian, Park Forest, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application April 16, 1954, Serial No. 423,840

4 Claims. (Cl. 196—33)

1. A doctor sweetening process which comprises (1) adding to a sour petroleum distillate boiling below about 750° F. between about 0.001 and 0.1 weight percent of at least one aliphatic amine selected from the class consisting of (*a*) primary aliphatic amines containing at least 8 carbon atoms, (*b*) secondary aliphatic amines containing at least 5 carbon atoms in each aliphatic group and (*c*) tertiary aliphatic amines containing at least 3 carbon atoms in each aliphatic group, (2) contacting said amine-containing sour oil with doctor solution and with free sulfur in an amount at least sufficient to sweeten said distillate, and (3) separating an essentially sweet amine-containing distillate from doctor solution.

2,773,011

## HYDROGEN REFINING HYDROCARBONS IN THE PRESENCE OF AN ALKALI METAL-CONTAINING PLATINUM CATALYST

Vladimir Haensel, Hinsdale, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application August 30, 1951, Serial No. 244,451

13 Claims. (Cl. 196—36)

2. A process for the purification of a hydrocarbon fraction containing nitrogen compounds which comprises subjecting said fraction to treatment with hydrogen at a temperature of from about 400° to about 850° F. in the presence of a catalyst comprising alumina, platinum and a component selected from the group consisting of alkali metals and compounds thereof.

## METHOD AND APPARATUS FOR CONTINUOUS PERCOLATION OF OILS

Joe E. Penick, Woodbury, and Ernest A. Bodkin, Pitman, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application July 17, 1951, Serial No. 237,266

11 Claims. (Cl. 196—47)

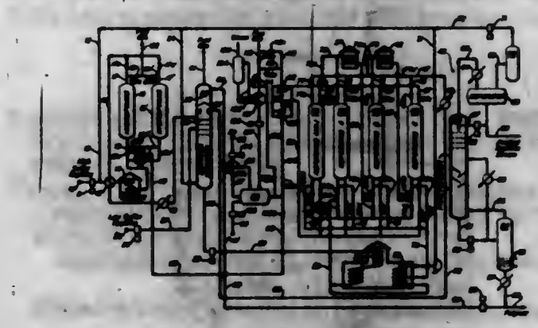
1. A method for effecting countercurrent contact with a moving adsorbent and liquid hydrocarbons which remain in the liquid phase during the contacting which comprises, passing an adsorbent in palpable particle form downwardly as a column of gravitating particles through a confined treating zone, supplying the liquid hydrocarbon feed to at least one plenum space near the lower end of said column, ejecting the liquid feed from said plenum space through a plurality of uniformly spaced flow restricting passages whereby a plurality of liquid streams are formed and directing said streams into the lower section of said column, the number of said streams, N, depending upon the height, L, in feet and the horizontal cross-sectional area, A, of said column in square feet, and being equal at least to that defined by the equation

$$N=\frac{96.7A}{L^{1.07}}$$

and less than that defined by the equation

$$N=\frac{537A}{L^{1.39}}$$

passing the liquid hydrocarbons upwardly through said column at a velocity controlled below the column disrupting velocity whereby the hydrocarbons are effectively countercurrently contacted with the adsorbent, withdrawing the treated liquid hydrocarbons from the upper section of said column, passing the contacted adsorbent downwardly past but out of communication with said plenum space and withdrawing it from the lower end of the treating zone so as to cause the adsorbent to flow downwardly in said column.



2,773,013

## HYDROCARBON REFORMING SYSTEM FOR HIGH SULFUR NAPHTHAS

Joseph E. Wolf and Donnell H. Wagner, Hammond, and James A. Bock, Crown Point, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

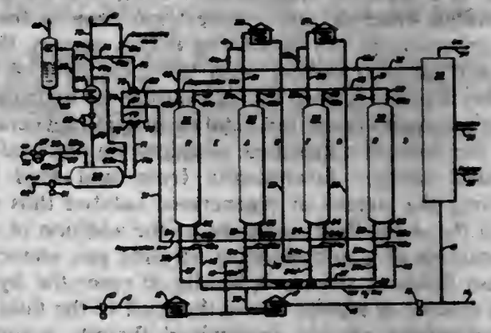
Application April 9, 1953, Serial No. 347,634

15 Claims. (Cl. 196—50)

1. The method of converting a low octane number naphtha containing more than .1 percent sulfur and rich in paraffins and naphthenes into a high octane number naphtha product which method comprises hydrofining said naphtha by contacting it with a sulf-active hydrogenation catalyst in the presence of added hydrogen under conditions to effect desulfurization, reforming said hydrofined naphtha with a platinum-containing reforming catalyst consisting essentially of platinum-on-alumina under conditions including an inlet temperature of at least about 950° F. for increasing the octane number of said naphtha and producing hydrogen, separating hydrogen from the reforming product stream, recycling a part of said hydrogen to the reforming step, recycling another part of said hydrogen to the hydrofining step, periodically regenerating at least a part of the platinum-containing catalyst while other parts of the platinum-containing catalyst are on-stream by contacting said part of the platinum-containing catalyst with flue gas containing added oxygen to substantially remove carbonaceous deposits of combustion and then contacting the substantially carbon-free catalyst with a gas having an oxygen partial pressure of at least .4 atmosphere at a temperature approximating the temperature employed in the reforming step for a time sufficient to restore the catalyst substantially to its original activity, recycling gas leaving the regenerating step through a temperature control zone back to said regeneration step and employing at least a part of the recycled gas stream from the temperature control zone for effecting regeneration of a part of the hydrofining catalyst while said last named catalyst is not on-stream.

---

2,773,014



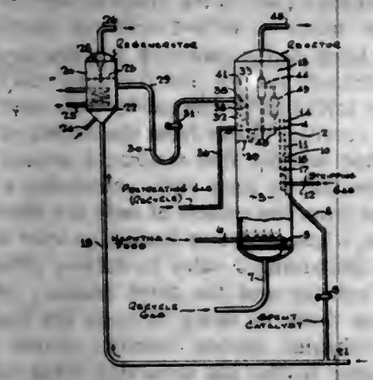
## HYDROCARBON REFORMING WITH PLATINUM CATALYST AND REGENERATION SYSTEM THEREFOR

John F. Sauger, Chicago, Ill., and James A. Bock, Crown Point, and Joseph E. Wolf, Hammond, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

Application April 9, 1953, Serial No. 347,635

17 Claims. (Cl. 196—50)

1. A regenerative, platinum-catalyst, naphtha hydroforming system which comprises at least four reactors herein called alternate, first, second and third reactors respectively, each adapted to contain a bed of platinum catalyst, a lower regeneration gas line, a connection including a valve between the bottom of each reactor and said lower regeneration gas line, an upper regeneration gas line, a connection including a valve between the top of each reactor and the upper regeneration gas line, a regeneration system connected to said lower and upper regeneration gas lines, a charging stock heater, first reheater and second reheater respectively, an inlet at one end of each reactor and an outlet at the other end thereof, a charging stock heater discharge line alternately connected by lines each containing a valve to discharge only to the alternate reactor and the first reactor inlets, a first reheater discharge line connected by lines each containing a valve to discharge only to the alternate reactor and the second reactor inlets, a second reheater discharge line connected by lines each containing a valve to discharge only to the alternate reactor and the third reactor inlets, a first reheater inlet line connected by lines each containing a valve to receive effluent from the outlets of only the alternate reactor and the first reactor, a second reheater inlet line connected by lines each containing a valve to receive effluent from the outlets of only the alternate and second reactor, a gas separator having an inlet connected by lines each containing a valve to receive effluent from the alternate reactor and the third reactor, whereby a naphtha charge flows in series through the heater, first reactor, first reheater, second reactor, second reheater, and third reactor to the gas separator while catalyst in the alternate reactor is undergoing regeneration and whereby the alternate reactor may be connected in parallel with any selected one of the first, second and third reactors respectively and take the place thereof in any desired sequence so that any selected reactor may be taken off stream for regeneration without interrupting charging stock flow through the system or changing the order of said flow through the preheaters of the system.



13. In a platinum-catalyst, naphtha hydroforming process wherein a naphtha charge of low sulfur content is preheated and introduced with preheated hydrogen to a first reaction zone, effluent from the first zone is reheated and introduced into a second reaction zone, effluent from the second zone is reheated and finally introduced into a last reaction zone from which it is passed through a cooling zone to a separation zone and hydrogen is recycled from the separation zone through a preheating zone for introduction to the first zone, the improved method of operation which comprises periodically connecting any selected reaction zone in parallel with an alternate reaction zone of approximately the same size as the first, second and last reaction zones respectively, each of the reaction zones containing a bed of supported platinum catalyst, blocking off the selected reaction zone to take it off stream while the alternate zone takes its place in the on-stream sequence, purging hydrogen from the off-stream reaction zone, then regenerating catalyst in the off-stream reaction zone by burning carbonaceous deposits therefrom with a gas having a low oxygen content, then purging oxygen from the off-stream zone and thereafter replacing the purge gas with hydrogen, then placing the selected reaction zone back on stream and thereafter taking the alternate reactor off stream, and in the same manner replacing other of the first, second and last reaction zones with the alternate reaction zone in any desired sequence so that each of the reaction zones including the alternate may undergo regeneration while in off-stream position without interrupting the on-stream flow and without changing the sequence of flow through the preheating and the two reheating steps.

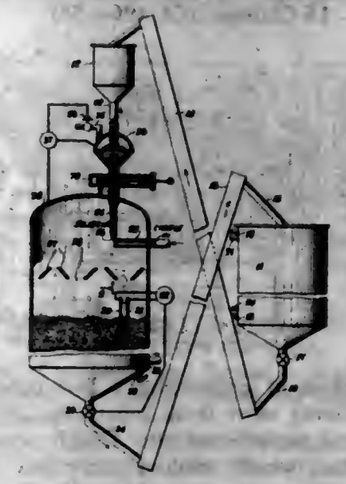
## FLUID HYDROFORMING PROCESS

Richard J. Yoder, Elizabeth, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application April 30, 1952, Serial No. 285,146
3 Claims. (Cl. 196—50)

1. In a process for hydroforming hydrocarbons in the naphtha boiling range using a finely divided solid metal oxide hydroforming catalyst according to the fluidized solids technique, the improvement which comprises continuously withdrawing a dense fluidized stream of spent catalyst particles from a fluid bed of catalyst maintained within a reaction zone, conveying the said spent catalyst particles to a separate regeneration zone, subjecting the spent catalyst entering said regeneration zone to the action of an oxidizing gas containing excess oxygen, thereby at least partly removing from the spent catalyst carbonaceous deposits formed thereon during the hydroforming reaction, maintaining the catalyst in said regeneration zone in the form of a fluid bed, withdrawing oxidized and regenerated catalyst downwardly from said fluid bed, maintaining the stream of regenerated catalyst thus withdrawn in the dense fluid condition by the addition of only small amounts of a non-reducing aerating gas, conveying this dense fluidized stream upwardly to enter the hydroforming reactor at a point above the level of the fluid bed of hydroforming catalyst maintained therein, maintaining a stripping section at an upper level within said reactor, causing said regenerated catalyst stream to enter said stripping section and to fall therein countercurrently to a rising stream of a reducing and stripping gas present in an amount sufficient to partially reduce the oxidized catalyst and to entirely remove the water vapor formed by said partial reduction, feeding a hydrogen-containing reducing gas to said stripping section at a point above said fluid bed level, removing the stripping gas overhead out of contact with the catalyst in said fluid bed but in mixture with the vaporous reaction products from said fluid bed and passing stripped catalyst downward from said stripping zone into the main fluid bed of hydroforming catalyst.



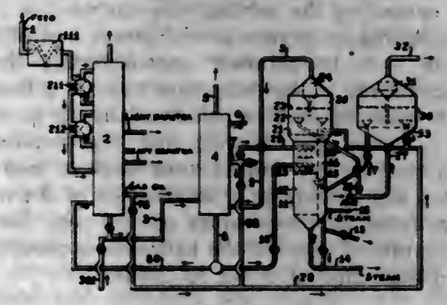
**2,773,016**

## METHOD OF FEEDING GASEOUS HYDROCARBONS IN A MOVING BED HYDROCARBON CONVERSION PROCESS

Raymond R. Halik, Pitman, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

Application February 25, 1953, Serial No. 338,771
15 Claims. (Cl. 196—52)

1. A continuous process for the conversion of gaseous reactants in the presence of a moving mass of granular contact material maintained within a confined conversion zone, which comprises: gravitating at least 75 percent of the total granular contact material supply for said conversion zone into a mixing zone, supplying the total gaseous reactants to be supplied to said conversion zone to said mixing zone at a temperature at least 50° F. different from the temperature of the contact material supplied to the mixing zone and thoroughly mixing contact material and gaseous reactants in said mixing zone whereby the temperatures of substantially all of the contact material and substantially all of the reactant are brought within at least 50° F. of each other, passing contact material and reactant from the mixing zone downwardly through a plenum space and onto the surface of a substantially compact bed of contact material maintained within a confined conversion zone with upper surface at a level below the mixing zone, passing the reactant downwardly through said bed to effect the desired conversion, removing the products of conversion from said bed and removing contact material from the lower section of said bed.



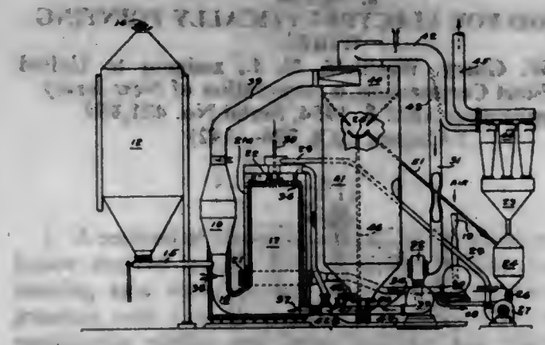
**2,773,017**

## INTEGRATED REFINING OF CRUDE OIL

Frank T. Barr, Summit, James W. Brown, Elizabeth, Harvey E. W. Burnside, Locust, and Charles E. Jahnig, Red Bank, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application August 5, 1952, Serial No. 302,646
6 Claims. (Cl. 196—52)

1. An integrated heavy oil refining process which comprises introducing an oil containing constituents vaporizable at atmospheric pressure into a fractional distillation zone operating at least at atmospheric pressure, removing and passing a gas oil fraction from said distillation zone to a fluid catalytic conversion zone, removing and passing a residual fraction boiling above about 800° F. from said distillation zone to a low-conversion zone wherein inert finely divided heat transfer solids are maintained as a fluid bed at a temperature in the range of 800 to 1100° F. and wherein said residual fraction is converted to coke and hydrocarbon vapors, directly passing the resulting hydrocarbon vapors without appreciable cooling to said fluid catalytic conversion zone wherein finely divided cracking catalyst is maintained as a fluid bed at a temperature in the range of 850 to 1100° F. and wherein said hydrocarbon vapors and gas oil fraction are converted into lower boiling catalytic conversion products, directly passing said lower boiling conversion products in vapor form from said catalytic conversion zone to said



distillation zone, recovering a catalytically cracked gasoline fraction from an upper part of said distillation zone, removing coke-containing catalyst from said catalytic conversion zone, burning coke deposits therefrom in a regeneration zone in the presence of an oxygen-containing gas, returning catalyst so regenerated to said catalytic conversion zone, and supplying heat to said low-conversion zone by heat exchange between catalyst withdrawn from said regeneration zone and said heat transfer solids.

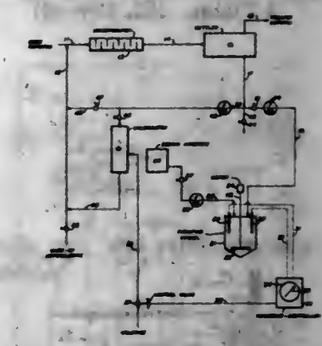
**2,773,018**

## CONTINUOUS PROCESS FOR DRYING, PREHEATING, AND DEVOLATILIZATION OF CARBONACEOUS MATERIALS

Vernon F. Parry, Wheatridge, Colo., assignor to the United States of America as represented by the Solicitor of the Department of the Interior

Application August 12, 1952, Serial No. 304,051
7 Claims. (Cl. 202—27)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. The process of drying, preheating and devolatilizing carbonaceous materials which comprises passing finely divided carbonaceous low rank coal particles entrained in a stream of hot gases flowing upwardly at relatively low velocity through the bottom of and upwardly through a drying and preheating zone, where the sensible heat in the gases is transferred to the carbonaceous particles and evaporates the moisture therefrom, and the particles are preheated to about 250°–300° F., passing said stream at increased velocity from said drying and preheating zone to a separating zone and there separating the dried carbonaceous particles from the moisture vapor and spent gases of said stream, passing the dried heated particles entrained in air upwardly through the bottom of and upwardly through a reaction zone while suddenly raising the temperature of the particles in said zone to a temperature in the range of about 850° to 1000° F. to form char, tar and process gases and withdrawing said char, tar and process gases through the top of said reaction zone.



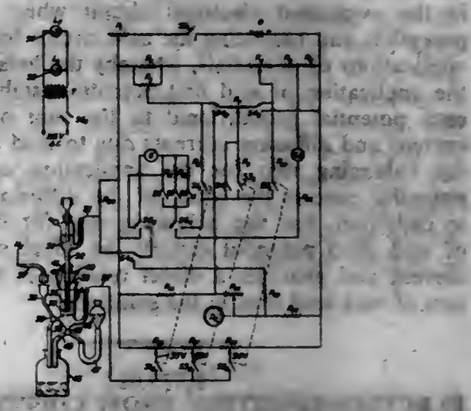
**2,773,019**

## CONTROL OF HYPOCHLORITE TREATING OPERATION

Mathis T. Waddell, Baytown, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

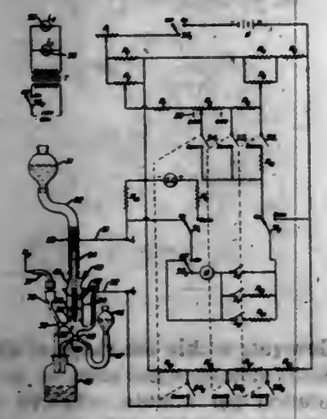
Application July 26, 1954, Serial No. 445,554
2 Claims. (Cl. 204—1)

1. A method operable in an analysis system comprising spaced electrodes and means for detecting a voltage generated therebetween for determining the available chlorine remaining in a spent aqueous alkaline hypochlorite solution utilized for the treatment of sour petroleum hydrocarbons, said hypochlorite solution containing from about 50 to 250 grams of sodium hydroxide per liter and from about 0.1 to 1.0 gram per liter of available chlorine, said method comprising the steps of continuously mixing an aqueous sodium meta-arsenite solution of fixed concentration and containing from about 0.2 to about 3.0 grams per liter of sodium meta-arsenite with said spent hypochlorite treating solution and flowing said mixture through said system in contact with said electrodes, said sodium meta-arsenite solution being admixed with said hypochlorite solution in an amount sufficient to provide a voltage within the range of about 0 to 200 millivolts at a flow rate within the range of about 0.5 to 5 volumes of sodium meta-arsenite solution per volume of hypochlorite solution per minute, whereby said voltage is a measure of the available chlorine content of said hypochlorite solution.



**2,773,020**

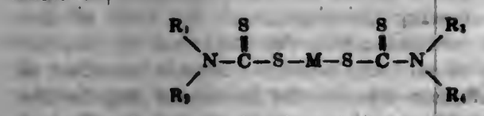
## METAL ION DETERMINATION BY DIRECT READING SYSTEM



Elmer Bradley Offutt, Independence, and Leonard V. Sorg, Kansas City, Mo., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

Application May 31, 1951, Serial No. 229,208
1 Claim. (Cl. 204—1)

In the method of polarographic analysis of aqueous solutions containing lead ions, the improvement which comprises segregating a measured quantity of such solution, adding a known proportion of cadmium ions to the aqueous solution under test, maintaining said solution of mixed ions between a dropping mercury electrode and a submerged electrode, applying in series a first potential of about 0.30 to 0.37 volt, a second potential of about 0.82 to 0.9 volt, and a third potential of about 0.57 to 0.60 volt, progressively stepwise across said electrodes, measuring the current flowing between said electrodes and in the associated electrical circuit when applying said potentials and balancing the said circuit for each of said applications of potentials, whereby the balancing step for the application of said first potential cancels the effect of the residual diffusion current, the balancing step for the application of said second potential cancels the effect of the cadmium diffusion current, and the balancing step for the application of said third potential provides a direct reading of the concentration of said lead ions in the solution.



2,773,021
**DIRECT READING SYSTEM FOR METAL ION DETERMINATION**
Elmer Bradley Offutt, Independence, and Leonard V. Sorg, Kansas City, Mo., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application November 28, 1952, Serial No. 323,104
1 Claim. (Cl. 204—1)

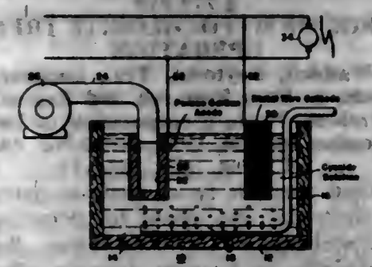
In the method of polarographic analysis of aqueous solutions containing lead ions, the improvement which comprises segregating a measured quantity of such solution, adding a known proportion of cadimum ions to the aqueous solution under test, maintaining said solution of mixed ions between a dropping mercury electrode and a submerged electrode, applying in series a first potential of about 0.82 to 0.90 volt, a second potential of about 0.57 to 0.60 volt, and a third potential of about 0.30 to 0.37 volt, progressively stepwise across said electrodes, measuring the current flowing between said electrodes and in the associated electrical circuit when applying said potentials and balancing the said circuit for each of said applications of potentials, whereby the balancing step for the application of said first potential establishes a reference potential proportional to the sum of the residual current and diffusion currents due to lead and cadmium, the balancing step for the application of said second potential cancels the effect of the diffusion current due to cadmium, and the balancing step for the application of said third potential cancels the effect of the residual current and provides a direct reading of the concentration of said lead ions in the solution.

2,773,022
**ELECTRODEPOSITION FROM COPPER ELECTROLYTES CONTAINING DITHIOCARBAMATE ADDITION AGENTS**
Dennis R. Turner, New Providence, N. J., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application August 17, 1953,
Serial No. 374,818
4 Claims. (Cl. 204—52)

1. An aqueous electroplating electrolyte for plating bright or semi-bright copper as the sole metal to be plated, the electrolyte comprising an aqueous solution of a copper salt having admixed therein from .0005 to 1.0 ounce per gallon of a brightening agent having the nucleus

where M is a metal selected from the group consisting of cadmium, cobalt, nickel, and zinc and $R_1$, $R_2$, $R_3$, $R_4$ are selected from at least one of the group consisting of monovalent hydrocarbon radicals containing from 1 to 6 carbon atoms.

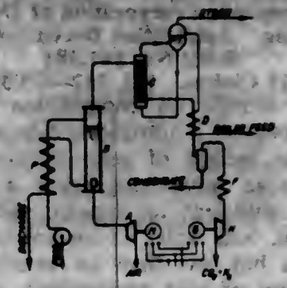
2,773,023
**REMOVAL OF OXYGEN FROM METALS**
Bertram C. Raynes and Merle E. Sibert, Euclid, Ohio, assignors, by mesne assignments, to Horizons Titanium Corporation, Princeton, N. J., a corporation of New Jersey
No Drawing. Application April 26, 1954,
Serial No. 425,768
2 Claims. (Cl. 204—140)



1. The method of removing oxygen from oxygen-containing metals of the group consisting of titanium and zirconium which comprises anodically electrolyzing said oxygen-containing metal at a cell voltage below about 2 volts in a fused halide salt electrolyte containing carrier ions of said metal, continuing the electrolysis until a substantial portion of the oxygen content of the anodic metal has been transported to the cathode and has thereby been removed from the anodic metal, and recovering the resulting deoxidized anodic metal.

2,773,024
**METHOD FOR ELECTROLYTICALLY POINTING WIRE**
Robert W. Gurry, Westfield, N. J., assignor to United States Steel Corporation, a corporation of New Jersey
Application April 8, 1954, Serial No. 421,859
2 Claims. (Cl. 204—142)

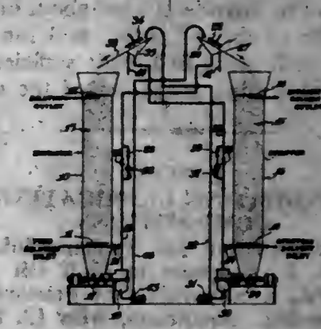
2. A method of forming a point on the end portion of a wire comprising housing the wire in a J-shaped impervious open-ended tube which is inert to electrolytic action, the tip of the wire terminating approximately even with the shorter arm of the tube, immersing the tube and wire in an electrolyte with the shorter arm of the tube and the end portion of the wire extending vertically upward and the tube housing the entire immersed portion of the wire allowing the electrolyte access to the wire only through the open end, and applying electric current to the wire as an anode and to a cathode surrounding the wire and tube.



2,773,025
**DESTROYING CYANIDES IN AQUEOUS CYANIDE SOLUTIONS**
Herbert E. Ricks and Warren M. Trigg, Pittsburgh, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application September 10, 1953, Serial No. 379,442
4 Claims. (Cl. 204—149)

1. In the process of rapidly reducing to a low concentration the cyanide content of an aqueous solution of a cyanide, the steps comprising disposing in the aqueous solution an inert cathode and an insoluble anode having porous walls, passing through the walls of the porous anode a gas containing free oxygen, the gas forming a stream of fine bubbles at the surface of the anode, and, simultaneously with the passage of the gas through the walls of the anode, passing a direct electrical current at a density of at least 5 amperes per square foot at the anode, the amount of the gas being sufficient to provide oxygen in an amount in substantial excess of that required to react with the cyanide to form relatively non-toxic products comprising essentially carbon dioxide, carbon monoxide, and nitrogen.

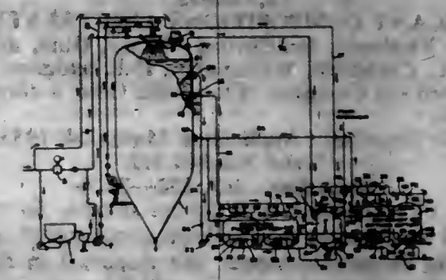
2,773,026
**REMOVAL OF DISSOLVED OR DISPERSED ORGANIC MATERIAL FROM AQUEOUS SOLUTIONS AND SUSPENSIONS**
Karl Nicolaus Cederquist, Falun, Sweden, assignor to Stora Kopparbergs Bergslags Aktiebolag, Falun, Sweden, a joint-stock company limited of Sweden
Application July 2, 1953, Serial No. 365,755
7 Claims. (Cl. 210—2)



1. A method of removing organic material from a waste liquor derived from a pulping process which comprises treating said waste liquor at elevated temperature and pressure with oxygen-containing gases in order to effect combustion within said liquor utilizing heat liberated in the combustion in order to carry out the pressure treatment, and allowing said combustion to continue at least to the stage at which substantially the remaining organic substance forms an insoluble carbonous residue in the liquor.

2,773,027
**HOLLOW CARBOXYMETHYL CELLULOSE BEAD AND METHOD FOR MAKING**
William Richards Powers, Penns Grove, N. J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application May 9, 1952,
Serial No. 287,049
17 Claims. (Cl. 210—8.5)

9. A process for the preparation of substantially spherical beads having an aqueous core within a surrounding envelope of a water-insoluble salt of carboxymethylcellulose which comprises introducing individual drops of an aqueous solution of water-soluble sodium carboxymethyl cellulose into an aqueous solution of a metal salt, said metal salt being selected from the group consisting of aluminum, titanium, chromium, iron, nickel, copper, zinc, zirconium, silver, tin and lead salts, and said aqueous solution of water-soluble carboxymethylcellulose having a concentration in the range of from about 1% to about 15%, by weight, of the cellulose ether.



2,773,028
**DIALYSIS PROCESS**
Gilbert P. Monet, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Application April 29, 1952, Serial No. 285,035
8 Claims. (Cl. 210—8.5)

1. A process for the separation of the dissolved components of a dialyzable solution comprising contacting said dialyzable solution with a dialytic separation medium in the form of a loose granular gel substantially inert chemically to said solution and to any substances dissolved in said solution, effecting transfer of at least part of the dialyzable components from said solution

into said granular gel, and removing said granular gel from said solution.

2,773,029
**WATER TREATING SYSTEM**
Joseph F. Schaid, Bloomfield, N. J., assignor to Worthington Corporation, Harrison, N. J., a corporation of Delaware
Application April 16, 1954, Serial No. 423,579
9 Claims. (Cl. 210—16)

1. The method of bringing the ion exchange type secondary softener battery of a precipitating type water softening system up to operating temperature which consists in simultaneously passing steam and water to a direct contact heater, recirculating the water through said heater to heat and to deaerate the water, delivering the preheated and deaerated water to said secondary softener battery to gradually heat the ion exchange material therein up to operating temperature, and passing the cooled water from said secondary softener battery to waste.

2,773,030
**DRILLING MUDS**
Rodolfo J. Taillour, San Tome, Venezuela, assignor to Gulf Oil Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application October 28, 1954, Serial No. 465,417
38 Claims. (Cl. 252—8.5)

1. A drilling mud of enhanced lubricating properties comprising an oil-in-water emulsion containing clay solids and a water-insoluble, oil-soluble sulfurized organic compound, said sulfurized compound being present in an amount sufficient to increase the Timken load-carrying capacity of the mud to at least about 30 pounds, said mud containing no amount of alkali metal hydroxide sufficient to destroy the enhanced lubricating properties of the mud.

2,773,031
**DRILLING MUDS**
Rodolfo J. Taillour, San Tome, Venezuela, assignor to Gulf Oil Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application October 28, 1954,
Serial No. 465,418
21 Claims. (Cl. 252—8.5)

1. A drilling mud of enhanced lubricating properties comprising an oil-in-water emulsion containing clay

solids, an asphalt in the oil phase, said asphalt having chemically combined sulfur and being present in an amount sufficient to provide at least about one percent of sulfur by weight of the oil phase, said mud containing no amount of alkali metal hydroxide sufficient to destroy the enhanced lubricating properties of the mud.

---

2,773,032
RUST INHIBITING LUBRICATING OIL COMPOSITIONS
Troy L. Cantrell, Drexel Hill, Pa., and John G. Peters, Audubon, N. J., assignors to Gulf Oil Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application May 13, 1954, Serial No. 429,686
1 Claim. (Cl. 252—32.5)

A composition comprising a major amount of a mineral lubricating oil, and about 0.024 percent by weight of the composition of dimerized linoleic acid, and about 0.016 percent by weight of the composition of a salt of a primary alkyl amine containing 8 to 18 carbon atoms per molecule and 3-methylbutyl, 2- ethylhexyl orthophosphate.

---

2,773,033
LUBRICANT COMPOSITIONS AND TREATMENT
John D. Bartleson, Beachwood Village, Ohio, and Margaret L. Christoph, Wilmington, Del., assignors to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio
No Drawing. Application March 24, 1953, Serial No. 344,462
20 Claims. (Cl. 252—32.7)

1. An oil-dispersible composition suitable for use as a lubricant additive comprising from about 0.01% to about 1% of an oil-soluble copper salt dispersed in the reaction product of a phosphorus sulfide-oxygen-containing organic compound-olefin polymer reaction product, the oxygen-containing organic compound being selected from the group consisting of those compounds containing hydroxy, carbonyl, ether and carboxy radicals, and having a boiling point of at least 225° F. with potassium hydroxide produced by reacting the last-mentioned reaction product with an amount of solid potassium hydroxide in excess of the amount required just to neutralize the reaction product within the range from over 125 equivalent up to about three equivalents per mole of the said reaction product at an elevated temperature at which the materials react for a time to complete the reaction and, separating insoluble materials from the reaction mixture to obtain an improved reaction product, and characterized by improved color, color stability and stability against liberation of hydrogen sulfide.

---

2,773,034
TREATMENT OF LUBRICANTS WITH POTASSIUM HYDROXIDE AND PRODUCTS
John D. Bartleson, Beachwood Village, Ohio, assignor to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio
No Drawing. Application February 17, 1953, Serial No. 337,446
16 Claims. (Cl. 252—32.7)

1. A process for improving the color, color stability and stability against liberation of hydrogen sulfide of phosphorus sulfide-oxygen-containing organic compound-olefin polymer reaction products, said oxygen-containing organic compound being selected from the group consisting of those compounds containing hydroxy, carbonyl, ether and carboxy radicals, and having a boiling point of at least 225° F. which comprises reacting the reaction product with an amount of solid potassium hydroxide in excess of the amount required just to neutralize the reaction product within the range from over 1.25 equivalent up to about three equivalents per mole of the reaction product at an elevated temperature at which the materials react for a time to complete the reaction and separating insoluble materials from the reaction mixture to obtain an improved reaction product.

5. As an oil-dispersible composition suitable for use as a lubricant additive the reaction product of a phosphorus sulfide-oxygen-containing organic compound-olefin polymer reaction product with solid potassium hydroxide produced by the process in accordance with claim 1 and characterized by improved color, color stability and stability against liberation of hydrogen sulfide.

---

2,773,035
SOLUBLE OIL COMPOSITIONS
Stanley P. Waugh, Westfield, N. J., assignor to Tidewater Oil Company, a corporation of Delaware
No Drawing. Application December 12, 1951, Serial No. 261,381
11 Claims. (Cl. 252—33.3)

1. A stable soluble oil composition comprising, in homogeneous solution, a lubricating base in major amount based upon the weight of said composition, a water soluble soap as an emulsifying agent, a coupling agent in an amount sufficient to disperse said soap in said lubricating base, and water in an amount sufficient to inhibit gelation but less than an amount sufficient to induce separation of said composition, said lubricating base comprising (*a*) a predominantly aromatic extract obtained by furfural extraction of a petroleum fraction and (*b*) a mineral oil fraction which has not been solvent extracted.

---

2,773,036
EXTREME PRESSURE SOLUBLE OIL COMPOSITIONS
Stanley P. Waugh, Westfield, N. J., assignor to Tidewater Oil Company, a corporation of Delaware
No Drawing. Application December 27, 1951, Serial No. 263,697
9 Claims. (Cl. 252—33.4)

1. A stable soluble oil composition comprising, in homogeneous solution, a lubricating base in major amount based upon the weight of the composition a predominantly aromatic extract obtained by furfural extraction of a mineral oil fraction, a water-soluble soap as an emulsifying agent, an extreme pressure agent, and water in an amount sufficient to inhibit said composition against gelation but less than an amount sufficient to induce separation of said composition.

---

2,773,037
CONCENTRATES USEFUL AS ADDITIVES IN MINERAL OIL COMPOSITIONS AND MINERAL OIL COMPOSITIONS CONTAINING SAME
John W. Bishop, Plainfield, N. J., assignor to Tidewater Oil Company, a corporation of Delaware
No Drawing. Application March 27, 1953, Serial No. 345,221
4 Claims. (Cl. 252—46.6)

1. A lubricating composition comprising a mineral oil in major amount based upon the weight of said composition and a small amount, sufficient to impart anti-oxidant and anti-corrosion properties to said composition, of an oil-soluble phosphorus- and sulfur-containing reaction product of (*a*) an alkyl ester of an acid from the group consisting of propenoic acid and alkyl-substituted propenoic acids with (*b*) an acidic, phosphorus- and sulfur-containing product of reaction between an excess of a phosphorus sulfide and a predominantly aromatic extract obtained by furfural extraction of a mineral oil.

2,773,038
LUBRICANTS
William B. Whitney and William N. Axe, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application November 20, 1951, Serial No. 257,410
18 Claims. (Cl. 252—48.8)

2. A lubricating oil composition comprising a mineral oil having a viscosity index of at least 50 and containing an amount sufficient to impart anticorrosion properties thereto, of a product of sulfurization of a diarylalkane containing from 4 to 12 alkane carbon atoms, obtained when employing sulfur monochloride as the sulfurizing agent.

---

2,773,039
MAGNETICALLY STRONG FERROMAGNETIC MAGNESIUM-ZINC TYPE OF FERRITE
Ernst Albers Schoenberg, Metuchen, N. J., assignor to Steatite Research Corporation, Keasbey, N. J., a corporation of Delaware
No Drawing. Application November 24, 1952, Serial No. 322,339
1 Claim. (Cl. 252—62.5)

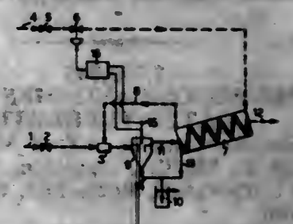
A fired ferromagnetic body of high permeability properties and having a Curie point above 120° C. consisting essentially of the following ingredients in the proportions indicated:

| | Mol percent |
|---|---|
| MgO | 8–25 |
| ZnO | 25–14 |
| CuO | 2–11 |
| NiO | 3–12 |
| $Li_2O$ | 0–3 |
| $Fe_2O_3$ | 47.4–52.4 |

---

2,773,040
HEAT-PRODUCING COMPOSITIONS
George Walton, Sharonville, Ohio, assignor to The Drackett Company, Cincinnati, Ohio, a corporation of Ohio
No Drawing. Application May 19, 1953, Serial No. 356,091
3 Claims. (Cl. 252—157)

1. A composition liberating heat when added to water, comprising, in admixture in substantially dry and divided form, and as discrete particles, from about 2% to about 8% aluminum by weight of the composition, and an alkali metal hydroxide in an amount at least twice the theoretical amount required for combination with the aluminum, the aluminum being in the form of particles of substantially uniform size averaging from about 150 to about 350 particles per gram.



---

2,773,041
DEFOAMING COMPOSITION
Rudolph H. Larsen, Oakland, and Shek Ying Lam, San Francisco, Calif., assignors to Fred Bresee, Jr., doing business as Balab, Oakland, Calif.
No Drawing. Application July 16, 1951, Serial No. 237,076
1 Claim. (Cl. 252—358)

A composition having defoaming properties comprising from 50–70% by weight of kerosene; 10–15% by weight of stearic acid; from 2 to 6% by weight of a poly-oxyethylene ester of tall oil; from 5 to 10% by weight of a deflocculated, finely-divided compound selected from the group consisting of alumina hydrate and magnesium carbonate; from 1 to 5% by weight of monoethanolamine; and from 10 to 30% by weight of water, the composition being substantially free of metallic soap and containing the reaction product formed by the reaction of the fatty acid with the organic base, the composition being in the form of an oil-water emulsion and exhibiting marked immediate and sustained defoaming action when added to latices normally susceptible to foaming.

---

2,773,042
PROCESS OF AND APPARATUS FOR REGULATING THE COMPOSITION OF VAPOR-GAS MIXTURES
Petrus F. A. M. Hendrikx, Sittard, Netherlands, assignor to Stamicarbon N. V., Heerlen, Netherlands
Application December 4, 1953, Serial No. 396,163
Claims priority, application Netherlands December 12, 1952
2 Claims. (Cl. 252—372)

1. Process of regulating the composition of steam-oxygen containing gas mixtures comprising the steps of separately supplying steam and gas, saturating the steam by cooling, mixing the saturated steam with the gas, the temperature of the gas being such that the resultant mixture is steam saturated, removing water condensate from said mixture, detecting the temperature of said saturated steam-gas mixture, controlling the rate of steam supply in accordance with said detected temperature, and subsequently reheating the steam-gas mixture with the heat which has been removed in saturating the steam.

---

2,773,043
RESINOUS COMPOSITIONS COMPRISING THERMOSETTING EPOXIDE RESINS AND THERMOPLASTIC POLYVINYL RESINS AND BENTONITE-AMINE REACTION PRODUCTS
Florian J. Zakas, Forest Hills, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application September 28, 1954, Serial No. 458,989
8 Claims. (Cl. 260—3.3)

1. A hardenable, normally liquid resinous composition comprising from 20 to 80 parts by weight of a thermosetting resin comprising a glycidyl polyether of a polyhydric phenol having a 1,2-epoxy equivalency of between 1 and 2 and which is devoid of other reactive substituents than phenolic hydroxyl groups, and an insoluble catalyst therefor, the catalyst being present in an amount of from 6% to 50% by weight based on 100 parts by weight of the glycidyl polyether, from 80 to 20 parts by weight of a thermoplastic resin comprising a plastisol including a resin selected from the group consisting of non-volatile halogen-containing high molecular weight vinylidene polymers, halogenated paraffin waxes, and halogenated natural rubber and a plasticizer therefor, and a bentonite-amine reaction product in an amount sufficient to maintain the catalyst in suspension in the liquid resins whereby the composition may be converted to a homogeneous solid having excellent flexibility characteristics and impact resistance.

---

2,773,044
PIGMENTED ORGANIC PLASTICS AND METHOD FOR PREPARING THE SAME
Vincent C. Vesce, Smoke Rise, Kinnelon, N. J., assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
No Drawing. Application June 2, 1953, Serial No. 359,222
14 Claims. (Cl. 260—22)

1. A process of dispersing pigment in an alkyd resin plastic which comprises milling pigment and alkyd resin

plastic in a liquid grinding medium comprising water and a liquid organic water-miscible solvent in which the alkyd resin plastic is at least partially soluble, the water and solvent being present throughout the milling operation in such proportions that the liquid gringing medium does not dissolve a substantial amount of the alkyd resin plastic and does not cause substantial agglomeration of the alkyd resin plastic, the liquid grinding medium being present at all times in such amounts as to give a fluidity to the mixture which permits effective milling action, continuing the milling action until a dispersion of pigment in alkyd resin plastic is obtained, and thereafter separating the solid portion from the liquid portion of the milled mixture.

2,773,045

## WAX COMPOSITIONS AND SHEET MATERIALS COATED THEREWITH

Linton E. Sinecri, Menasha, Alfred M. Heald, Neenah, and George P. Mueller, Appleton, Wis., assignors to Marathon Corporation, Rothschild, Wis., a corporation of Wisconsin

No Drawing. Application February 20, 1951, Serial No. 211,968
10 Claims. (Cl. 260—28.5)

1. A heat-sealable sheet material comprising a fibrous paper base sheet having a superficial coating comprising a solid polymer of ethylene and isopropanol having the formula

wherein $R_1$ and $R_2$ are methyl groups and $R_3$ is a $CH_3—(C_2H_4)_n$ group where the average value for $n$ is in the range of about 60 to 100, said polymer being present in amounts from .25% to 5% by weight and having a molecular weight in the range of from 500 to about 3000 and having a melting point of from about 210° F. to about 240° F., 1% to 5% by weight of solid polyethylene, and 75% to about 98.75% of petroleum wax having a melting point of from about 130° F. to about 170° F.

---

2,773,047

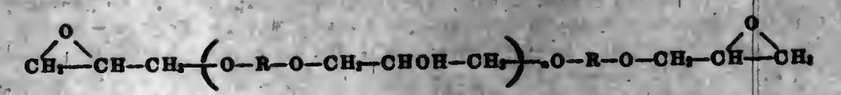
## PREPARATION OF SPINNABLE SOLUTIONS OF POLYACRYLONITRILE AND RELATED POLYMERIZATES

Ernst Pirot, Erkenbrech (Rhein), and Eduard Hantelmann, Aachen, Germany, assignors to Vereinigte Glanzstoff-Fabriken A. G., Wuppertal-Elberfeld, Germany, a corporation of Germany

Application November 17, 1954, Serial No. 469,495
Claims priority, application Germany November 21, 1953
2 Claims. (Cl. 260—32.6)

1. Method of preparing a solution of polyacrylonitrile for spinning which comprises maintaining a solution of polyacrylonitrile in dimethylformamide in the boiling state under reflux at a pressure of 100 mm. Hg, continuously introducing a stream of a cold dispersion of polyacrylonitrile in dimethylformamide and simultaneously withdrawing and filtering the same to obtain a filtrate for spinning.

---



2,773,048

## EPOXY RESIN COMPOSITION CONTAINING PARA, PARA' DIAMINO DIPHENYLMETHANE

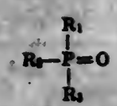
Jerome L. Ferme, Lionel H. Le Gault, Luther L. Belstad, and Arthur D. Stuning, Minneapolis, Minn., assignors to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Minnesota

No Drawing. Application August 25, 1952, Serial No. 306,306
21 Claims. (Cl. 260—37)

1. A composition of matter comprising para, para' diamino diphenylmethane together with an epoxy resin having the structural formula

wherein R stands for the hydrocarbon radical of a dihydric phenol and $n$ stands for a number ranging from more than 0 up to about 20, the said diamino compound being commingled with said epoxy resin in an amount ranging from ½ to 30% by weight of said resin.

---



2,773,046

## VINYL RESIN PLASTICIZED WITH A POLYHALOPHENYL PHOSPHATE

James H. Dunn and Paul E. Weimer, Baton Rouge, La., assignors to Ethyl Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 3, 1953, Serial No. 396,058
6 Claims. (Cl. 260—30.6)

1. A plastic alloy comprising an ethylenic polymer selected from the group consisting of polyvinyl chloride, polystyrene, polymethyl methacrylate, polyvinylidene chloride and polyvinyl acetate and a compound having the general formula:

wherein $R_1$ and $R_2$ are halophenoxy radicals having between 3 and 5 nuclear substituted halogen atoms and $R_3$ is a radical selected from the group consisting of OH and a halophenoxy radical having between 3 and 5 nuclear substituted halogen atoms, said halophenoxy radicals having the combined total of at least eight halogen atoms, said halogen atoms being selected from the group consisting of chlorine and bromine.

---

2,773,049

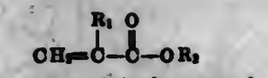
## SALICYLIC ACID ESTER AS COLOR INHIBITOR FOR POLYESTER-MONOMER RESINS

Merle Cowee, Milwaukee, Wis., assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa., a corporation of Pennsylvania

No Drawing. Application December 7, 1953, Serial No. 396,737
8 Claims. (Cl. 260—45.4)

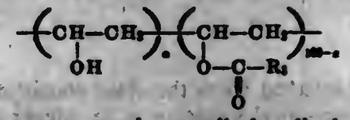
1. A hard resinous product having a high color stability and comprising an interpolymer of (A) a polyester of a dihydric alcohol and an alpha-beta ethylenic dicarboxylic acid (B) a monomer containing a >C=CH₂ group and (C) an ester of salicylic acid said ester being incorporated in the interpolymer.

---



2,773,050

## WATER VAPOR PERMEABLE COMPOSITIONS AND ARTICLES CONTAINING A POLYACRYLIC ESTER AND POLYVINYL ALCOHOL



John E. Caldwell and Russell Gilley, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application April 30, 1952, Serial No. 285,316
13 Claims. (Cl. 260—45.5)

3. A process for preparing a synthetic resinous composition which resists the passage of liquid water but permits transmission of water vapor comprising (A) polymerizing in an aqueous medium at a temperature of from about 45° C. to about 120° C. in the presence of a water-soluble peroxide polymerization catalyst (*a*) from about 25 to about 80 parts by weight of an ethylenically unsaturated polymerizable material wherein all carboxy groups are esterified and which consists of at least 50 mole percent of at least one acrylic ester having the formula:

wherein $R_1$ represents a substituent selected from the group consisting of a hydrogen atom and a lower alkyl radical containing from 1 to 4 carbon atoms and $R_2$ represents an alkyl radical containing from 1 to 6 carbon atoms, (*b*) while in admixture with from about 75 to about 20 parts by weight of a vinyl polymer having hydroxy radicals which can be depicted as follows:

wherein $R_3$ represents a lower alkyl radical, $x$ represents the percentage of this polymer having groups based on vinyl alcohol and 100—$x$ represents the percentage based on a lower alkaloic acid ester of vinyl alcohol, the numerical value of $x$ being from about 80 to 100, (B) and adding from about 1 to about 10% (based on the weight of the polyvinyl alcohol content) of a hardening and cross-linking agent for the polyvinyl alcohol content of the resin.

---

2,773,051

## PREPARATION OF RESINS FROM $C_5$ FRACTIONS AND CYCLOPENTADIENE DIMERS

Robert F. Leary, Cranford, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application July 3, 1953, Serial No. 366,061
2 Claims. (Cl. 260—82)

1. A process for preparing soluble petroleum resins which comprises blending a $C_5$ steam-cracked petroleum fraction relatively free of cyclopentadienes and dimers thereof and isoprene and boiling up to 38° C. with from 10–50 wt. percent of cyclopentadiene dimers, subjecting the resulting blend to polymerization at temperatures of from —20 to +90° C. in the presence of aluminum halide and isolating the resin produced thereby.

---

2,773,052

## COPOLYMERS OF PROPENYLBENZENE

Lester S. Cohen, Albert P. Giraitis, and Joseph R. Zietz, Jr., Baton Rouge, La., assignors to Ethyl Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application July 1, 1953, Serial No. 365,534
5 Claims. (Cl. 260—88.1)

1. A copolymer of propenylbenzene and another polymerizable monomer selected from the group consisting of isobutylene and styrene, said copolymer being formed at a temperature between about —190° C. and 150° C. and in the presence of a Friedel-Crafts catalyst selected from the group consisting of boron trifluoride and a mixture of an aluminum halide and the corresponding halide acid, said propenylbenzene being present in said copolymer in a concentration of from about 2 to about 97 percent by weight, the balance of said copolymer being said polymerizable monomer.

---

2,773,053

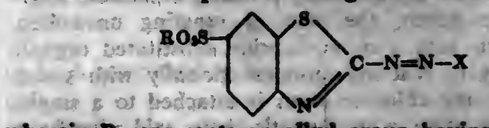
## ETHYLENE POLYMERIZATION WITH CATALYST OF GROUP VA METAL OXIDE AND ALKALINE EARTH HYDRIDE

Edmund Field, Chicago, and Morris Feller, Park Forest, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application July 22, 1953, Serial No. 369,723
15 Claims. (Cl. 260—94.9)

1. In a process for the production of a polymer having a molecular weight of at least about 300, the steps of contacting ethylene at a reaction temperature between about 75° C. and about 325° C. with an alkaline earth metal hydride and a catalyst prepared by treating a Group VA metal pentoxide supported upon a difficultly reducible metal oxide with a reducing gas at a temperature between about 350° C. and about 850° C. to produce a catalyst containing a lower-valent Group VA metal oxide, and separating a polymer having a molecular weight of at least about 300 thus produced.

---



2,773,054

## 6-ALKYLSULFONYLBENZOTHIAZOLE AZO COMPOUNDS

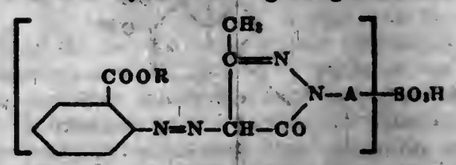
James M. Straley and David J. Wallace, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application August 14, 1953, Serial No. 374,414
10 Claims. (Cl. 260—155)

1. The azo compounds having the formula:

wherein R represents an alkyl group having 1 to 4 carbon atoms and X represents a member selected from the group consisting of a 1-alkyl-1,2,3,4-tetrahydroquinoline nucleus joined through the carbon atom in its 6-position to the azo bond shown, a 1-hydroxyalkyl-1,2,3,4-tetrahydroquinoline nucleus joined through the carbon atom in its 6-position to the azo bond shown, a 1,2,3,4-tetrahydrobenzo(h)quinoline nucleus joined through the carbon atom in its 6-position to the azo bond shown, a 1-alkylaminonaphthalene nucleus joined through the carbon atom in its 4-position to the azo bond shown and a 1-hydroxyalkylaminonaphthalene nucleus joined through the carbon atom in its 4-position to the azo bond shown.

---



2,773,055

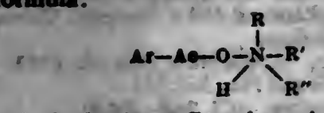
## YELLOW MONOAZO DYESTUFFS

Peter Hindermann, Betterle, Basel, and Jean-Pierre Jung, Rieben, near Basel, Switzerland, assignors to J. R. Geigy A. G., Basel, Switzerland, a Swiss firm

No Drawing. Application February 24, 1953, Serial No. 338,586
Claims priority, application Switzerland March 5, 1952
7 Claims. (Cl. 260—163)

1. A monoazo dyestuff having the general formula:

wherein R represents an aliphatic hydrocarbon radical of 8–12 carbon atoms and A represents a member selected from the group consisting of aromatic radicals of the benzene and naphthalene series.



2,773,056

## STABLE FINELY DIVIDED ALKYL AMINE DYES

Bertram M. Haffner, Hasbrouck Heights, N. Y., assignor to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York

No Drawing. Application July 12, 1952, Serial No. 298,625
3 Claims. (Cl. 260—208)

1. A dry free-flowing particulate dyestuff consisting of an organic amine non-hygroscopic salt having the following formula:

in which Ar is the dyestuff nucleus, Ac is from the group consisting of —CO—, and —$SO_2$—, and is joined directly to an aromatic carbon of the dyestuff, R and R′ are each an alkyl radical containing from 4 to 20 carbon atoms, and R″ is from the group consisting of hydrogen and an alkyl radical containing from 4 to 20 carbon atoms admixed with 1 to 25 parts per 100 parts by weight of said salt, of activated silica gel having a surface area of at least 100 square meters per gram, an oil absorption value of at least 100, and having an average particle size of from 0.01 to 50 microns.

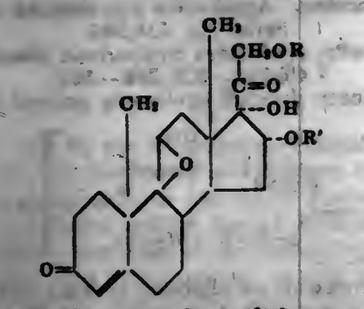
2,773,057

## METHOD OF PREPARING STARCH ETHER DERIVATIVES AND NEW STARCH ETHER DERIVATIVES PRODUCED THEREBY

Erling T. Hjermstad and Carl C. Kesler, Cedar Rapids, Iowa, assignors to Penick & Ford, Ltd., Incorporated, Cedar Rapids, Iowa, a corporation of Delaware

No Drawing. Application February 28, 1952, Serial No. 272,712
10 Claims. (Cl. 260—233.3)

1. In a method of producing partially etherified, filterable, granule starch, the step of reacting unswollen, granule starch with a monochlorine substituted organic etherifying agent reacting monofunctionally with starch and in which the chlorine atom is attached to a single-bonded carbon atom in an aliphatic chain, said etherifying agent being free of hydroxyl and epoxy groups, said reaction being carried out in an alkaline aqueous reaction medium in the presence of a sufficient amount of an alkali metal salt capable of inhibiting gelatinization of starch so that said starch remains filterable during the course of said reaction, said alkali metal salt being selected from the group consisting of sodium, potassium, and lithium, chlorides, carbonates, acetates, nitrates and sulfates.



2,773,058

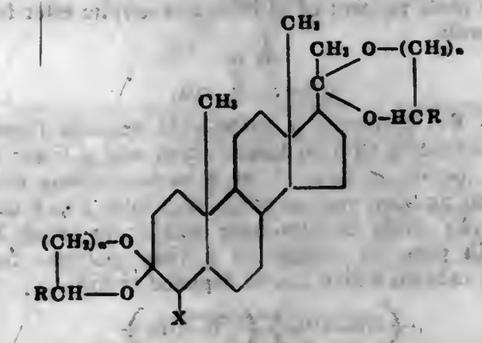
## $\Delta^4$-PREGNENES

Seymour Bernstein, Pearl River, N. Y., and Robert Herman Lenhard, Ridgefield Park, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application June 30, 1955, Serial No. 519,248
3 Claims. (Cl. 260—239.55)

1. A compound selected from those having the general formula:

in which R and R′ are members of the group consisting of hydrogen and lower alkanoyl radicals.



2,773,059

## STEROID α-HALO KETALS

Barney J. Magerlein and A Vern McIntosh, Jr., Kalamazoo, and Robert H. Levin, Kalamazoo Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application August 16, 1952, Serial No. 304,852
21 Claims. (Cl. 260—239.55)

1. A process for the production of a steroid 4-halo-3, 20-dione 3-cyclic monoketal which comprises: mixing together an acid hydrolyzing agent and a steroid 4-halo-3, 20-dione, 3,20-cyclic diketal having the following basic general formula:

wherein R is selected from the class consisting of hydrogen and a lower-alkyl group, *n* is an integer from one to two, and X is a halogen of atomic weight from 35 to 80, to cause selective hydrolysis of the 20-cyclic ketal group to form a 20-ketone group.

2,773,060

## STEROID KETALS

Robert H. Levin, Kalamazoo Township, Kalamazoo County, and Barney J. Magerlein and A Vern McIntosh, Jr., Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application August 16, 1952, Serial No. 304,851
22 Claims. (Cl. 260—239.55)

20. 4-chloropregnane-3,20-dione 3,20-ethylene glycol diketal.

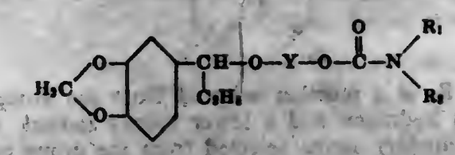
2,773,061

## PROCESS OF MAKING 4-(p-AMINOBENZENE-SULPHONYL) AMINO-PYRIMIDINES

Werner Loop, Hamburg-Lockstedt, Germany

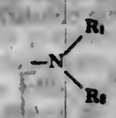
No Drawing. Application May 22, 1953, Serial No. 356,897
Claims priority, application Germany June 15, 1949
2 Claims. (Cl. 260—239.75)

2. A method of manufacturing 4-(p-aminobenzene-sulfonyl)-amino-2,6-dimethylpyrimidine, comprising the steps of reacting one mol of dry 4-amino-2,6-dimethyl-pyrimidine with about two mols of dry p-acetylsulphanilic acid chloride in the presence of an organic solvent free of hydroxyl groups and in the further presence of about two mols of trimethylamine, thereby forming a reaction product; and subjecting said reaction product to hydrolysis.



2,773,062

## ORGANIC COMPOUNDS AND INSECTICIDAL COMPOSITIONS



Edward A. Prill, Yonkers, N. Y., assignor to Boyce Thompson Institute for Plant Research, Inc., a corporation of New York

No Drawing. Application October 6, 1953, Serial No. 384,523
4 Claims. (Cl. 260—247.2)

1. The compound represented by the formula

wherein Y is a member of the group consisting of divalent alkylene radicals containing from 2 to 6 carbon atoms and divalent alkylene radicals containing from 2 to 6 carbon atoms which are interrupted by an ethereal oxygen atom, $R_1$ and $R_2$ are selected from the group consisting of the following elements: The hydrogen atom, monovalent alkyl radicals having 1 to 20 carbon atoms, monovalent hydrocarbon cycloalkyl radicals having not more than six carbon atoms in a cyclic ring and having not more than 20 carbon atoms in the radical, monovalent alkoxyalkyl radicals having not more than 12 carbon atoms, the phenyl radical, monovalent aralkyl radicals having 7 to 10 carbon atoms, the furfuryl radical wherein not more than one of $R_1$ and $R_2$ is the furfuryl radical, the tetrahydrofurfuryl radical wherein not more than one of $R_1$ and $R_2$ is the tetrahydrofurfuryl radical, not more than one of $R_1$ and $R_2$ being hydrogen, and elements which form, with the nitrogen atom of

to which they are attached, the piperidino radical, the morpholino radical, the 2-methylpiperidino radical, the 5-ethyl-2 methylpiperidino radical, and the pyrrolidino radical.

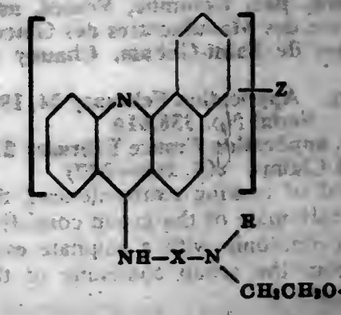
2,773,063

## PREPARATION OF ACRYLAMIDES

Edward H. Specht, Huntingdon Valley, Andrew Neuman, North Hills, and Harry T. Neher, Bristol, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application January 29, 1954, Serial No. 407,174
18 Claims. (Cl. 260—247.2)

1. A process for preparing acrylamides which comprises first reacting together at a temperature between 20° and 100° C. acetylene, nickel carbonyl, an organic carboxylic acid RCOOH where R is an aliphatic hydrocarbon group of not over three carbon atoms, and a basic nitrogen compound having hydrogen on the amino nitrogen thereof, and while these are reacting, introducing carbon monoxide into the reaction mixture and their reacting it at a reacting temperature between 20° and 100° C.



2,773,064

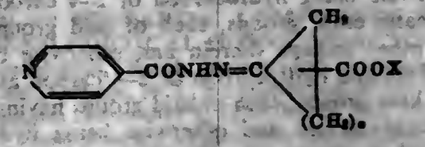
## 7-SUBSTITUTED AMINO-BENZ [c] ACRIDINES AND SALTS THEREOF

Edward F. Elslager, Harper Woods, Franklin W. Short, St. Clair Shores, and Marie-Jo Sullivan, Grosse Pointe Woods, Mich., assignors to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan

No Drawing. Application December 2, 1953, Serial No. 395,830
9 Claims. (Cl. 260—279)

1. A compound of the class consisting of a free base and its acid addition salts, said free base having the formula,

where Z is a member of the group consisting of hydrogen, halogen, alkyl and alkoxy radicals, said alkyl and alkoxy radicals containing not more than 2 carbon atoms; X is a divalent alkyl group containing from 2 to 5 carbon atoms; R is a member of the group consisting of hydrogen and lower alkyl radicals and lower hydroxyalkyl radicals and acyl derivatives thereof having the formula alkylene·O·Acyl; and Acyl is an aliphatic carboxylic acid acyl residue containing from 2 to 18 carbon atoms.



2,773,065

## CYCLOALKANONECARBOXYLIC ACID ISONICOTINYLHYDRAZONES AND THEIR SALTS

Gino Carrara, Milan, Italy, assignor to Lepetit S. p. A., Milan, Italy

No Drawing. Application October 13, 1953, Serial No. 385,886
Claims priority, application Italy October 23, 1952
3 Claims. (Cl. 260—295)

1. A compound of the formula

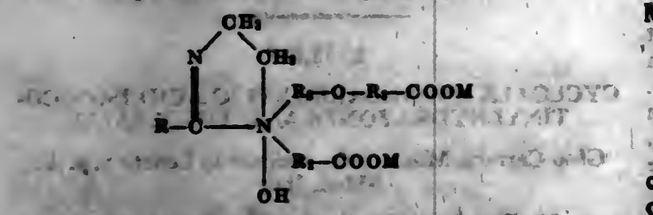
wherein X is a member of the group consisting of hydrogen and non-toxic alkali and alkaline earth metals, and *n* is an integer from 3 to 4.

2,773,066

## PROCESS FOR PRODUCING POLY-PYRIDYLS

Robert H. Linnell, Winston-Salem, N. C., and Antoine B. Zahlan, Syracuse, N. Y., assignors to Research Corporation, New York, N. Y., a corporation of New York

No Drawing. Application November 19, 1953, Serial No. 393,234
4 Claims. (Cl. 260—296)

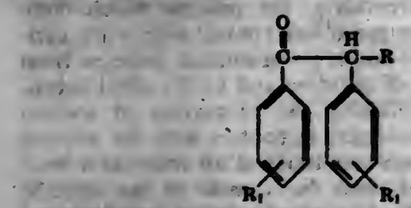


1. In making polypyridyls, the process which comprises bringing sodium metal into contact with a dry pyridine in which a 2 position is unsubstituted, selected from the group consisting of pyridine and $C_1$–$C_4$ alkyl substituted pyridines, maintaining the proportion of sodium metal in unreacted condition in contact with the selected pyridine under reaction conditions at all times at a level not above about 0.01 mole for 1 mole of the selected pyridine, warming the sodium and selected pyridine until reaction between them is substantially complete, oxidizing the thus reacted mixture, this oxidation producing polypyridyls and sodium hydroxide and leaving an unreacted pyridine, and then separating the polypyridyls from the said pyridine and sodium hydroxide.

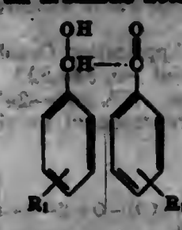
2,773,667
PREPARATION OF OXAZOLIDONES-2
Marcel Jean Viard, Bois Colombe, France, assignor to Societe Anonyme des Manufactures des Glaces et Produits Chimiques de Saint-Gobain, Chauny et Cirey, Paris, France
No Drawing. Application February 24, 1953, Serial No. 338,614
Claims priority, application France February 25, 1952
16 Claims. (Cl. 260—307)

14. The method of making oxazolidones-2 that comprises reacting a carbonate of the group consisting of the alkali metals and ammonia with a sulphate ester of an ethanol amine from the group consisting of the alkali metals and ammonia.

2,773,668
SUBSTITUTION DERIVATIVES OF IMIDAZOLINE ALKANOIC QUATERNARY AMMONIUM HYDROXIDE AND PROCESS OF PREPARING SAME
Hans S. Mannheimer, New York, N. Y.
No Drawing. Application July 11, 1955, Serial No. 521,393
8 Claims. (Cl. 260—309.6)



1. A compound of the following formula:



in which R is a hydrocarbon radical of 4 to 18 carbon atoms, $R_2$ and $R_3$ are selected from the group consisting of (*a*) aliphatic hydrocarbon groups of 1–4 carbon atoms, (*b*) hydroxy substituted aliphatic hydrocarbon groups of 1–4 carbon atoms, (*c*) aliphatic ether groups, each of said group having a single ether linkage therein and otherwise being hydrocarbon of 2–4 carbon atoms, (*d*) aliphatic ether groups, each of said groups having a single ether linkage therein and otherwise being hydroxy substituted hydrocarbon of 2–4 carbon atoms, (*e*) aliphatic keto groups, each of said groups having a single keto linkage therein and otherwise being hydrocarbon of 2–4 carbon atoms, (*f*) aliphatic keto groups, each of said groups having a single keto linkage therein and otherwise being hydroxy substituted hydrocarbon of 2–4 carbon atoms, and M is an alkali metal.

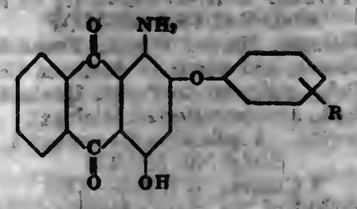
2,773,669
AMINES
Richard V. Heinzelman, Kalamazoo Township, Kalamazoo County, and Brooks D. Aspergren, Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan
No Drawing. Application November 12, 1952, Serial No. 320,125
10 Claims. (Cl. 260—326.5)

1. A process for the preparation of tertiary N-desylamines of the formula:

wherein R is a tertiary cyclic amino radical selected from the group consisting of pyrrolidino, piperidino, morpholino, decahydroquinolino radicals, and lower-alkyl substituted pyrrolidino, piperidino, morpholino and decahydroquinolino radicals and $R_1$ is a member selected from the group consisting of hydrogen and a lower alkoxy radical, which includes the step of reacting at an elevated temperature and in the presence of an acidic condensing agent, an aromatic ketone of the formula:

wherein $R_1$ is a member selected from the group consisting of hydrogen and a lower alkoxy radical, with a cyclic secondary amine selected from the group consisting of pyrrolidine, piperidine, morpholine, decahydroquinoline, and lower-alkyl substituted pyrrolidines, piperidines, morpholines and decahydroquinolines, to obtain the corresponding desired tertiary N-desylamine.

2,773,670
CATALYTIC PROCESS FOR PRODUCING ALKYLENE CARBONATES
Myril Lichtenwalter, Austin, and Justin F. Cooper, Port Arthur, Tex., assignors to Jefferson Chemical Company, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application October 31, 1952, Serial No. 318,682
13 Claims. (Cl. 260—340.2)



1. The process of preparing alkylene carbonates which comprises reacting an alkylene oxide with a molar excess of carbon dioxide at a temperature between 100 and 225° C. and a pressure in excess of 300 pounds per square inch gauge in the presence of an ammonium halide catalyst selected from the group consisting of (*a*) compounds having the formula

in which X is an ion selected from the group consisting of fluoride, chloride, bromide and iodide, and $R_1$, $R_2$, $R_3$, and $R_4$ are each radicals selected from the group consisting of (1) hydrogen, (2) alkyl containing from 1 to 20 carbon atoms, (3) phenyl, (4) lower alkenyl (5) alkylphenyl in which the alkyl group contains from 1 to 4 carbon atoms, and (6) phenyl-substituted alkyl radicals in which the alkyl group contains from 1 to 4 carbon atoms, and (*b*) compounds having the above noted formula in which $R_1$ and $R_2$ have the values above noted, and in which $R_3$ and $R_4$ are interconnected to form with the basic nitrogen atom a heterocyclic ring selected from the group consisting of the pyridine, piperidine, pyrrolidine, pyrroline, morpholine, and thiomorpholine series.

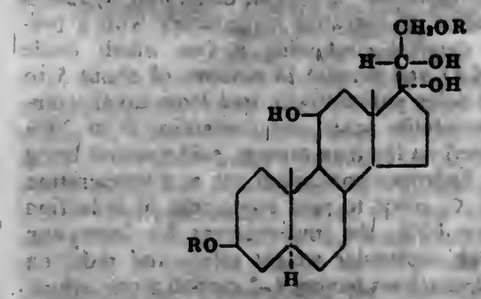
2,773,671
ANTHRAQUINONE DYES
Roy A. Pizzarello, Mount Vernon, and Boris Gutoff, Far Rockaway, N. Y., assignors to Interchemical Corporation, New York, N. Y., a corporation of Ohio
No Drawing. Application January 26, 1954, Serial No. 406,332
6 Claims. (Cl. 260—380)

1. A new red dye having the structural formula:

wherein R is a member of group consisting of hydroxyl

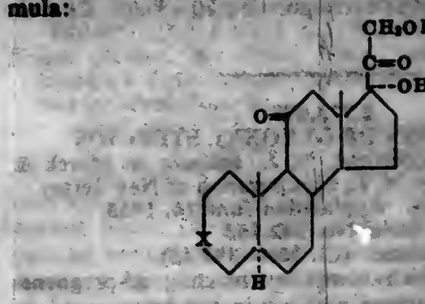
group, an alkoxy group containing one to four carbon atoms, an hydroxy alkyl group containing one to four carbon atoms, and an hydroxyalkoxy group containing two to four carbon atoms.

2,773,672
STEROID HYDROLYSIS
Milton E. Herr, Kalamazoo Township, Kalamazoo County, and Frederick W. Heyl, Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan
No Drawing. Application June 17, 1953, Serial No. 362,404
8 Claims. (Cl. 260—397.3)



1. A process for the production of a 3-keto steroid selected from cholestane and pregnane compounds which comprises: mixing a 3-tertiary amino steroid selected from cholestene and pregnene compounds, having an unconjugated double bond alpha to the amino nitrogen atom, with an essentially neutral organic solvent containing water to produce a secondary amine and said 3-keto steroid compound.

2,773,673
CYCLOPENTANOPHENANTHRENE COMPOUNDS AND METHOD FOR PREPARATION THEREOF
George Rosenkranz, Mexico City, Mexico, and Carl Djerassi, Birmingham, Mich., assignors, by mesne assignments, to Syntex S. A., Mexico City, Mexico, a corporation of Mexico
No Drawing. Application September 22, 1952, Serial No. 310,934
Claims priority, application Mexico October 8, 1951
3 Claims. (Cl. 260—397.3)

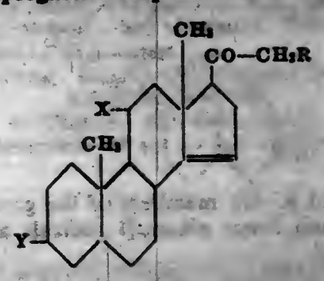


1. A method for the preparation of pregnane-3,11,20-trione compounds, which comprises treating spirostan-3,11-dione compounds with acetic anhydride under pressure and at a temperature of approximately 200° C., thereafter oxidizing the $\Delta^{20(22)}$-furostene-26-ol-3,11-dione acetate formed with chromic anhydride followed by hydrolysis with alumina to produce the corresponding $\Delta^{14}$-pregnene compound, and thereafter hydrogenating the $\Delta^{14}$-pregnene-3,11,20-trione in the presence of a palladium hydrogenation catalyst.

2,773,674
PROCESS FOR THE PRODUCTION OF ALLOPREGNANE-3β, 11β, 17α, 20β, 21-PENTOLS
Carl Djerassi, Birmingham, Mich., and George Rosenkranz, Mexico City, Mexico, assignors, by mesne assignments, to Syntex S. A., Mexico City, Mexico, a corporation of Mexico
No Drawing. Application July 30, 1952, Serial No. 301,982
Claims priority, application Mexico August 1, 1951
9 Claims. (Cl. 260—397.5)

1. A process for the production of a compound of the following formula:

wherein R is selected from the group consisting of hydrogen, a lower fatty acid acylate and benzoate, which comprises subjecting a compound of the following formula:



wherein R represents the same group previously set forth and X is selected from the group consisting of C—O and CH—OR, to reduction with lithium aluminum hydride.

2,773,675
CHEMICAL COMPOUNDS AND PROCESSES OF PREPARING THE SAME
Evelyn H. Wilson, East Orange, and Max Tishler, Westfield, N. J., assignors to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey
No Drawing. Application May 18, 1951, Serial No. 227,102
10 Claims. (Cl. 260—397.45)

1. The process of preparing $\Delta^1$-3,11,20-triketo-17α-hydroxy-21-acetoxy-allopregnene which comprises reacting $\Delta^4$-3,11,20-triketo-17α-hydroxy-21-acetoxy pregnene with hydrogen in the presence of palladium catalyst thereby producing 3,11,20-triketo-17α-hydroxy-21-acetoxy-allopregnane, reacting the latter compound with bromine to form 2-bromo-3,11,20-triketo-17α-hydroxy-21-acetoxy-allopregnane, and reacting said 2-bromo-3,11,20-triketo-17α-hydroxy-21-acetoxy-allopregnane with a dehydrohalogenating agent.

2,773,676
PROCESS OF PREPARING COMPOUNDS HAVING ADRENO-CORTICAL HORMONE ACTIVITY
Tadeus Reichstein, Basel, Switzerland, assignor to Organon, Inc., Orange, N. J., a corporation of New Jersey
Application November 5, 1951, Serial No. 254,880
Claims priority, application Netherlands September 13, 1947
12 Claims. (Cl. 260—397.45)

1. A $\Delta_{14,15}$-pregnene compound of the formula

wherein X and Y are substituents selected from the group consisting of the hydroxyl group, a lower alkanoyloxy group, a carbo-(lower) alkoxy group, the benzoyloxy group, a lower alkoxy group, and the keto group, and R is the hydroxyl group and a lower alkanoyloxy group.

2,773,677
PREPARATION OF STEROID 21-ALDEHYDES
John P. Conbere, Fanwood, N. J., assignor to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey
No Drawing. Application June 16, 1953, Serial No. 362,135
6 Claims. (Cl. 260—397.45)

6. A process which comprises reacting a compound selected from the group consisting of 20 - keto - 21-hydroxypregnenes, 20 - keto - 21 - hydroxy - allopreg-

nanes and 20 - keto - 21 - hydroxypregnanes with cupric acetate to produce the corresponding 20 - keto - 21 - aldehyde compound.

---

2,773,078

## PREPARATION OF GLYOXYL STEROIDS

John Wolfhard, Maplewood, N. J., assignor to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey

No Drawing. Application June 16, 1953, Serial No. 362,153
14 Claims. (Cl. 260—397.45)

2. A process which comprises reacting $\Delta^4$-pregnene-17α,21-diol-3,11,20-trione with air in the presence of an oxidation catalyst selected from the group consisting of alcohol-soluble iron salt oxidation catalysts and alcohol-soluble copper salt oxidation catalysts to form $\Delta^4$-pregnene-17α-ol-21-al-3,11,20-trione.

---

2,773,079

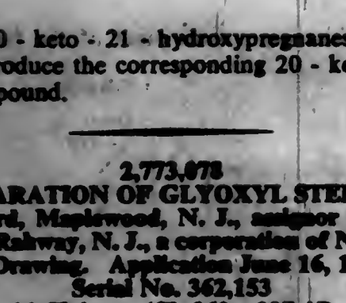
## CYCLOPENTANOPHENANTHRENE DERIVATIVES AND METHOD FOR PREPARATION THEREOF

Carl Djerassi, Birmingham, Mich., and George Rosenkranz, Mexico City, Mexico, assignors, by mesne assignments, to Syntex S. A., Mexico City, Mexico, a corporation of Mexico

No Drawing. Application September 3, 1952, Serial No. 307,722
Claims priority, application Mexico September 20, 1951
2 Claims. (Cl. 260—397.45)

2. A new compound consisting of allopregnane-3β, 11α, 17α-triol-20-one having a melting point of 253°–255° C.

---



2,773,080

## $\Delta^4$-PREGNENES

Seymour Bernstein, Pearl River, N. Y., and Robert Herman Lenhard, Ridgefield Park, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application June 30, 1955, Serial No. 519,249
6 Claims. (Cl. 260—397.45)

1. A compound selected from those having the general formula:

in which R and R' are members of the group consisting of hydrogen and lower alkanoyl radicals and Hal is a halogen radical.

---

2,773,081

## PREVENTION OF HYDROGENATION ODOR

Leo C. Brown and Dwight R. Merker, Chicago, Ill., assignors to Swift & Company, Chicago, Ill., a corporation of Illinois

No Drawing. Application December 31, 1952, Serial No. 329,116
1 Claim. (Cl. 260—409)

A method for retarding the development of characteristic odors of hydrogenation in hydrogenated fatty materials, which comprises steam: deodorizing said fatty material prior to hydrogenation thereof; supplying a blanket of inert gas thereto subsequent to deodorization thereof, whereby non-oxidizing conditions exist; and thereafter, subjecting said material under such conditions to hydrogenation.

2,773,082

## TREATMENT OF RAW MATERIALS CONTAINING FATTY MATERIALS

Israel Harris Chayen, London, England, assignor to British Glues and Chemicals Limited, Garden City, England, a British company

No Drawing. Application February 13, 1953, Serial No. 336,887
14 Claims. (Cl. 260—412)

1. The process of recovering fatty material from fatty-material-containing raw material, a substantial portion of the residue of which after removal of the fatty material therefrom is at least colloidally soluble in water so as to produce a difficultly separable mixture when pieces of said raw material are subjected to intense impacts in the presence of water, said process comprising, subjecting pieces of said raw material to said intense impacts while surrounded by an organic solvent inert to said material in an amount several times the amount of said raw material and in which at least some of said raw material is substantially less soluble than in water so as to produce a resulting mixture in which fatty material is removed from said pieces to leave residues of said pieces which are readily separable from said resulting mixture, and separating said residues of said pieces from said resulting mixture to leave said solvent containing the removed fatty material.

---

2,773,083

## PROCESS OF PRODUCING ORGANIC IRON AND ALUMINIUM ALCOHOLATES

Fritz Schmidt and Otto Bayer, Leverkusen, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Application August 8, 1951, Serial No. 240,974
Claims priority, application Germany August 23, 1950
5 Claims. (Cl. 260—439)

1. A process for the production of metal alcoholates, which comprises dissolving an anhydrous metal halide selected from the group consisting of iron halide and aluminum halide in a lower alkanol, in the molar ratio of at least 3 mols of alcohol per mol of metal halide, substantially neutralizing the resulting acidic alcoholic solution of said halide with an anhydrous nitrogen compound selected from the group consisting of ammonia and cyclohexyl amine, and recovering metal alcoholates.

---

2,773,084

## CATALYTIC CARBON MONOXIDE HYDROGENATION WITH HIGH ESTER YIELD

Walter Rottig, Oberhausen-Sterkrade-Nord, Germany, assignor to Ruhrchemie Aktiengesellschaft, Oberhausen-Holten, and Luigi Gesellschaft für Wasserstoffchemie m. b. H., Frankfurt am Main Heddernheim, Germany

No Drawing. Application April 2, 1952, Serial No. 280,172
Claims priority, application Germany April 12, 1951
1 Claim. (Cl. 260—449.6)

In the method for the catalytic hydrogenation of carbon monoxide with the production of synthesis products containing a major portion of oxygenous compounds in which a carbon monoxide hydrogen containing synthesis gas is contacted at an elevated temperature with a precipitated iron catalyst containing a free alkali oxide calculated as $K_2O$ and present in amount of about 5 to 12% $K_2O$ and being substantially free from alkali compounds of non-volatile acids and containing 0 to 20% inert carrier based on the iron present, said catalyst being reduced with a hydrogen containing gas at a temperature of 250 to 350° C. prior to said contacting to reduction value of at least 60%, the improvement for increasing the yield of high molecular weight esters and reducing the yield of hydrocarbons having 1–2 carbon atoms which comprises effecting said contacting with a synthesis gas containing from 0.5 to 1.2 parts by volume of hydrogen

for every part by volume of carbon monoxide, and recovering the hydrogenation products produced containing a high yield of high molecular weight esters and a low yield of hydrocarbons having 1–2 carbon atoms.

---

2,773,085

## PRODUCTION OF CARBON MONOXIDE HYDROGENATION PRODUCTS WITH A HIGH CONTENT OF OXYGENOUS COMPOUNDS

Walter Rottig, Oberhausen-Sterkrade-Nord, Germany, assignor to Ruhrchemie Aktiengesellschaft, Oberhausen-Holten, and Luigi Gesellschaft für Wasserstoffchemie m. b. H., Frankfurt am Main, Heddernheim, Germany

No Drawing. Application March 10, 1951, Serial No. 215,010
Claims priority, application Germany March 24, 1950
12 Claims. (Cl. 260—449.6)

1. Method for the catalytic hydrogenation of carbon monoxide with the production of synthesis products containing more than 60% oxygenous compounds which comprises contacting a synthesis gas which contains at least 1.2 parts by volume of hydrogen for each part by volume of carbon monoxide with a precipitated iron catalyst at elevated temperature at a pressure of about 10 to 100 atmospheres in excess of atmospheric pressure, said precipitated iron catalyst containing a free alkali oxide calculated as $K_2O$ present in amounts of about 5 to 12% $K_2O$ and being substantially free from alkali compounds of non-volatile acids, and containing 0–20% of an inert carrier based on the iron present, said catalyst being reduced with a hydrogen-containing gas at a temperature of about 250 to 350° C. prior to said contacting to a reduction value of at least 60%, and recovering carbon monoxide hydrogenation synthesis products containing more than 60% oxygenous compounds.

---

2,773,086

## PRODUCTION OF ISOCYANATES FROM SUBSTITUTED UREAS

Robert J. Slocombe, Dayton, Ohio, and James H. Saunders, Anniston, Ala., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application January 19, 1953, Serial No. 332,086
13 Claims. (Cl. 260—453)

2. The method of preparing monocarbamyl chlorides and the corresponding isocyanic acid esters, which comprises reacting, in the vapor phase and at a temperature within the range of about 300° C. to about 500° C., hydrogen chloride and a disubstituted urea of the following general formula:

RNH—CO—NHR

wherein R is a substituent selected from the group consisting of alkyl, cycloalkyl, aryl and halogen derivatives thereof, said reactants being employed in a hydrogen chloride/disubstituted urea molar ratio of from 1:1 to at least 2:1.

---

2,773,087

## METHOD FOR THE PRODUCTION OF α-SUBSTITUTED ORGANIC CARBONYL COMPOUNDS

Gilbert Stork, Leonia, N. J.

No Drawing. Application September 3, 1954, Serial No. 454,199
7 Claims. (Cl. 260—464)

1. A method for the preparation of an α-substituted organic carbonyl compound selected from the group consisting of aldehydes and ketones containing a hydrogen atom on a carbon atom contiguous to the carbonyl group which comprises condensing the organic carbonyl compound with a secondary amine to form an enamine, reacting the enamine with an α,β-unsaturated organic compound in an organic solvent to effect substitution in the α position, and decomposing the resulting α-substitution product with water.

2,773,088

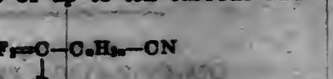
## METHOD FOR THE MUTUAL SEPARATION OF ACRYLONITRILE, ACETONITRILE, AND PROPIONITRILE FROM AQUEOUS SOLUTIONS

Frank Medina, Brookline, Mass., assignor to National Research Corporation, Cambridge, Mass., a corporation of Massachusetts

Application May 18, 1955, Serial No. 509,140
5 Claims. (Cl. 260—465.1)

1. A method for the mutual separation of acrylonitrile, acetonitrile and propionitrile from an aqueous solution thereof which comprises feeding said aqueous solution into an acetonitrile extractor, introducing into said extractor a selective solvent for acetonitrile comprised of an aqueous solution substantially saturated with acrylonitrile and propionitrile, withdrawing from said acetonitrile extractor a fraction comprising an aqueous acetonitrile solution containing less than about 15 percent acrylonitrile and propionitrile, introducing said impure aqueous acetonitrile solution into an extractive distillation column, introducing water into the top of said extractive distillation column as solvent, withdrawing an aqueous solution of substantially pure acetonitrile from the bottom of said extractive distillation column, removing a mixture of acrylonitrile, propionitrile and less than about 15 percent water overhead from said extractive distillation column and feeding said mixture to said acetonitrile extractor as solvent, removing from said acetonitrile extractor a second fraction comprising a mixture of acrylonitrile, propionitrile and less than about 15 percent water, introducing said latter mixture into an azeotropic distillation column, removing overhead from said azeotropic column the water azeotropes of acrylonitrile and propionitrile, separating said water azeotropes of acrylonitrile and propionitrile into an aqueous phase saturated with acrylonitrile and propionitrile and an organic phase, feeding said aqueous phase to said acetonitrile extractor as solvent, returning said organic phase to said azeotropic distillation column as reflux, withdrawing a substantially anhydrous mixture of acrylonitrile and propionitrile from the bottom of said azeotropic distillation column, introducing said substantially anhydrous mixture into a fractional distillation column and recovering substantially pure anhydrous acrylonitrile and propionitrile therefrom.

---



2,773,089

## FLUORINATED OLEFINIC NITRILES

John Lynde Anderson, Northwood, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 29, 1954, Serial No. 465,748
11 Claims. (Cl. 260—465.7)

3. A difluoronitrile of up to ten carbons and of the formula

wherein $n$ is a cardinal number up to six and R is a member of the class consisting of hydrogen and monovalent hydrocarbon radicals free of aliphatic unsaturation, R and $C_nH_{2n}CN$ totaling up to eight carbons.

---

2,773,090

## PROCESS FOR PREPARING PURE DIMETHYLTEREPHTHALATE FROM THE CARBONYLATION OF AROMATIC HALIDES

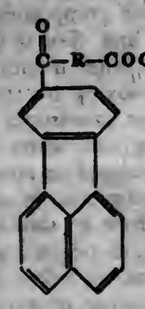
Henry J. Lolkema, Orange, Tex., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application March 10, 1953, Serial No. 341,683
4 Claims. (Cl. 260—475)

1. In a process for preparing dimethylterephthalate containing an amount of acidic impurity not in excess of

0.01 milliequivalent per gram, from the crude reaction products obtained by heating a carbonylation mixture comprising p-dichlorobenzene, carbon monoxide, nickel carbonyl, and an esterifying component comprising methanol, at a temperature within the range of 275 to 425° C. and a pressure within the range of 300 to 1000 atm., the steps which comprise separating the liquid phase from the said crude reaction products, stripping readily volatile ingredients therefrom, adding methanol to the resulting crude ester, heating the resulting mixture at a temperature of 200 to 325° C. under autogenous pressure, and distilling the resulting mixture whereby a dimethylterephthalate fraction containing an amount of acidic impurity not in excess of 0.01 milliequivalent per gram is obtained.

---



2,773,091

## FLUORANTHENEOXOCARBOXYLIC ACIDS AND THE PRODUCTION THEREOF

Robert R. Burtner, Skokie, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application October 12, 1953, Serial No. 385,673
10 Claims. (Cl. 260—515)

1. An ω-oxo-ω-8-fluoranthenecarboxylic acid derivative of the formula

wherein R is selected from the group consisting of bivalent, saturated, acyclic, hydrocarbon radicals of empirical formula

$C_nH_{2n}$

and bivalent, unsaturated, acyclic, hydrocarbon radicals of empirical formula

$C_nH_{2n-2}$

*n* in the preceding empirical formulas being a positive integer greater than 1 and less than 9, and Z is selected from the group consisting of hydrogen and one equivalent of a cation.

---

2,773,092

## DIMERIZATION PROCESS

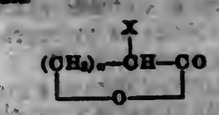
David R. Carley and Walter E. Foster, Baton Rouge, La., assignors to Ethyl Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 6, 1954, Serial No. 473,487
8 Claims. (Cl. 260—533)

1. The process for dimerization of a conjugated hydrocarbon polyene in the presence of an alkali metal to produce a dialkali metal polyene adduct comprising adding a conjugated polyene having between 4 and 16 carbon atoms to a reaction medium maintained at a temperature below about 50° C. containing finely dispersed alkali metal having a particle size not greater than 50 microns, between about 0.0001 and 10 percent of a diaryl ketone and at least 300 percent of an aliphatic solvent selected from the group consisting of ethers, acetals and tertiary amines, both percentages being based upon the weight of said alkali metal, said polyene being employed in a total quantity not exceeding about 1 mole per mole of alkali metal.

2. The process of claim 1 wherein the reaction mixture so-formed, including said diaryl ketone, is thereafter treated with a Grignard reactant selected from the group consisting of carbonyl, thionyl and nitrile compounds.

---



2,773,093

## PROCESS FOR THE PRODUCTION OF AMINOCARBOXYLIC ACIDS AND THEIR N-SUBSTITUTED DERIVATIVES

Adolf Christian Josef Opfermann, Bergisch-Gladbach, Germany

No Drawing. Application September 16, 1952, Serial No. 309,538
Claims priority, application Germany September 17, 1951
4 Claims. (Cl. 260—534)

1. A process for the preparation of an ω-aminocarboxylic acid, which comprises the steps of heating a lactone of the formula

wherein *n* is a whole number from 2 to 5 inclusive, and X is selected from the group consisting of H, Br and $NH_2$, with a carboxylic acid amide, selected from the group consisting of formamide, acetamide, propionamide, palmitamide, stearamide, salicylamide and benzoylamide, whereby splitting of the lactone ring takes place with formation of the corresponding N-substituted aminocarboxylic acid of the formula

wherein *n* and X have the aforesaid significances and R.CO.NH is the radical of the aforesaid carboxylic acid amide, and then converting the said N-substituted aminocarboxylic acid into the corresponding ω-aminocarboxylic acid of the formula

wherein *n* and X again have the aforesaid significances, by means of a saponifying agent.

---

2,773,094

## OXIDATION OF FATTY ACIDS

Robert D. Englert, Palo Alto, and Lawrence M. Richards, Los Altos, Calif., assignors to Tallow Research, Inc., San Francisco, Calif., a corporation of California

Application December 14, 1953, Serial No. 398,020
13 Claims. (Cl. 260—537)

1. The process of converting saturated fatty acids of 14 to 18 carbon atoms to dibasic acids of lower molecular weight which comprises intimately contacting said fatty acids with an oxidizing agent consisting of dilute nitric acid at a temperature of 100 to 250° C. and a pressure in the range of about 50 to 500 p. s. i. gage, the mol ratio of nitric acid to fatty acid charged being within the range of about 4:1 to 30:1 and separating from the unconverted fatty acid, dibasic organic acids of lower molecular weight.

---

2,773,095

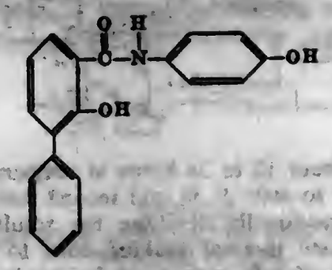
## PRODUCTION OF DIBASIC ACIDS

Robert D. Englert, Menlo Park, and Lawrence M. Richards, Los Altos, Calif., assignors to Tallow Research, Inc., San Francisco, Calif., a corporation of California

Application November 1, 1952, Serial No. 318,252
12 Claims. (Cl. 260—537)

1. The process of making dibasic acids by cleaving unsaturated fatty acids of about 14 to 18 carbon atoms which comprises subjecting them to the action of an oxidizing agent consisting of dilute nitric acid at a temperature of about 125–200° C. and pressure of about 10–500 p. s. i. gage and thereafter isolating dibasic acids from the reaction products.

---



2,773,096

## N-(4-HYDROXYPHENYL)-3-PHENYLSALICYLAMIDE

Melville Sahyun, John A. Faust, and Leonard H. Jules, Santa Barbara, Calif., assignors, by mesne assignments, to Cutter Laboratories, Inc., Berkeley, Calif., a corporation of California

No Drawing. Application February 12, 1953, Serial No. 336,646
2 Claims. (Cl. 260—559)

1. N-(4-hydroxyphenyl)-3-phenylsalicylamide having the formula:

---

2,773,097

## ALKALI SPLITTING OF SECONDARY AND TERTIARY FORMAMIDES

Harry E. Albert, Akron, and Richard W. Kibler, Cuyahoga Falls, Ohio, assignors to The Firestone Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

No Drawing. Application September 14, 1953, Serial No. 380,090
8 Claims. (Cl. 260—563)

2. Method of producing a primary amine which includes the step of reacting a N-substituted formamide with a solid alkali metal hydroxide, substantially in the absence of water.

---

2,773,098

## PREPARATION OF N,N'-DIBENZYLETHYLENEDIAMINE

Melvin A. Rebenstorf, Kalamazoo, Mich., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application August 28, 1952, Serial No. 306,968
3 Claims. (Cl. 260—570.9)

1. In a process for the production of N,N'-dibenzylethylenediamine by the catalytic hydrogenation of N,N'-dibenzalethylenediamine, the improvement which comprises conducting the reduction of said N,N'-dibenzalethylenediamine in a solution of a lower-alkyl acetate.

---

2,773,099

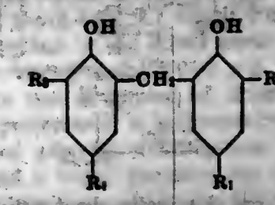
## METHOD FOR THE PREPARATION OF α-SUBSTITUTED ORGANIC CARBONYL COMPOUNDS

Gilbert Stork, Locust, N. J.

No Drawing. Application September 3, 1954, Serial No. 454,209
16 Claims. (Cl. 260—586)

1. A method for the preparation of α-substituted five- and six-numbered ring compounds containing a keto group which comprises condensing a compound selected from the group consisting of five- and six-membered saturated cyclic ring compounds containing a keto group with a secondary amine to form an enamine, reacting the enamine with a member of the group consisting of alkylating and acylating agents in an organic solvent to effect substitution in the α position, and decomposing the resulting α-substitution product with water.

---



2,773,100

## PREPARATION OF 2,2'-METHYLENE-BIS-4,6-DIALKYL PHENOLS

Hugh Wendell Stewart, Plainfield, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application December 30, 1955, Serial No. 556,455
3 Claims. (Cl. 260—619)

1. In the process of preparing a 2,2'-methylene-bis-4,6-dialkyl phenol of the formula

---

## CATALYTIC REACTIONS WITH OSMIUM OXIDE CATALYSTS

Curtis W. Smith and Roy T. Holm, Berkeley, Calif., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

Application July 25, 1952, Serial No. 300,926
4 Claims. (Cl. 260—635)

1. In a process of hydroxylating an olefinic compound by reaction with hydrogen peroxide under the catalytic influence of osmium tetroxide, the improved method of recovering catalyst from the reaction mixture which comprises adding to the reacted mixture sufficient of said olefinic compound to react with the osmium tetroxide present, heating the mixture to about 60° C. to 100° C. to convert the osmium tetroxide to dioxide before distillation of the reaction mixture, then distilling the mixture to remove hydroxylation product therefrom, adding sufficient hydrogen peroxide to the remaining undistilled osmium dioxide to oxidize said dioxide to the tetroxide, distilling off osmium tetroxide from the mixture, and using the thus recovered tetroxide to catalyze further reaction.

## TREATMENT OF BENZENE HEXACHLORIDE

John T. Clarke and Heyt J. Cragg, Baton Rouge, La., assignors to Ethyl Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application July 19, 1952, Serial No. 299,913
1 Claim. (Cl. 260—648)

A process for enhancing the gamma isomer concentration of a benzene hexachloride isomer mixture containing the gamma isomer, comprising extracting the gamma isomer from said mixture with ethylene glycol, cooling the extract obtained therefrom to effect crystallization of an enhanced gamma isomer benzene hexachloride product and recovering said product, the extraction being carried out at a temperature above about 80° C.

---

2,773,103

## ENHANCEMENT OF GAMMA BENZENE HEXACHLORIDE CONTENT

George Calingaert, Geneva, N. Y., assignor to Ethyl Corporation, New York, N. Y., a corporation of Delaware

Original application December 24, 1949, Serial No. 135,022. Divided and this application May 5, 1953, Serial No. 353,081
7 Claims. (Cl. 260—648)

1. In a process for the production of a product containing an enhanced proportion of gamma benzene hexachloride by partially dissolving crude benzene hexachloride obtained from the additive chlorination of benzene

in a solvent selected from the group consisting of lower aliphatic alcohols, benzene, trichlorobenzene, lower alkyl acetates and lower alkyl ethers, said solvent being employed in quantities sufficient to dissolve substantially all the gamma benzene hexachloride contained in said crude benzene hexachloride, separating the thereby

formed solution from the undissolved solids and crystallizing a product containing an enhanced proportion of gamma benzene hexachloride from said solution, the improvement comprising recycling substantially all the solids and solvent of the mother liquor from said crystallization step to said partial dissolution step.

2,773,104

**MANUFACTURE OF HEXACHLOROBENZENE**

Waldo B. Liggett, Berkley, Mich., assignor to Ethyl Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application June 30, 1951, Serial No. 234,673
11 Claims. (Cl. 260—650)

1. A process for the manufacture of hexachlorobenzene comprising treating benzene hexachloride with chlorine in the presence of a catalyst selected from the group consisting of antimony, iron, aluminum, arsenic, bismuth and tin and the halides and oxyhalides thereof at a temperature between about 200° C. and 350° C. until a substantial proportion of hexachlorobenzene is produced.

---

2,773,105

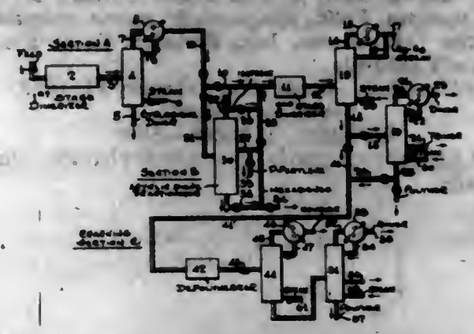
**DEHYDROCHLORINATION OF BENZENE HEXACHLORIDE**

Alfred J. Kolka, Birmingham, Mich., assignor to Ethyl Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application November 24, 1951, Serial No. 258,100
4 Claims. (Cl. 260—650)

1. A process for making trichlorobenzene having an enhanced 1,2,4-trichlorobenzene concentration by dehydrochlorination of benzene hexachloride, which comprises contacting benzene hexachloride at a temperature of between about 180° C. and a temperature at which substantial decomposition of trichlorobenzene takes place with activated carbon.

---



2,773,106

**PROCESS FOR RECOVERY OF ACYCLIC DIENE DIMERS**

Glen P. Hammer, Baton Rouge, La., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application March 19, 1952, Serial No. 277,422
5 Claims. (Cl. 260—666)

1. A process for separating and recovering cyclic $C_5$–$C_6$ diolefins as dimers and polymers and separately $C_5$–$C_6$ acylic diolefins as dimers and higher polymers from a cracked hydrocarbon fraction rich in monomers of the $C_5$–$C_6$ diolefins, which comprises thermally soaking said fraction at temperatures in the range of 180° to 240° F. for about 4 to 12 hours until the cyclic diolefins present in said fraction are dimerized selectively with negligible dimerization and negligible codimerization of the acyclic diolefins, fractionally distilling the undimerized components of said fraction including said acyclic diolefins from the resulting cyclic diolefin dimer and polymer product, passing the distilled undimerized components containing the acyclic diolefins into a second thermal soaking zone, subjecting the acyclic diolefins to thermal

soaking for about 12 to 24 hours at temperatures in the range of 250° to 400° F. in said second thermal soaking zone, then fractionally distilling the resulting product from the second thermal soaking zone to remove unreacted acyclic diolefin monomers from a bottoms liquid heated to 300° to 340° F., and fractionating said bottoms liquid to separate an intermediate fraction of acyclic diolefin dimers boiling in the range of 300° F. to 400° F. from higher boiling trimers and polymers.

2,773,107

**RECOVERY OF AROMATIC HYDROCARBONS FROM HF-$BF_3$ AGENT**

Charles D. Kalfadelis, Hammond, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application February 3, 1955, Serial No. 486,021
5 Claims. (Cl. 260—668)

1. In the process where a benzene hydrocarbon is treated with liquid HF–$BF_3$ agent to produce a solution comprising HF–$BF_3$-polyalkylbenzene complex and liquid HF, said polyalkylbenzene containing from 2 to 4 alkyl groups with each alkyl group containing from 1 to 4 carbon atoms, and the hydrocarbons in said solution are recovered as a liquid drainoff product by distilling HF and $BF_3$ from said solution, the improvement which comprises introducing into said solution in said distillation zone $BF_3$ stripping gas.

---

2,773,108

**ETHYLATION PROCESS**

Edwin F. Peters, Lansing, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application October 29, 1954, Serial No. 465,754
5 Claims. (Cl. 260—671)

1. A process for the ethylation of an aromatic hydrocarbon, which process comprises contacting said aromatic hydrocarbons with ethylene at a temperature between about 100° F. and about 350° F. in the presence of an acidic catalyst consisting essentially of a major proportion by weight of silica and a minor proportion by weight of alumina, which catalyst has been activated before use in said ethylation by treatment with hydrogen under a pressure of at least about 20 p. s. i. at a temperature between about 400° F. and about 1000° F. for a period of time sufficient to effect substantial activation of said catalyst for said ethylation of an aromatic hydrocarbon.

2,773,109

**ETHYLBENZENE DISPROPORTIONATION**

Arthur P. Lien, Highland, Ind., and David A. McCaulay, Chicago, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application July 20, 1954, Serial No. 444,672
6 Claims. (Cl. 260—671)

1. A disproportionation process which comprises contacting ethylbenzene, in the absence of reactive hydrocarbons, under substantially anhydrous conditions, with at least about 3 moles of liquid HF and with at least about 0.4 moles of $BF_3$ respectively per mole of ethylbenzene at a temperature of at least 75° C. for about a time at least one-half hour, thereby producing a reaction product mixture wherein triethylbenzene predominates over diethylbenzene and removing HF and $BF_3$ to obtain a reaction product mixture comprising essentially benzene, ethylbenzene, 1,3-diethylbenzene and 1,3,5-triethylbenzene.

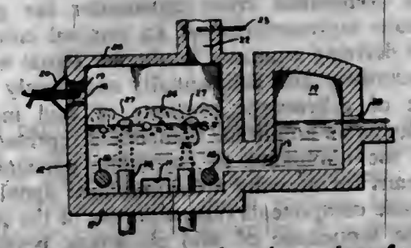
2,773,110

**PURIFICATION OF PARAFFIN HYDROCARBONS BOILING ABOVE ABOUT 380° C.**

Robert Liben, Oberhausen, Germany, assignor to Ruhrchemie Aktiengesellschaft, Oberhausen-Holten, Germany, a corporation of Germany

No Drawing. Application June 11, 1952, Serial No. 292,977
Claims priority, application Germany June 19, 1951
5 Claims. (Cl. 260—676)

1. Process for the purification of paraffin hydrocarbons boiling above about 380° C. which comprises contacting such a hydrocarbon in the liquid phase with hydrogen at a temperature between about 100 and 300° C. at an elevated pressure not in excess of about 30 atmospheres gauge in the presence of a hydrogen-transferring catalyst and a saturated aliphatic hydrocarbon having 7 to 9 carbon atoms and a vapor pressure not in excess of about 1 atmosphere absolute at about 100° C. and recovering the purified hydrocarbon formed.



## ELECTRICAL

2,773,111

**METHOD AND APPARATUS FOR MANUFACTURING GLASS**

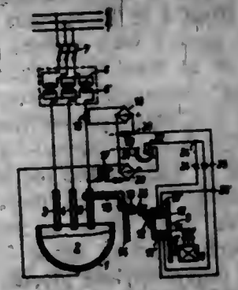
Pierre Arbeit, Paris, and André Mathey, St. Romain le Puy, France, assignors to Societe Anonyme des Manufactures des Glaces et Produits Chimiques de Saint-Gobain, Chauny & Cirey, Paris, France

Application July 1, 1952, Serial No. 296,552
Claims priority, application France January 23, 1948
13 Claims. (Cl. 13—6)

4. The method of fining glass in a glass furnace that comprises maintaining above the glass undergoing fining beneath the crown of the furnace a temperature circa 1000–1100° C. whereby to form a persisting bubble blanket, and fining the glass beneath the blanket by Joule effect.

5. A furnace for making glass having a thin, heat dissipating crown above the fining zone, a set of horizontal electrodes beneath the operating glass level, and a set of upright electrodes beneath the operating glass level, both sets being in the fining zone.

---



2,773,112

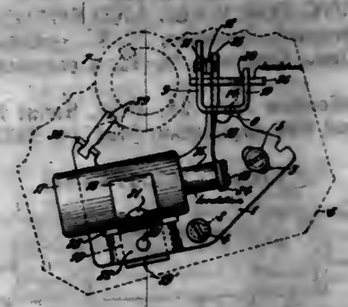
**ARRANGEMENT FOR POSITIONING ELECTRODES OF AN ELECTRIC ARC FURNACE**

Otto Grebe, Olpe, Westphalia, Albert Driller, Frankfurt am Main, and Kurt Rühring, Frankfurt, Bockenheim, Germany, assignors to Licentia Patent-Verwaltungs-G. m. b. H., Hamburg, Germany

Application October 5, 1953, Serial No. 384,212
Claims priority, application Germany October 3, 1952
11 Claims. (Cl. 13—13)

1. An arrangement for adjusting the position of an electrode of an electric arc furnace, comprising, in combination, a receiver adapted to hold a charge to be melted; support means having an electrode carrier portion adapted to hold an electrode over said charge in said receiver so as to enable formation of an arc between said electrode and said charge, said support means being movable toward and away from said charge in said receiver; rotatable driving means; means for permanently rotating said driving means; and coupling means having a variable transmission ratio for interconnecting said movable support means and said driving means during rotation of the

latter for moving said electrode carrier portion of said support means toward and away from said charge in said receiver.



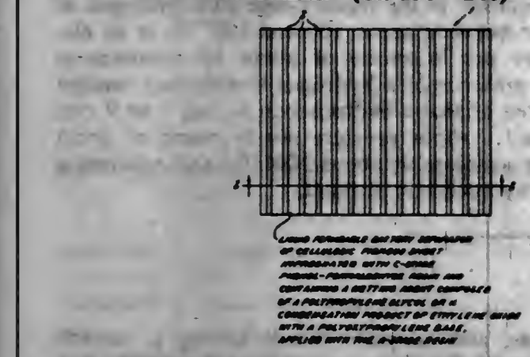
---

2,773,113

**BREAKER POINT MECHANISM**

Albert I. Alstrom, Longmeadow, Mass., assignor, by mesne assignments, to Globe-Union Inc., a corporation of Delaware

Application December 21, 1953, Serial No. 399,225
3 Claims. (Cl. 123—146.5)



3. Breaker-point mechanism, comprising, a supporting member having first and second arms disposed in spaced and substantially parallel relation, a breaker point fixed to the first arm facing toward the second arm, a plunger extending between said arms and slidably mounted at its ends therein for movement in a direction at right angles thereto, said plunger having at a location intermediate its ends and between said arms an opening which extends through it at right angles to the direction of its sliding movement, a spring breaker arm fixedly supported at one end from said member and extending in a direction substantially at right angles to said direction through said opening and having an end projecting beyond the plung-

er, and a breaker point fixed to said breaker arm and held to the first-named breaker point by the spring pressure of the breaker arm.

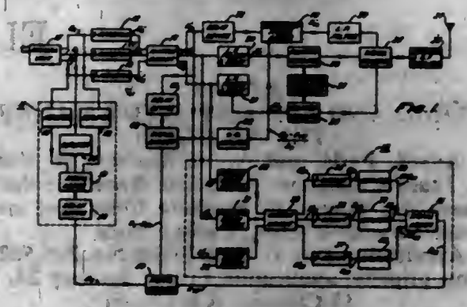
**2,773,114**
**BATTERY SEPARATOR AND METHOD OF MAKING SAME**
Robert R. McAuliss, Cranston, R. I., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application August 31, 1954, Serial No. 453,332
10 Claims. (Cl. 136—146)

1. A liquid permeable battery separator made from a bibulous cellulosic fibrous sheet having an air permeability (Gurley) of from 4 to 19 seconds (using a 5 ounce cylinder and a ¼ square inch orifice), having an alpha cellulose content of at least 90 percent and exhibiting uniform "formation" thoroughly impregnated with an intimate mixture of a C-stage phenol-formaldehyde resin formed by curing an A-stage phenol-formaldehyde resin uniformly deposited in and around the fibers of the sheet by drying from solution in a solvent therefor, said C-stage phenol-formaldehyde resin being in intimate admixture with a nonionic surface active agent selected from the group consisting of polypropylene glycols having a molecular weight of at least 1250 and the products of condensation of ethylene oxide with a polyoxypropylene base, said products of condensation containing up to 60 percent of ethylene oxide and at least 40 percent of a polyoxypropylene base and having a molecular weight of from 890 to 3600, in amount equal to from 0.1 to 5 percent by weight based on the weight of said C-stage phenol-formaldehyde resin.

---



**2,773,115**
**MOUNTING FOR WALL AND SWITCH BOXES**
Victor R. Despard, Syracuse, N. Y., assignor to Pass & Seymour Inc., Syracuse, N. Y., a corporation of New York
Original application June 25, 1951, Serial No. 233,313. Divided and this application May 19, 1952, Serial No. 288,725
3 Claims. (Cl. 174—58)

1. The combination of an electric wiring box for mounting from the exposed or room side of and through an opening in a finished wall and box holding supports for engaging the concealed or back face of the wall and the free edges surrounding the open side of the box, said box being formed of moulded plastic material having end and side walls forming a rectangular configuration open at the front or face adapted to be flush with the exposed side of the wall and closed at the opposite face, electric contacts and terminals permanently mounted and exposed in said box intermediate its ends, an integral flange near each front corner of the box projecting to engage the exposed wall face adjacent the corners of the opening therein, each box holding support having a sheet metal head to engage the concealed face of the wall and a strap extending therefrom to pass between an end wall of the box and an end of the wall opening for bending over the free edge of said end wall, said box having an integral wall spaced from each end wall to define therewith an inside compartment to receive and isolate the bent-over end of the adjacent support strap from the said electrical contacts and terminals.

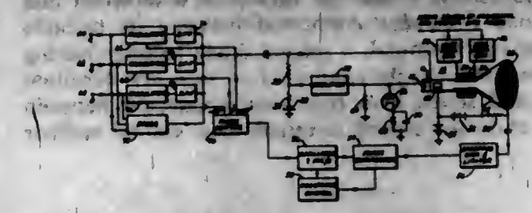
**2,773,116**
**LUMINANCE CORRECTION APPARATUS FOR COLOR TELEVISION SYSTEMS**
John B. Chatten, Philadelphia, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application August 20, 1953, Serial No. 375,505
9 Claims. (Cl. 178—5.2)

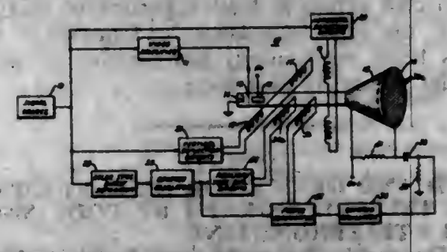


1. In a compatible color transmitter for generating transmissions representative of an original color image: means for deriving a normal luminance signal which represents accurately and substantially completely the total luminance of achromatic portions of said image and which contains an amplitude component representative of a part of the luminance of chromatic portions of said image; means for deriving a chrominance signal containing amplitude components representative of the remaining part of the luminance of said chromatic portions; frequency-discriminatory means for limiting said chrominance signal to a bandwidth substantially less than that of said luminance signal, thereby to introduce deficiencies in the representation of higher-frequency variations in the luminance of said chromatic image portions; means for generating a true-luminance signal representative of the total luminance of said image throughout a frequency band greater than that of said chrominance signal; means responsive to said normal luminance signal and to said chrominance signal to produce an output signal indicative of those luminance variations which will be produced in the reproduced image of an ideal receiver supplied with said normal luminance signal and said chrominance signal; means for comparing said output signal with said true-luminance signal to derive difference signals indicative of discrepancies in the luminance of said reproduced image; and means responsive to said difference signals to generate a correction signal for combination with said normal luminance signal, to counteract said deficiencies in luminance representation.

---

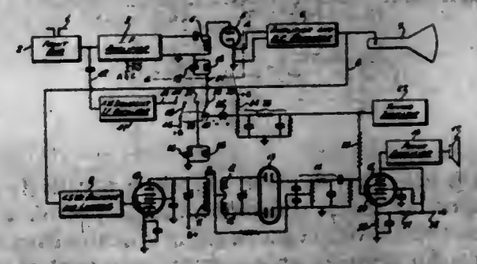
**2,773,117**
**CATHODE RAY TUBE BEAM INTENSITY CONTROL**
Richard G. Clapp, Narberth, and Lincoln W. Hershberger, Oreland, Pa., assignors to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application February 23, 1954, Serial No. 411,758
15 Claims. (Cl. 178—5.4)

1. A cathode ray tube system comprising a cathode ray tube having means for generating an electron beam, means including a control electrode for varying the intensity of said beam and a beam intercepting member, means for producing a signal having variations determined by the intensity variations of said beam, means coupled to said signal producing means for limiting the amplitude of



said signal when said beam intensity exceeds a given value, and means for applying said signal to said beam intensity control means in a sense to oppose variations in the intensity of said beam when the intensity value thereof is less than said given value.

---



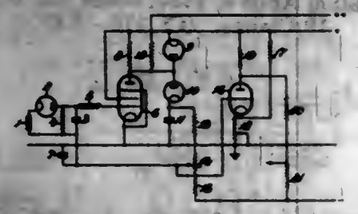
**2,773,118**
**TELEVISION DEFLECTION CONTROL SYSTEM**
Robert C. Moore, Erdenheim, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application July 27, 1953, Serial No. 370,299
7 Claims. (Cl. 178—5.4)

1. In a cathode ray tube display system: means for producing a signal comprising successive portions representative of different intelligence components occurring in a predetermined order, signal portions representative of a particular component recurring at a predetermined rate; a cathode ray tube for producing visible indications of the intelligence represented by said signal, said tube comprising a screen structure, means for projecting an electron beam toward said screen structure and means supplied with said signal and responsive thereto to control the intensity of said beam, said screen structure comprising a plurality of parallel phosphor strips and a plurality of indexing strips, each pair of said indexing strips being associated with one of said phosphor strips and being disposed substantially parallel thereto, the different members of each pair of indexing strips being disposed near opposite edges of the associated phosphor strip and different pairs of said indexing strips being associated with different phosphor strips; means for deflecting said beam across said screen in first and second different directions and at rates such as to trace a plurality of substantially parallel paths upon said screen, successive ones of said parallel paths normally following different ones of said phosphor strips, said rate of beam deflection in said first direction being subject to fortuitous variations which cause the beam to deviate in said first direction from its normal path along said phosphor strips; means for producing cyclical deflections of said beam across said screen in said first direction at a rate substantially equal to said rate of recurrence of portions of said signal representative of a particular intelligence component and with an amplitude sufficient to cause said beam to traverse the width of a phosphor strip during each cycle of said deflection; means for deriving a signal in response to impingement of said beam on said indexing strips; and means for utilizing said derived signal to control the rate of beam deflection in said first direction so as to maintain each of said parallel paths substantially centered within one of said phosphor strips.

---

**2,773,119**
**TUNING SYSTEM FOR RADIO AND TELEVISION RECEIVERS**
Louis W. Parker, Little Neck, N. Y.
Application April 4, 1950, Serial No. 151,279
19 Claims. (Cl. 178—5.8)

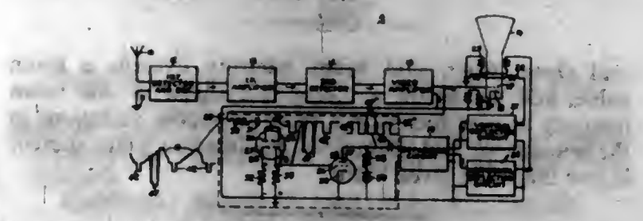
1. A television receiver of the vestigial side band type for receiving a video modulated carrier having a portion of one video side band removed and having a frequency modulated audio channel operating just beyond the limit of the other video side band, comprising in combination, tunable means for receiving the modulated radio waves and producing a radio frequency signal having a band of modulations thereon conforming substantially to those on the received waves, a detector for rectifying the output of said means, means responsive to the video signals existing in the output of said detector for displaying a picture, a selector connected to the output of said detector for selecting the frequency modulated audio signals, a frequency discriminator fed by the output of said selector, an audio amplifier fed by said frequency discriminator, selective means connected to said first-named means and sharply peaked as compared to the band width of the video modulated signals, said selective means being peaked at a frequency within the band of the video signals near the end thereof opposite that which carries the audio modulation, and tuning indicator means responsive to the output of said selective means for increasing the gain of said audio amplifier to increase the output thereof when said selective means is fed with signals at its resonant frequency.



---

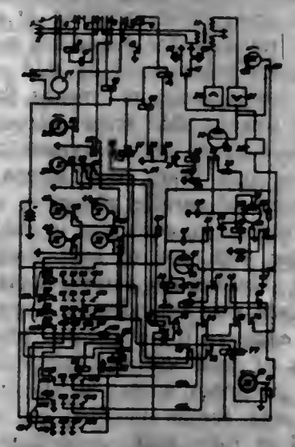
**2,773,120**
**MAGNETIC RECORDING OF HIGH FREQUENCY SIGNALS**
Earl E. Masterson, Palmyra, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application November 30, 1950, Serial No. 198,370
10 Claims. (Cl. 178—6.6)

1. Apparatus for recording high frequency signals on a magnetic tape comprising, in combination, a pair of cylinders disposed in spaced apart, end-to-end relation, said cylinders being coaxial and substantially the same diameter and constituting a mandrel for the tape, a rotary member mounted for rotation on the common axis of said cylinders, driving means for rotating said member, a continuously operable magnetic record-reproduce head mounted on said member in a position to extend into the space between the adjacent ends of said cylinders and engage said tape when wrapped about said mandrel, and a reeling system for driving said tape helically about said mandrel.



2,773,121
**VIDEO AMPLIFIER WITH SIGNAL-INTENSITY-DETERMINED THRESHOLD**
Peter Johannes Hubertus Janssen, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application November 1, 1951, Serial No. 254,258
Claims priority, application Netherlands November 9, 1950
9 Claims. (Cl. 178—7.3)

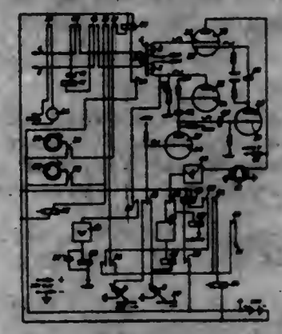
8. In a television receiver wherein a negatively-modulated incoming signal is demodulated to provide a video signal combined with negative-going synchronizing pulses, apparatus for deriving an automatic gain control voltage from the demodulated signal and for separating the synchronizing pulses from the demodulated signal, comprising first, second and third electron discharge tubes each having a cathode, a grid and an anode, a source of operating voltage having a positive-polarity terminal and a negative-polarity terminal, two resistors connected respectively between the anodes of said first and third tubes and said positive-polarity terminal, means connecting the cathodes of said first and third tubes to said negative-polarity terminal, a source of positive potential, a resistor connected between the anode of said second tube and said source of positive potential, a capacitor connected between the cathodes of said first and second tubes, a source of negative bias potential, a resistance connected between the cathode of said second tube and said source of negative bias potential, means connecting the grid of said first tube to a point on said resistance, said negative bias potential having a value to normally bias said first tube with a constant bias so as to pass relatively little current in the absence of said signal, means to apply the demodulated signal to the grid of said first tube to produce an alternating voltage at the anode thereof, a connection between the anode of said first tube and the grid of said second tube whereby a variable bias voltage is developed at said capacitor in accordance with said alternating voltage and is applied to the grid of said first tube thereby stabilizing said alternating voltage and whereby said synchronizing pulses appear at the anode of said second tube, means connected to derive said synchronizing pulses from the anode of said second tube, a resistor connected between the cathode of said third tube and said negative-polarity terminal, a resistor connected between the grid of said third tube and said source of negative bias potential, thereby to bias said third tube in cut-off condition, means connected to apply said variable bias voltage to the grid of said third tube to render said third tube conductive only when said variable bias voltage exceeds a predetermined value, thereby producing an automatic gain control voltage at the anode of said third tube, and means connected to derive said automatic gain control voltage from the anode of said third tube.



2,773,122
**VIDEO FROM SYNC SIGNAL SEPARATOR**
Robert B. Dome, Syracuse, N. Y., assignor to General Electric Company, a corporation of New York
Application September 20, 1951, Serial No. 247,422
5 Claims. (Cl. 178—7.3)

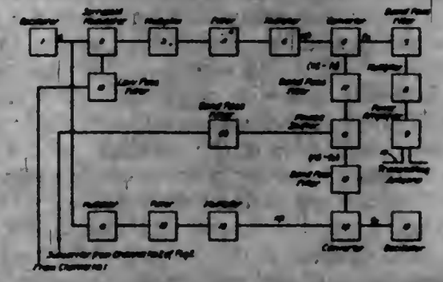
4. In a television receiver comprising first and second input terminals and having a condenser for impressing a composite television signal wave on said first terminal, said wave having periodic synchronizing pulse portions extending in a negative direction with respect to the alternating-current axis of said wave at said first terminal and intermediate video signal portions extending in a positive sense from said axis at said first terminal, the combination therewith of a first diode rectifier having its anode conductively connected to said first terminal and a series load resistance connected between its cathode and said second terminal, a second diode rectifier having its cathode conductively connected to said first terminal and a second series load resistance connected between its anode and said second terminal, said second resistor

being small enough with respect to said first resistor that the net positive charge on said condenser allows said cathode of said second diode rectifier to be depressed below that of said anode of said second diode rectifier only by the synchronizing pulses a video signal utilization circuit connected across at least a portion of said first resistance and a synchronizing pulse utilization circuit connected across at least a portion of said second resistance, the total impedance load presented to said terminals being substantially non-reactive at all signal frequencies present in said wave.

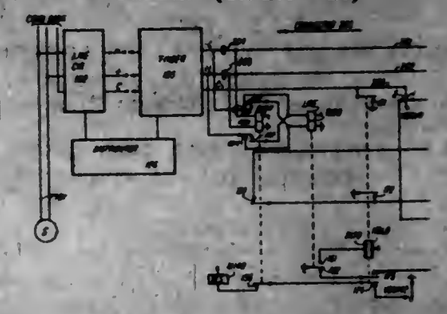


2,773,123
**METHOD AND DEVICE FOR DISTANT CONTROL OF A TELEPHONOGRAPH BY CODE SIGNALS OVER A TELEPHONE LINE**
Max G. Handschin, Kusnacht, near Zurich, Switzerland, assignor to Promundo, Schaan, Liechtenstein, a firm
Application December 27, 1951, Serial No. 263,548
10 Claims. (Cl. 179—6)

5. A telephonograph apparatus including means for reproducing a recorded message over a connected telephone line in response to a coded succession of separate sounds on said telephone line each of a predetermined relative syllabic content corresponding substantially to a predetermined time interval, comprising a series of sound-actuated relays each responsive only to a signal sound of a predetermined duration on said telephone line to successively energize another similar relay responsive to a sound of predetermined duration which may be different from said first duration, and switching means for controlling the successive operation of said relays according to a predetermined code, and means controlled by the last operating relay of the series to initiate reproduction of said message over said telephone line.



2,773,124
**METHOD AND DEVICE FOR CONTROLLING A TELEPHONOGRAPH**
Max G. Handschin, Kusnacht, near Zurich, Switzerland, assignor to Promundo, Schaan, Liechtenstein, a firm
Application December 31, 1951, Serial No. 264,317
5 Claims. (Cl. 179—6)



1. In apparatus for controlling a telephonograph of the type having a recording device and a reproducing device for recording and reproducing messages over a telephone line, and a coding device connected to control said telephonograph in response to signals received over such a line during operation of said reproducing device; the improvement which comprises means for isolating said telephonograph from signals imposed on said line from its reproducing device, said isolating means comprising a repeater transformer having a primary winding connected to said line and having first and second secondary windings, an amplifier connected from the first of said secondary windings to the input of said coding device, a second amplifier connected from the output of said reproducing device to said second secondary winding, and a phase reversing device connected between said amplifiers, whereby signals originating in said reproducing device are cancelled between said amplifiers while signals from said line are amplified and transmitted to said coding device.

2,773,125
**MULTIPLEX FREQUENCY MODULATION TRANSMITTER**
Edwin H. Armstrong, New York, N. Y.; Esther M. Armstrong, executrix of said Edwin H. Armstrong, deceased
Application October 12, 1953, Serial No. 385,483
2 Claims. (Cl. 179—15)

1. A frequency modulation multiplex transmitter for a main channel and at least one auxiliary channel, said transmitter comprising: a first oscillator; a main channel phase shift modulator supplied with current derived from said first oscillator and having an input for the modulating signal of the main channel; an auxiliary phase shift modulator having a modulation input for the modulating signal of the auxiliary channel; circuit means supplying said auxiliary phase shift modulator with current derived from said first oscillator, said circuit means including a first frequency multiplier and a first converter; a second oscillator coupled to said first converter and altering the frequency of the current supplied by said circuit means by a submultiple of the frequency to be transmitted; a second converter coupled to the output of said auxiliary channel modulator; a second frequency multiplier connected between the output of said main channel modulator and said second converter and having the same factor of multiplication as said first frequency multiplier; a filter connected to the output of said second converter and having a characteristic which selects from the output of said second converter the frequency of said second oscillator modified by the modulations of said main and auxiliary modulators; and further frequency multiplying means coupled to the output of said filter for multiplying said modulated second oscillator frequency up to said frequency to be transmitted by said transmitter.

2,773,126
**AUTOMATIC TELEPHONE SYSTEM PROVIDED WITH PARTY LINES AND TRUNK LINES**
Clarence E. Lomax, Chicago, Ill., assignor to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware
Application January 13, 1955, Serial No. 481,567
8 Claims. (Cl. 179—17)

8. A telephone system comprising a plurality of trunk lines serving an operator position station, a party line including a given number of stations thereon, each of said lines being provided with a pair of line conductors and a control conductor, said control conductor carrying thereon an indication of the idle or busy conditions of the corresponding line, a signaling conductor, a given number of marking conductors respectively corresponding to said party lines, a generator for applying in timed sequence in repeated cycles a given number of signals respectively corresponding to said party line stations to said signaling conductor and a marking potential to said marking conductors, whereby a particular signal is applied to said signaling conductor simultaneously with the application of said marking potential to the corresponding particular marking conductor, a connector switch including in a first level contact sets connecting said party line on a terminal-per-station basis and in a second level consecutively arranged contact sets serving said operator station on a terminal-per-line basis, each of said contact sets including a pair of line contacts terminating the line conductors of the respectively associated line and a first control contact terminating the control conductor of corresponding line and a second control contact, said second control contacts in said first level respectively terminating said marking conductors and in said second level being connected to the control conductor of the correspondingly terminated trunk line except in the last of said consecutive contact sets, a wiper set for selectively engaging said contact sets, a wiper motor for driving said wiper set over the contact sets in said levels, a level switch operated when said wiper set is at said second level, a level relay operated in response jointly to the operation of said level switch and to the selection of a one of said contact sets in said second level for connecting a given one of said marking conductors to said connector switch, a test relay, a switch-through relay, means responsive to the selection of a contact set having a busy condition indication on the first control contact thereof for operating said test relay and responsive to the selection of a contact set hav-

ing an idle condition indication on the first control contact thereof for operating said switch-through relay and for thereafter operating said test relay during the periods of the marking potential applied to said connector switch via the second control contact of said contact set or via said level relay, busy means responsive to the operation of said test relay in the absence of operation of said switch-through relay for rendering a busy indication, means responsive to the conjunct operation of said test relay and switch-through relay for connecting said signaling conductor to one of the line contacts of said contact set during the periods of the applied marking potential, and a step relay rendered operative in response jointly to the operation of said level relay and to the operation of said test relay in the absence of operation of said switch-through relay and operated thereafter in response to a busy condition indication on the second control contact of said selected contact set for operating said wiper motor, whereby said wiper set is stepped to the next consecutive contact set.

## CALLING LINE IDENTIFICATION APPARATUS

Ivan V. Coleman, Naperville, Ill., assignor to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Application February 11, 1955, Serial No. 487,572
24 Claims. (Cl. 179—18)

1. A line identification circuit for a telephone system having a group of subscriber lines and having a different multi-digit designation for each line in said group, comprising a single gas-filled electronic device individual to each of said lines, each of said devices having only two electrodes, one of said electrodes of each of said devices connected to a corresponding one of said lines, means controlled over any one of said lines responsive to a call initiated thereover for rendering only the associated one of said gas-filled devices conducting between its electrodes, a first control means connected to the other of said electrodes of all of said devices operated responsive to the conductivity of any one of said devices, a plural digit register, a second control means operated responsive to the operation of said first control means for operating said register to register therein a portion of the multi-digit designation of said one calling line, a group of third control devices including at least one device for each of said lines in said group of lines, connecting means operated in response to the operation of said second control means for connecting said group of third control devices respectively to the one electrode of each of said gas-filled electronic devices connected to said lines in order to operate the particular third control device corresponding to the particular calling one of said lines, means controlled in response to the operation of said third control device for operating said register to register the remaining portion of the multi-digit designation of said calling line, a signal device common to the group of said gas-filled devices corresponding to said group of subscriber lines, means controlled responsive to the initiation of said call on said one line for preparing said signal device for operation, and additional means controlled by said connecting means for illuminating said signal device to indicate the group of gas-filled devices including the conducting gas-filled device individual to said line.

## CROSSBAR-SWITCH CONNECTOR SYSTEM

Robert W. Hutton and Edward J. Leonard, Chicago, Ill., assignors to International Telephone and Telegraph Corporation, New York, N. Y., a corporation of Maryland

Application February 28, 1955, Serial No. 490,892
6 Claims. (Cl. 179—22)

1. In a switching system for interconnecting separately seizable calling trunks with lines called thereover, a crossbar switch including two switching sections and having select magnets common to both sections, each section including a set of horizontal multiples individually selectable by the common select magnets, each section further including a separate set of hold magnets and an associated set of vertical multiples intersecting the horizontal multiples of the section, each section further including crosspoint means for connecting any horizontal multiple of the section to any vertical multiple thereof under the joint control of the hold magnets of the section and the common select magnets, a separate group of the lines and a separate group of the calling trunks associated with each section, with the lines of any section connected to respective multiples of one said set of multiples of the section, and with the associated trunks connected to respective multiples of the other set of multiples of the section, whereby the crosspoint means of the last-said section can interconnect any associated trunk with any associated line, register means and means controlled over any seized trunk for setting it to indicate the line identity of any desired called one of the lines in the group of lines associated with one switch section and to indicate the line identity of a respectively corresponding line in the group of lines associated with the other switch section, a controller common to both switch sections and means for temporarily individualizing it with any trunk over which the said register means has been set, means controlled according to the individualization of the controller with a trunk of one of said trunk groups for indexing one of said groups of lines, and means controlled jointly by the said line-indicating means and group-indexing means for controlling the select magnets of the switch and the hold magnets of the section associated with the individualized trunk to actuate the specific crosspoint means required to connect the individualized trunk to the line called thereover.

## FLAT-BANK CROSSBAR SWITCH

Edwin L. Earle, Chicago, Ill., assignor to International Telephone and Telegraph Corporation, New York, N. Y., a corporation of Maryland

Application July 27, 1955, Serial No. 524,632
3 Claims. (Cl. 179—27.54)

1. A contact bank comprising a succession of upstanding stackups of contact members arranged in a row to provide a longitudinal row of multi-conductor switching groups equal to one less than the number of said stackups, with each switching group including flexible contact members supported by one stackup and extending forwardly into cooperative underlying relationship with respective fixed contact members supported by the next succeeding stackup, each stackup including interspersed contact members and insulating sheets and means clamping them together, each intermediate stackup having clamped therein the base portions of the flexible contact members which extend forwardly therefrom, with each overlaid by a fixed contact member which extends rearwardly from the stackup for cooperation with a flexible contact member supported by the next preceding stackup, each fixed contact member in any stackup succeeding the first being immediately underlaid by an insulating sheet which is sufficiently narrow to provide room under the rearwardly extending portion of such member for the free end of

the cooperating flexible contact member held by the preceding stackup to be moved into and out of contact with the fixed member, the last said insulator in any intermediate stackup being underlaid by the clamped base portion of a flexible contact member, any last said clamped base portion being underlaid by an insulating sheet which is widened to provide a portion which extends rearwardly to underlie the free end of the corresponding contact member which extends forwardly from the next preceding stackup, whereby a definite insulated stopping barrier is provided for each flexible contact member of the switching group in its open, or relaxed, condition, each last said insulator above the lowermost one in the stackup overlying a fixed contact member and barring contact therewith by the free end of the flexible contact member which lies above it.

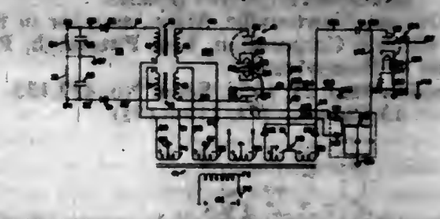
## ACOUSTICAL RESISTANCE FOR PRESSURE TYPE MICROPHONES

Harry F. Olson, Princeton, and John Preston, Metedeconk, N. J., assignors to Radio Corporation of America, a corporation of Delaware

Application March 31, 1953, Serial No. 345,979
5 Claims. (Cl. 179—115.5)

1. A microphone comprising a diaphragm, a pair of pole pieces having an air gap therebetween, a conductor secured to said diaphragm and disposed within said air gap, acoustical resistance means being disposed adjacent one end of said air gap and between said pole pieces, said acoustical resistance means comprising a reticulated annular member having one surface thereof adjacent at least one of said pole pieces, said member providing criss-cross air chambers and passages between said one surface thereof and the surface of said pole piece adjacent thereto, and a backing member secured to the surface of said annular member opposite to said one surface.



---

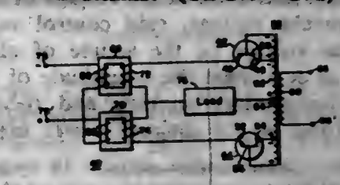
## MAGNETIC AMPLIFIER

Masao Sakamoto, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

Application April 6, 1953, Serial No. 347,099
7 Claims. (Cl. 179—171)

1. A hybrid magnetic amplifier comprising, a pair of magnetic cores, each core having a power winding and a control winding positioned thereon in inductive relation therewith, an alternating current source of power having a plurality of terminals, circuit means connecting one terminal of each of said power windings to said source of power and another terminal of each of said power windings through unidirectional current conducting devices respectively through load means which circuit is completed to another terminal of said source of power, additional circuit means connecting each of said control windings to a terminal of said source of power and further connecting each of said control windings to anodes of a pair of triodes respectively each triode having a control element and a cathode with the additional circuit being completed through common connections of said cathode and said source of power, control circuit means including biasing resistance means connected to the control element of said triodes, means for applying a reference signal to said biasing resistance means, and means applying an alternating signal voltage of variable phase and magnitude to said biasing resistance means.



---

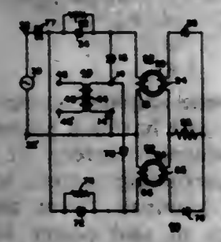
2,773,132

## MAGNETIC AMPLIFIER

Richard L. Bright, Adamsburg, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application June 2, 1954, Serial No. 433,876
2 Claims. (Cl. 179—171)

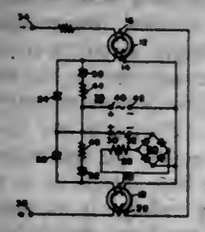
1. In a self-saturating magnetic amplifier for supplying energy to a load, the combination comprising, a magnetic core member, a load winding disposed in inductive relationship with the magnetic core member, a transistor comprising a semiconductive body having an emitter electrode, a collector electrode, and a base electrode all in operative contact therewith, means, interconnected with the load and with the load winding, for providing two synchronous alternating voltages, circuitry connecting said means to the collector electrode and to the emitter electrode so that one of the synchronous alternating voltages is applied between the collector electrode and the emitter electrode, other circuitry connecting the said means to the collector electrode and to the base electrode so that the other synchronous alternating voltage is applied between the collector electrode and the base electrode, the instantaneous polarity of said two synchronous alternating voltages during alternate half-cycles being such that the base electrode is positive with respect to the collector electrode and with respect to the emitter electrode, whereby the transistor during said alternate half-cycles prevents current from flowing through the load winding and the load, and con-



to said unwounded terminals a phase splitter stage com- of said connecting means to thereafter be controllable

trol means, including a control winding disposed in inductive relationship with the magnetic core member, for controlling the flux level in the magnetic core member.

---



2,773,133
MAGNETIC AMPLIFIERS
Wallace J. Dunnet, Newtonville, Mass., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 25, 1954, Serial No. 432,135
13 Claims. (Cl. 179—171)

1. In a magnetic amplifier for controlling the electrical conditions imposed on a load, the combination comprising, a saturable reactor comprising a magnetic core member, a primary winding, and a secondary winding disposed in inductive relationship with the magnetic core member, the secondary winding being connected in circuit relationship with the load, a source of control voltage, a rectifier connected in series circuit relationship with the source of control voltage, a source of alternating-current voltage, the primary winding being connected in parallel circuit relationship with the series circuit comprising the source of control voltage and the rectifier, and circuit means, including an impedance member disposed in non-inductive relationship with respect to the magnetic core member, for connecting said parallel circuit to the source of alternating-current voltage, the voltage of the source of alternating-current voltage being of greater magnitude than the voltage of the source of control voltage, and the rectifier being so disposed that, during one half-cycle of the voltage of the source of alternating-current voltage, the voltage of the source of alternating-current voltage effects a substantially complete magnetic saturation of the magnetic core member, and during the next half-cycle of the voltage of the source of alternating-current voltage, said control voltage cooperates with the voltage of the source of alternating-current voltage to determine the magnitude of the reset-voltage across the primary winding and therefore the amount of resetting of the magnetic core member.

---

2,773,134
MAGNETIC AMPLIFIERS
Wallace J. Dunnet, Newtonville, Mass., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 25, 1954, Serial No. 432,134
9 Claims. (Cl. 179—171)

1. In a magnetic amplifier for supplying energy to a load, the combination comprising, a magnetic core member, a winding disposed in inductive relationship with the magnetic core member, a rectifier, means for connecting the load, the rectifier, and the winding in circuit relationship with one another, said circuit being connected to be energized by a main supply voltage, and a compensating circuit, the compensating circuit and the winding being energized by an auxiliary supply voltage, the auxiliary supply voltage being of greater magnitude than the main supply voltage, and the compensating circuit being so interconnected with the load, the rectifier, and with the winding that a back-voltage appears across the rectifier to thereby prevent exciting current from flowing through the load while the auxiliary supply voltage is effecting a substantially complete magnetic saturation of the magnetic core member.

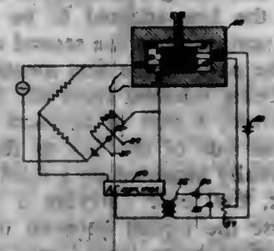
2,773,135
NEUTRALIZING CIRCUIT-ARRANGEMENT FOR AMPLIFYING HIGH-FREQUENCY OSCILLATIONS
Jacobus Johannes Reegen and Abraham Geertrudus Wilhelmus Uitjens, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application September 10, 1952, Serial No. 308,874
Claims priority, application Netherlands September 19, 1951
1 Claim. (Cl. 179—171)

An amplifier circuit comprising an electron tube containing two sections in a single envelope, each of said sections comprising a cathode, a control grid and an anode, said sections being positioned with respect to one another so that a parasitic capacitance occurs between said anodes, means connected to apply a signal to the control grid of a first one of said sections, a transformer having a primary winding connected at an end thereof to the anode of said first section and having a secondary winding connected to the control grid of the second one of said sections, an output circuit connected to the anode of said second section, a first capacitor connected at one terminal thereof to the remaining end of said primary winding and connected at the other terminal thereof jointly to said cathodes, and a second capacitor connected between the anode of said second tube and said remaining end of the primary winding and having a value of capacitance to neutralize said parasitic capacitance.

---

2,773,136
AMPLIFIER
Julius Futterman, New York, N. Y.
Application July 30, 1953, Serial No. 371,318
13 Claims. (Cl. 179—171)



1. A transformerless high fidelity low distortion amplifier system for a low impedance load comprising a first voltage amplifier stage having a single-ended input with one terminal grounded and one ungrounded terminal, said stage having a first tube with an anode, a cathode and a control electrode, a biasing arrangement connected directly to said cathode, said low impedance load being connected between said biasing arrangement and said grounded terminal, said control electrode being connected to said ungrounded terminal; a phase splitter stage comprising a second tube having an anode, a cathode and a control electrode, a first output impedance connected to said latter anode, a second output impedance connected to said latter cathode, said latter control electrode being directly conductively connected to said first tube anode, said cathode output impedance being connected to the junction of said first stage biasing arrangement and said load; a common source of plate supply potential for said first and second stages; a push-pull output stage comprising third and fourth tubes, each having a cathode, and anode and a control electrode, said third tube having its control electrode coupled to said second tube anode and having its cathode directly conductively connected to said fourth tube anode, the control electrode of said fourth tube being coupled to the cathode of said second tube; a source of plate supply potential for said third tube connected directly between said third tube anode and ground, a source of plate supply potential for said fourth tube connected between said fourth tube cathode and ground, the cathode of said third tube and the anode of said fourth tube being jointly connected to the said junction between said voltage amplifier stage biasing arrangement and said load, whereby said load carries the discharge current of all said tubes to provide negative feedback for said voltage amplifier stage and for said push-pull output stage and positive feedback for said phase splitter stage.

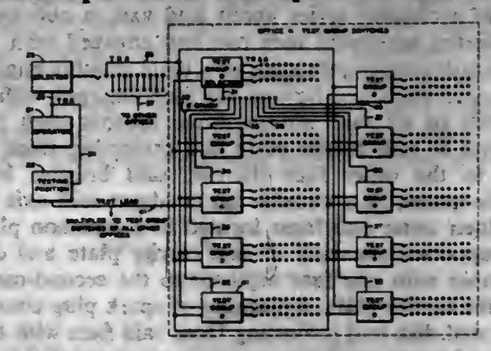
2,773,137
ELECTRIC AMPLIFIERS WITH NONLINEAR PIEZOIDS
Hans E. Hollmann, Oxnard, Calif.
Application November 8, 1951, Serial No. 255,507
3 Claims. (Cl. 179—171)
(Granted under Title 35, U. S. Code (1952), sec. 266)



2. In a piezoelectric amplifier, a bridge circuit having four arms, at least one of said arms including a piezoelectric dielectric capacitor, an alternating current source connected across said bridge circuit, means effective to connect an input voltage across all piezoelectric dielectric bridge arm capacitors, an alternating current amplifier connected to the bridge diagonals, means to rectify the output of said alternating current amplifier, a piezoelectric dielectric feedback capacitor mechanically coupled to each of said piezoelectric dielectric bridge arm capacitors, and means effective to impress said rectifier amplifier output across said feedback capacitor.

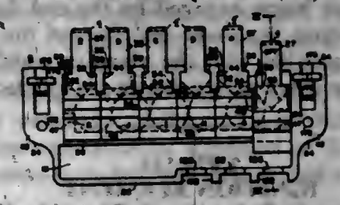
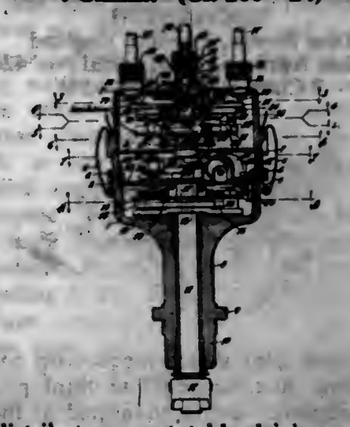
2,773,138
TELEPHONE LINE SELECTING SYSTEM
Frank Kessler, Los Angeles, Calif., assignor to General Dynamics Corporation, a Delaware corporation
Application November 17, 1955, Serial No. 547,440
8 Claims. (Cl. 179—175.2)



1. A telephone network including a plurality of groups of lines, connecting means for each group of lines, an input circuit for each connecting means, circuit means for connecting the input circuits of all of the connecting means in multiple, means controllable over said input circuits for causing only a predetermined one of said connecting means to operate, and means responsive to the operation of said predetermined connecting means for selecting one of said connecting means to thereafter be controllable over said input circuits to be operated to connect with a

line in the group of lines available to the selected connecting means.

---



2,773,139
SWITCH
Edward E. Forstrom, Fairfield, and William F. Allenby, Stratford, Conn., assignors to The Bryant Electric Company, Bridgeport, Conn., a corporation of Connecticut
Application November 4, 1952, Serial No. 318,708
18 Claims. (Cl. 200—5)

1. A switch comprising a formed switch casing, a plurality of push-button operating members arranged in a plurality of laterally adjacent rows, said push-button operating members being positioned in and extending through openings in said casing, interlocking means located between each of said rows of said push buttons having portions mechanically engageable by each of said push-button members adjacent thereto to confine the operation of all of said push-button members to a predetermined mode, a plurality of switches each including a stationary contact and a movable contact positioned in said casing member, each of said push-button members when depressed operating at least one of said switches.

2,773,140
CIRCUIT CONTROL APPARATUS FOR CONDENSER-DISCHARGE IGNITION SYSTEMS
Glen A. Guernsey and John C. Garea, West Springfield, and Arthur H. Green, East Longmeadow, Mass., assignors, by mesne assignments, to Globe-Union Inc., a corporation of Delaware
Application February 23, 1954, Serial No. 411,903
4 Claims. (Cl. 200—24)

1. In a distributor, a rotatable driving member having a face normal to its axis of revolution and three studs each

fixed at one end to said member and projecting from said face parallel to said axis, said studs being angularly-spaced in a circular series about said axis, a coil spring encompassing each stud with one end engaged with said face, a brush carrier consisting of a plate slidably engaged with all said studs and having one face engaged with the other ends of all said springs, three brushes each fixed at one end to said carrier plate and projecting from and normal to the other face thereof, said brushes being angularly-spaced in a circular series about said axis and having their outer end faces located in a common plane, a disk supported coaxially of said carrier plate and driving member with one face adjacent to the second-named face of the carrier plate, a plurality of spark plug contacts fixed to said disk and projecting from said face with their outer end faces located in a common plane parallel to the first-named plane, said contacts being equally-spaced in circular series about the axis of said disk, a distributor brush contact fixed at one end to the carrier plate and projecting from its second-named face, the outer end face of said brush contact being parallel to the first-named plane and adapted to successively move into confronting relation with the end faces of the spark plug contacts, and a circular track fixed to said face of said disk and having its outer face parrallel with the second-named plane, said track being engaged by the end faces of said brushes to position the outer end face of the distributor brush contact parallel with the plane in which the outer end faces of the spark plug contacts are located.

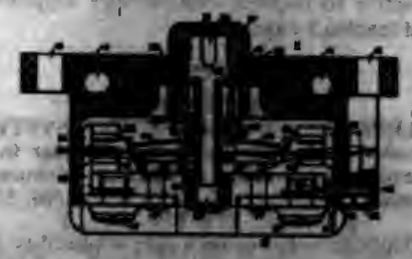
**CLOCKWORK CONTROLLED ELECTRIC SWITCH MECHANISM**
**Tom Bowen, London, England**
**Application April 13, 1954, Serial No. 424,189**
**7 Claims. (Cl. 200—38)**

1. A clock controlled switch mechanism comprising a clock mechanism, first, second and third pivoted lever arms, a first snap-over spring connected to the said first lever arm, a first switch operating member moving with said first snap-over spring, a cam rotatably adjustable on a driven shaft of the said clock mechanism and engaged by a part of the said second lever arm, spring means maintaining said part in engagement with said cam, a second snap-over spring connected to the said second lever arm, a second switch operating member moving with said second snap-over spring, a stop device connected to the said third lever arm and adapted to control the clock mechanism, a yielding detent for holding said stop device in its limiting positions, said third lever arm being formed with parts which are arranged in the path of movement of parts of the said first and second lever arms, and a manually controlled member adapted to engage said third lever arm.

---

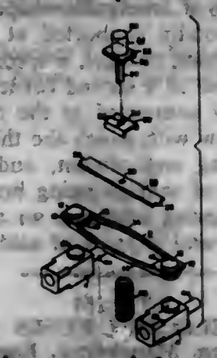


**2,773,143**
**TRACTOR IGNITION SYSTEM**
**James A. Morrison, Washington, Iowa**
**Application January 19, 1953, Serial No. 331,866**
**2 Claims. (Cl. 200—61.58)**

1. In a tractor having a seat, an electric circuit comprising switches, a plunger for operation of one of the switches, said switches comprising a box secured under the seat, a lever mounted on a side of the box, a link extending through the side of the box, a holding spring in the box, the link being connected to the spring, a second spring in the box adapted to be engaged by the first mentioned spring, when the second mentioned spring is flexed into the path of the first mentioned spring, the second spring being released from the first spring when the lever is moved, a pair of contacts mounted in the box on the same side of the box as the second spring, and a lever pivotally mounted on a third side of the box, within the box, the lever carrying a bridging contact which may close the circuit between the two contacts, the bridging contact being forced into engagement with the two contacts, when the second spring is released by operation of the first spring.

---

**2,773,144**
**SNAP ACTION SWITCH**
**Ralph B. Immel and Martin Wikell, Williamsville, N. Y., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania**
**Application April 30, 1953, Serial No. 352,096**
**9 Claims. (Cl. 200—67)**

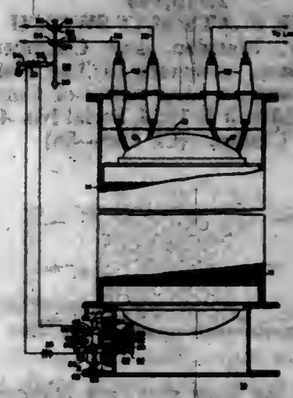


1. In a switch, in combination, a generally rectangular contact base of insulating material, a pair of spaced contact members disposed in line with one dimension of the base and secured to the base, an additional contact member disposed above and spaced from each one of the first-named contact members, said additional contact members being secured to the base, a bridging contact member

movable into and out of bridging engagement with said secured contact members, a reciprocating operating member having two oppositely disposed slots therein, a separately mounted substantially flat operating spring disposed in each slot in the operating member, substantially rigid toggle levers connecting said springs and said bridging contact member to actuate the latter, said bridging contact member having a generally rectangular opening therein for receiving the toggle levers, a guide pin disposed in the operating member between said springs, means extending from the guide pin for engaging the springs to retain them in the operating member, a cover for the switch, a recess in said base, and a bearing in said recess for the lower end of said guide pin, said bridging contact member being rotatable about said guide pin as an axis in a plane parallel to the contact base when the lower end of the guide pin is in said bearing and prior to the installation of the cover.

---

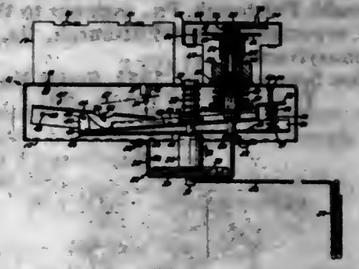
**2,773,145**
**SNAP ACTION SWITCH**
**Ralph B. Immel, Williamsville, N. Y., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania**
**Application July 19, 1954, Serial No. 443,997**
**7 Claims. (Cl. 200—67)**



1. A two position snap switch comprising two pairs of stationary contacts, electrical insulating means mounting the corresponding contacts of the respective pairs in spaced confronting relation, a movable contact bridge of electrical conducting spring metal having a pair of spaced contact platforms interconnected by a pair of flat oppositely bowed spring members the planes of which are substantially at right angles to the planes of the contact platforms, contacts mounted on said platforms, a flat actuating spring member bowed in a first position between the confronting edges of said platforms exerting forces thereon in opposition to those of said oppositely bowed flat spring members, a plunger slidably mounted in said electrical insulating means, and means on said plunger engaging said flat actuating spring member and positioning said movable contacts against one pair of said stationary contacts, movements of said plunger in a direction to reversely bow said actuating spring member from said first position causing said actuating spring member to move said movable contacts away from each other against the tension of said oppositely bowed flat spring members, reverse bowing of said actuating spring member being effective to drive said movable contact bridge in a direction to engage the contacts thereon with the remaining pair of stationary contacts.

---

**2,773,146**
**PRESSURE SWITCH**
**Louis E. Sauer, Sharon, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania**
**Application November 23, 1954, Serial No. 470,639**
**3 Claims. (Cl. 200—83)**



1. In combination, a receptacle containing a fluid under pressure, an arm pivoted about a predetermined pivot point, a switch having operating means for effecting an actuation of the switch, the switch being mounted on the pivoted arm for movement therewith, a mass also mounted on the pivoted arm for movement therewith, said mass being adjustable so that its distance from the pivot point can be varied, pressure responsive means including an actuating member disposed to engage and effect an actuation of said switch operating means, said actuating mem-

ber being responsive to the pressure of the fluid for actuating the switch in response to sudden changes in fluid pressure and for effecting bodily movement of the pivoted arm and switch, without actuating the switch, in response to gradual changes in the fluid pressure, and means for limiting the movement of the switch so that the said actuating member can effect an actuation of the switch when the fluid pressure reaches a predetermined value.

---

**2,773,147**
**LIMIT CONTROL**
**Albert L. Judson, Portland, Oreg., assignor to Iron Fireman Manufacturing Company, Portland, Oreg.**
**Application May 3, 1954, Serial No. 427,125**
**3 Claims. (Cl. 200—83)**

1. An alternative direct or reverse acting limit control comprising a frame, an electric switch secured on said frame, said switch having an open position and a closed position, a condition responsive means secured on said frame, an actuating lever for said switch, a pivot pin, said frame and said lever having a first set of bearings for said pivot pin formed thereon and a second set of bearings for said pivot pin formed thereon, said actuating lever being adapted when pivoted to said frame by said pin in either of said sets of bearings to rotate in the same direction about said pin to operate said switch to one of its said positions, a second lever, a third lever, means hinging one end of each of said second and third levers to said actuating lever at a point intermediate said first and said second bearing positions, the free ends of said second and third levers extending in the same direction from said hinging means, means resiliently biasing the free end of said second lever from the free end of said third lever, adjustable stop means carried on said frame, means adapting said adjustable stop means to limit the movement of said second and said third levers by said resilient biasing means, and means adapting said condition responsive means to rock said second and third lever about said ad-

justable stop means to rock said actuating lever at said hinging means about said pivot pin to actuate said switch between its open position and its closed position, said control being direct acting when said pivot pin is engaged in one of said sets of bearings and reverse acting when said pivot pin is engaged in the other of said sets of bearings.

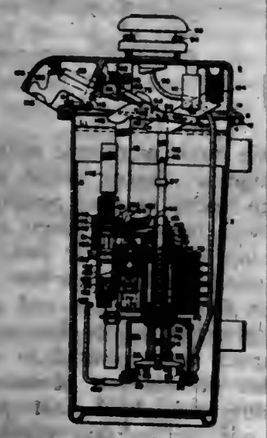
## FOUR PLATE MAT SWITCH

Sheldon S. Roby, Meriden, and Chamberlain Ferry, Kensington, Conn., assignors to The Stanley Works, New Britain, Conn., a corporation of Connecticut

Application March 4, 1954, Serial No. 414,024
6 Claims. (Cl. 200—86)

1. A switch of the floor mat type comprising a stack of four metal plates including a base plate and three superposed flexible plates adapted to be flexed together responsive to pressure thereon to effect electrical contact between at least two adjacent plates, and first, second and third sheets of non-conducting material respectively separating adjacent plates of said stack, each of said sheets having perforations defining a plurality of holes therein, said perforations in each sheet being laterally staggered relative to the perforations in the other sheets with each perforation in each sheet disposed in equilateral triangular and mutually overlapping relation with corresponding perforations in the other sheets.



---

2,773,149

## TEMPERATURE COMPENSATED RECLOSERS

Alert M. Opsahl, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application September 30, 1952, Serial No. 312,283
15 Claims. (Cl. 200—89)

8. In a circuit interrupter, separable contacts, dashpot means delaying movement of said contacts, and means venting said dashpot means including a thermostatic valve having a bushing with an axial bore and a threaded extension at one end, said bushing having an axial extension at the other end on one side of the bore and said bore having an enlarged portion defining a valve seat, a valve member disposed in said enlarged portion, a valve lifter slidably disposed in said bore, a shaft rotatably supported by the axial extension and projecting transversely of the bore, means operable to lock the shaft in different rotational positions, a cam rotatably mounted on said shaft to engage the lifter, and a spiral bimetallic operating member connecting the shaft and cam to effect rotation of the cam with changes in temperature.

## ELECTRIC SWITCHES AND CIRCUIT BREAKERS

Thomas Daniel Gey Wintle, Birmingham, England, assignor to J. A. Crabtree & Co. Limited, Walsall, England, a British company

Application February 19, 1954, Serial No. 411,494
Claims priority, application Great Britain February 26, 1953
14 Claims. (Cl. 200—116)

1. In an electric switch or circuit breaker provided with devices for tripping the switch or circuit breaker on overload, a lever actuated by such tripping mechanism, a swinging bracket of triangular shape carried on said lever, a toggle pivotally supported at one end on one corner of said swinging bracket, a second lever pivotally connected at one end to a second corner of said bracket, a trip bar pivotally connected at the other end of said second lever, a screw with which the third corner of said bracket has abutting engagement, and a spring coiled around one corner of said swinging bracket, the respective ends of said spring engaging an abutment on said bracket and the pivotal support of said second lever.

## ELECTRIC FUSES

Eric William Sugden, Manchester, England, assignor to Parmiter, Hope & Sugden Limited, Manchester, England

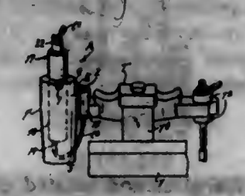
Application May 3, 1955, Serial No. 505,734
Claims priority, application Great Britain May 7, 1954
4 Claims. (Cl. 200—131)

1. An electric fuse comprising a cylindrical insulating cartridge casing, a single chamber within said casing, a number of strip-like fuse links arranged in parallel within said chamber, circular metal end caps on the ends of said casing, slits in each of said end caps whereby the ends of said fuse links are supported, said slits lying at an angle not exceeding 80° and substantially above 0° with respect to the radii of said end caps which pass through the mid-points of said slits, said angle being such that said fuse links are made to lie as far as possible from each other as is consistent with their being as far as possible from the inner surface of said casing.

---

2,773,152

## PROTECTIVE FUSE STRUCTURES FOR TRANSFORMERS



Peter W. Mueehong, St. Louis, Mo., assignor to Moloney Electric Company, St. Louis, Mo., a corporation of Delaware

Application June 18, 1952, Serial No. 294,223
7 Claims. (Cl. 200—133)

1. In a fuse-protected transformer, a terminal block affixed to said transformer and having a boss thereon, a

fuse assembly comprising a mounting bracket carrying a fuse, said bracket having an extension provided with an opening to receive said boss, a stud projecting from said boss and extending through said opening, a terminal lug electrically connected to said fuse by a conductor, said

terminal lug adapted for electrical and mechanical engagement with said stud, and a removable fastener for securing the terminal lug to the stud and securing the extension on said boss whereby the fuse assembly can be replaced as a unit by removal of said fastener.

---

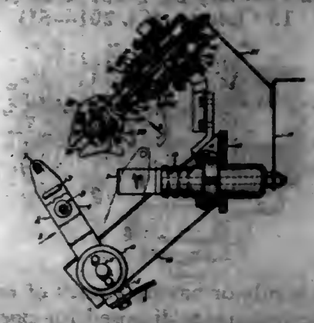
2,773,153

## TEMPERATURE-RESPONSIVE SWITCH MOUNTING AND INSTALLATION

Leo L. Verkuil, Norwalk, Conn., assignor to Edwards Company, Inc., Norwalk, Conn., a corporation of New York

Application October 3, 1955, Serial No. 538,140
8 Claims. (Cl. 200—138)

1. A thermostatic switch mounting means comprising a mounting plate having a relatively large round opening therein with threaded screw holes spaced therefrom and adapted to form a closure for an outlet box, a housing of insulating material having a front wall provided with an aperture surrounded by a collar, said collar having an outside diameter so that it is receivable in said mounting plate opening, a thermostatic switch structure supported within said housing and having a part comprising a bimetallic disk positioned to substantially close off said aperture at said collar, said switch structure having terminal connectors within said housing, said housing having a peripheral side wall and a rear closure plate of insulating material and removably associated therewith, said rear closure plate having a relatively large round opening therein that is smaller than the opening in said mounting plate and that is coaxial with said collar, said housing and rear closure plate having means forming spaced screw passages of the same spacing as the threaded holes in said mounting plate, and threaded screws to extend through said passages for threading into said threaded holes from the rear end of said housing with the front wall of the latter resting against the inside face of said mounting plate and said collar received in the mounting plate opening or from the front wall with said rear closure plate resting against the outside face of said mounting plate and with the smaller opening in said insulating rear closing plate substantially coaxial with the larger opening in said mounting plate to substantially peripherally insulate the latter opening for the passage of connecting conductors therethrough to said connecting terminals.



---

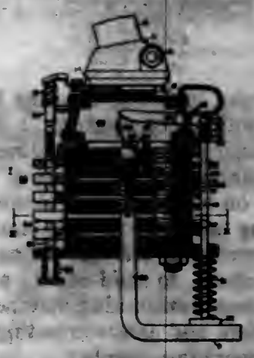
2,773,154

## ELECTRIC SWITCH

Ernest Williams, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York

Application September 19, 1955, Serial No. 535,150
3 Claims. (Cl. 200—146)

3. In an electrical apparatus comprising a main electrical switch and a switching duty shunt switch, mechanism for first closing said shunt switch as said main switch is actuated to closed position but before said main switch has reached closed position and then opening said shunt switch after said main switch has reached closed position comprising a pivotally mounted switch arm of said main switch, an outer end of said arm movable through an arc as said arm is pivoted, a pivotally mounted cam having a notch formed in a peripheral edge portion thereof, a portion of said notch disposed in said arc and adapted to receive a portion of said arm outer end as said arm is pivoted to cause pivotal movement of said cam, a pair of spaced concave surfaces formed in another peripheral edge portion of said cam separated by a convex surface of said another peripheral edge portion, and a cam follower engageable with said concave and convex surfaces for imparting closing and opening movement to a movable contact member of said shunt switch as said arm is pivoted from open to closed position.



---

2,773,155

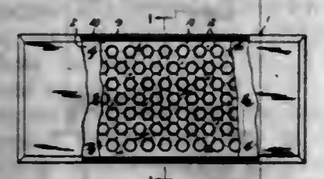
## CIRCUIT INTERRUPTER

Robert E. Friedrich, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application November 27, 1953, Serial No. 394,578
15 Claims. (Cl. 200—150)

1. A circuit interrupter of the fluid-blast type including separable contact means for establishing an arc, a first venting means, means for sending a flow of fluid against the arc and out the first venting means, auxiliary second venting means, valve structure normally closing the second venting means, and electromagnetic means responsive to the average value of the current passing through the interrupter during the period the contact means is separating to effect opening of the valve structure at a predetermined average current magnitude during the time the arc is established.

justable stop means to rock said actuating lever at said hinging means about said pivot pin to actuate said switch between its open position and its closed position, said control being direct acting when said pivot pin is engaged in one of said sets of bearings and reverse acting when said pivot pin is engaged in the other of said sets of bearings.



---

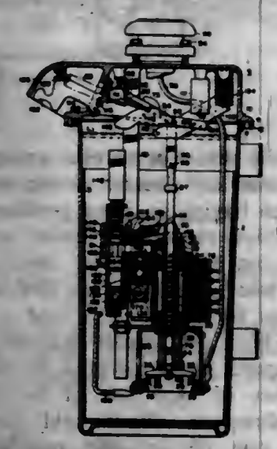
2,773,148

## FOUR PLATE MAT SWITCH

Sheldon S. Roby, Meriden, and Chamberlain Ferry, Kensington, Conn., assignors to The Stanley Works, New Britain, Conn., a corporation of Connecticut

Application March 4, 1954, Serial No. 414,024
6 Claims. (Cl. 200—86)

1. A switch of the floor mat type comprising a stack of four metal plates including a base plate and three superposed flexible plates adapted to be flexed together responsive to pressure thereon to effect electrical contact between at least two adjacent plates, and first, second and third sheets of non-conducting material respectively separating adjacent plates of said stack, each of said sheets having perforations defining a plurality of holes therein, said perforations in each sheet being laterally staggered relative to the perforations in the other sheets with each perforation in each sheet disposed in equilateral triangular and mutually overlapping relation with corresponding perforations in the other sheets.



---

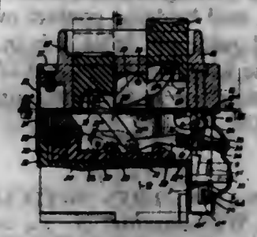
2,773,149

## TEMPERATURE COMPENSATED RECLOSERS

Alert M. Opsahl, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application September 30, 1952, Serial No. 312,283
15 Claims. (Cl. 200—89)

8. In a circuit interrupter, separable contacts, dashpot means delaying movement of said contacts, and means venting said dashpot means including a thermostatic valve having a bushing with an axial bore and a threaded extension at one end, said bushing having an axial extension at the other end on one side of the bore and said bore having an enlarged portion defining a valve seat, a valve member disposed in said enlarged portion, a valve lifter slidably disposed in said bore, a shaft rotatably supported by the axial extension and projecting transversely of the bore, means operable to lock the shaft in different rotational positions, a cam rotatably mounted on said shaft to engage the lifter, and a spiral bimetallic operating member connecting the shaft and cam to effect rotation of the cam with changes in temperature.



---

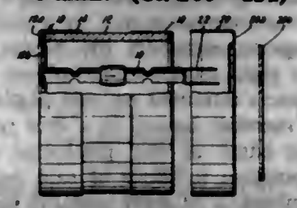
2,773,150

## ELECTRIC SWITCHES AND CIRCUIT BREAKERS

Thomas Daniel Guy Windle, Birmingham, England, assignor to J. A. Crabtree & Co. Limited, Walsall, England, a British company

Application February 19, 1954, Serial No. 411,494
Claims priority, application Great Britain February 26, 1953
14 Claims. (Cl. 200—116)

1. In an electric switch or circuit breaker provided with devices for tripping the switch or circuit breaker on overload, a lever actuated by such tripping mechanism, a swinging bracket of triangular shape carried on said lever, a toggle pivotally supported at one end on one corner of said swinging bracket, a second lever pivotally connected at one end to a second corner of said bracket, a trip bar pivotally connected at the other end of said second lever, a screw with which the third corner of said bracket has abutting engagement, and a spring coiled around one corner of said swinging bracket, the respective ends of said spring engaging an abutment on said bracket and the pivotal support of said second lever.



---

2,773,151

## ELECTRIC FUSES

Eric William Sugden, Manchester, England, assignor to Parmiter, Hope & Sugden Limited, Manchester, England

Application May 3, 1955, Serial No. 505,734
Claims priority, application Great Britain May 7, 1954
4 Claims. (Cl. 200—131)

1. An electric fuse comprising a cylindrical insulating cartridge casing, a single chamber within said casing, a number of strip-like fuse links arranged in parallel within said chamber, circular metal end caps on the ends of said casing, slits in each of said end caps whereby the ends of said fuse links are supported, said slits lying at an angle not exceeding 80° and substantially above 0° with respect to the radii of said end caps which pass through the mid-points of said slits, said angle being such that said fuse links are made to lie as far as possible from each other as is consistent with their being as far as possible from the inner surface of said casing.

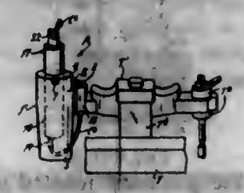
2,773,152

## PROTECTIVE FUSE STRUCTURES FOR TRANSFORMERS



Peter W. Muschong, St. Louis, Mo., assignor to Moloney Electric Company, St. Louis, Mo., a corporation of Delaware

Application June 18, 1952, Serial No. 294,223
7 Claims. (Cl. 200—133)

1. In a fuse-protected transformer, a terminal block affixed to said transformer and having a boss thereon, a

fuse assembly comprising a mounting bracket carrying a fuse, said bracket having an extension provided with an opening to receive said boss, a stud projecting from said boss and extending through said opening, a terminal lug electrically connected to said fuse by a conductor, said

terminal lug adapted for electrical and mechanical engagement with said stud, and a removable fastener for securing the terminal lug to the stud and securing the extension on said boss whereby the fuse assembly can be replaced as a unit by removal of said fastener.

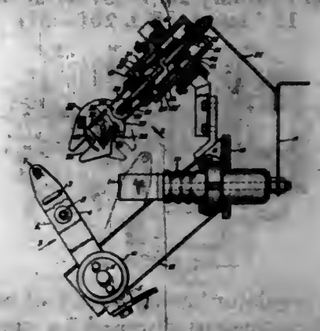
---

2,773,153

## TEMPERATURE-RESPONSIVE SWITCH MOUNTING AND INSTALLATION

Leo L. Verkuil, Norwalk, Conn., assignor to Edwards Company, Inc., Norwalk, Conn., a corporation of New York

Application October 3, 1955, Serial No. 538,140
8 Claims. (Cl. 200—138)



1. A thermostatic switch mounting means comprising a mounting plate having a relatively large round opening therein with threaded screw holes spaced therefrom and adapted to form a closure for an outlet box, a housing of insulating material having a front wall provided with an aperture surrounded by a collar, said collar having an outside diameter so that it is receivable in said mounting plate opening, a thermostatic switch structure supported within said housing and having a part comprising a bimetallic disk positioned to substantially close off said aperture at said collar, said switch structure having terminal connectors within said housing, said housing having a peripheral side wall and a rear closure plate of insulating material and removably associated therewith, said rear closure plate having a relatively large round opening therein that is smaller than the opening in said mounting plate and that is coaxial with said collar, said housing and rear closure plate having means forming spaced screw passages of the same spacing as the threaded holes in said mounting plate, and threaded screws to extend through said passages for threading into said threaded holes from the rear end of said housing with the front wall of the latter resting against the inside face of said mounting plate and said collar received in the mounting plate opening or from the front wall with said rear closure plate resting against the outside face of said mounting plate and with the smaller opening in said insulating rear closing plate substantially coaxial with the larger opening in said mounting plate to substantially peripherally insulate the latter opening for the passage of connecting conductors therethrough to said connecting terminals.

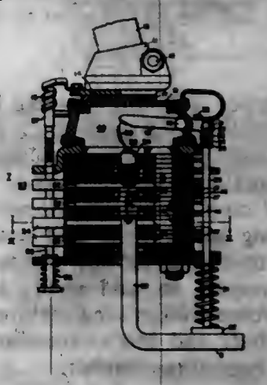
2,773,154

## ELECTRIC SWITCH

Ernest Williams, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York

Application September 19, 1955, Serial No. 535,150
3 Claims. (Cl. 200—146)

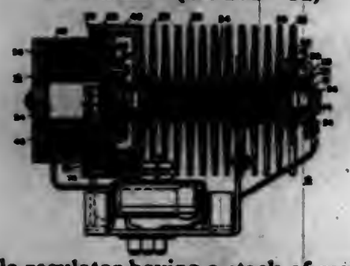
3. In an electrical apparatus comprising a main electrical switch and a switching duty shunt switch, mechanism for first closing said shunt switch as said main switch is actuated to closed position but before said main switch has reached closed position and then opening said shunt switch after said main switch has reached closed position comprising a pivotally mounted switch arm of said main switch, an outer end of said arm movable through an arc as said arm is pivoted, a pivotally mounted cam having a notch formed in a peripheral edge portion thereof, a portion of said notch disposed in said arc and adapted to receive a portion of said arm outer end as said arm is pivoted to cause pivotal movement of said cam, a pair of spaced concave surfaces formed in another peripheral edge portion of said cam separated by a convex surface of said another peripheral edge portion, and a cam follower engageable with said concave and convex surfaces for imparting closing and opening movement to a movable contact member of said shunt switch as said arm is pivoted from open to closed position.



---

2,773,155

## CIRCUIT INTERRUPTER



Robert E. Friedrich, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application November 27, 1953, Serial No. 394,578
15 Claims. (Cl. 200—150)

1. A circuit interrupter of the fluid-blast type including separable contact means for establishing an arc, a first venting means, means for sending a flow of fluid against the arc and out the first venting means, auxiliary second venting means, valve structure normally closing the second venting means, and electromagnetic means responsive to the average value of the current passing through the interrupter during the period the contact means is separating to effect opening of the valve structure at a predetermined average current magnitude during the time the arc is established.

2,773,156
ELECTRIC REGULATOR
Lewis R. Lowry, Jr., and Harrison H. C. Richards, Jr., Lima, Ohio, assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application February 26, 1953, Serial No. 338,986
13 Claims. (Cl. 201—51)

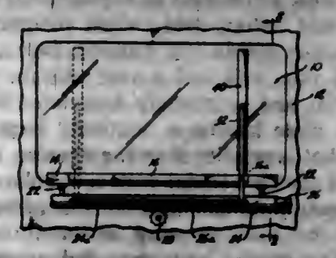
1. In a pile regulator having a stack of resistance material and an electromagnet disposed for operation to control the pressure applied to the stack, the combination comprising, a core member for the electro-magnet, a support member carried by the electromagnet, the support member having a ridge disposed thereon, an armature member for the electromagnet disposed in magnetic relationship with the core member, a spring member disposed to have a linear force-deflection characteristic and disposed to be carried by the armature member, the spring member extending outwardly beyond the periphery of the armature member to seat on the ridge of the support member and make substantially line contact engagement therewith so that on movement of the armature member the spring member pivots about the ridge, and a holding member carried by the armature member disposed in seating engagement with the spring member intermediate opposite ends thereof to maintain the spring member positioned between the armature member and the holding member.

2,773,157
CONTROL DEVICE
Chester S. Ingraham, East Aurora, N. Y., assignor to Sylvania Electric Products Inc., a corporation of Massachusetts
Application May 8, 1953, Serial No. 353,728
5 Claims. (Cl. 201—55)

1. A control device including a casing having at least two parallel walls with alined apertures, a shaft traversing said casing and passing through the alined apertures, a pair of contacts within said casing one of which is movable and mounted on a leaf spring extending toward the shaft, an operating member in said casing, said pair of contacts and operating member being diametrically positioned with respect to said shaft, and means including a bowed force transmitting member partially encompassing the shaft and interconnecting the movable contact with the operating member.

2,773,158
HOUSING STRUCTURE FOR PHOTOCELL OR THE LIKE AND METHOD OF MAKING THE SAME
Thomas E. Myers, Batavia, Ill., assignor to Electrol Laboratory & Sales Co., Cape Girardeau, Mo., a corporation of Missouri
Application January 27, 1953, Serial No. 333,493
10 Claims. (Cl. 201—63)

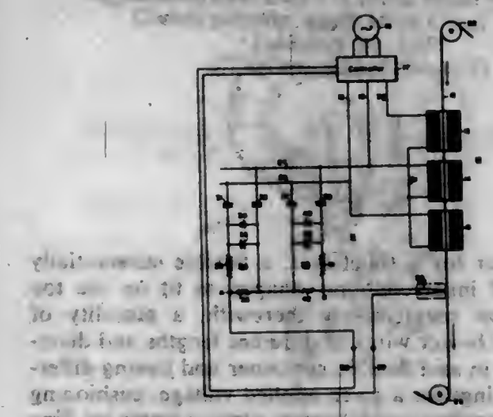
1. A housing for a sensing resistance comprising in combination: a cup-like member having a pair of spaced holes in its bottom and defining an annular seat adjacent its lip; a glass plate seated on the seat and having a pair of conducting rods extending inwardly of the cup-like member and through the holes; a sensing resistance on



the inner face of the glass and located generally between the rods; beads of conducting adhesive extending along the inner face of the glass from the rods to the ends of the resistance, respectively; and a plastic filling within the housing and filling substantially the entire space therein.

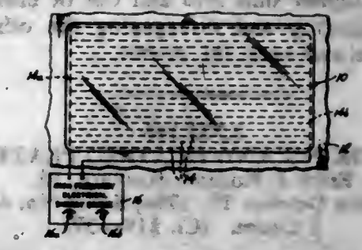
2,773,159
WIRE-WOUND RESISTANCE UNITS
Robert W. Taggart, Indianapolis, Ind.
Application September 30, 1954, Serial No. 459,560
5 Claims. (Cl. 201—63)
(Granted under Title 35, U. S. Code (1952), sec. 266)

2. A resistor unit comprising, a resistor form of heat-resistant dielectric material having an intermediate portion between two end flanges, relatively heavy wire prongs molded integral therein and disposed in parallel relation and extending outwardly through said end flanges, relatively light resistance wire wrapped around said intermediate portion, a means at each end of said resistor form for connecting said relatively light resistance wire to said relatively heavy wire prongs, and a means on each said end flanges for mounting said resistor unit so as to minimize rotational motion.



2,773,160
WINDOW ANTI-ICING DEVICES
Robert L. Campbell, Seattle, and Stanley E. Rea, near Kent, Wash., assignors to Boeing Airplane Company, Seattle, Wash., a corporation of Delaware
Application January 11, 1954, Serial No. 403,244
4 Claims. (Cl. 219—10.73)

1. A window anti-icing device comprising, in combination with a window of dielectric material, an elongated narrow electrical conductor of a length to span across one dimension of a window area to be heated for anti-icing purposes, means mounting said conductor closely adjacent and parallel to one window surface with the length of said conductor extending across said window area as aforementioned, means for moving said conductor reciprocatively generally transversely of its length back and forth across said area, a second electrical conductor, said second electrical conductor being positioned closely adjacent said window in spaced generally parallel relation to said first conductor whereby application of high frequency voltage to said conductors produces an electric field therebetween passing through the window material, and a source of high frequency electrical energy having opposite terminals connected respectively to said conductors and having an operating frequency and output voltage sufficient to heat the window to effective anti-icing temperature during continued reciprocative movement of said first conductor.

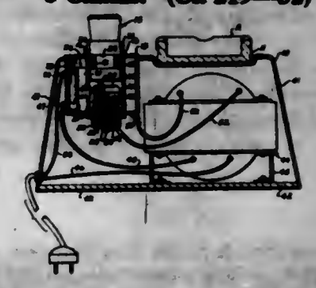


2,773,161
COMBINATION CONTROL SYSTEM FOR CONTINUOUS HEAT TREATMENT
Robert M. Baker, Catonsville, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 25, 1954, Serial No. 432,115
7 Claims. (Cl. 219—10.77)

1. In apparatus for the heat treatment of moving metallic strip and operable with a power supply providing an output voltage and having a control member, the combination of an induction heating member adapted to be connected to said power supply to receive said output voltage, a control circuit connected between said induction heating member and said control member, said control circuit comprising a temperature detector element and first and second control networks, said temperature detector element providing an output signal responsive to the temperature of the moving strip, said first control network having a first time constant and being connected to said power supply to be responsive to variations in said output voltage to provide a first control voltage, said second control network having a second time constant and being connected to said power supply to be responsive to variations in said output voltage to provide a second control voltage, with said first and second control networks being connected to said temperature detector element such that said output signal is combined with said first and second control voltages for controlling the temperature of said strip.

2,773,162
ANTI-ICING OF WINDOWS BY DIELECTRIC HEATING
Orland M. Christensen, Edmonds, Wash., assignor to Boeing Airplane Company, Seattle, Wash., a corporation of Delaware
Application January 14, 1954, Serial No. 404,045
7 Claims. (Cl. 219—10.81)

1. Window anti-icing means comprising, in combination with a window of dielectric material, a plurality of elongated conductors incorporated within said window and spaced apart in substantially parallel relationship to form an electrode grid occupying a general plane substantially parallel to an exposed surface of said window, said grid extending over a window area to be heated for anti-icing purposes, said grid conductors being formed and arranged to set up dielectric lines of force therebetween fringing outwardly from said general plane and extending along said exposed window surface when voltage is applied with alternately opposite polarity to successively adjacent conductors in said grid, a source of high frequency electrical energy having output terminals, and means con-



necting said conductors to said source terminals with successively adjacent conductors in said grid having opposite polarity, the frequency and voltage of said energy source being sufficient to heat the window dielectrically to anti-icing temperature along the exposed surface area thereof.

2,773,163
HEATABLE ENGRAVING STYLUS ASSEMBLY
John A. Boyajean, Huntington, N. Y., assignor to Fairchild Camera and Instrument Corporation, a corporation of Delaware
Application September 28, 1953, Serial No. 382,821
4 Claims. (Cl. 219—29)

1. A heatable stylus assembly for engraving a plate of thermally deformable material comprising: a metallic shaft having a cylindrical portion terminating in a pyramidal tapered deforming tip and having a longitudinal slot extending into said tapered tip and having a tapered end complementary to the tapered tip and reducing the cross section thereof to a substantially uniform thickness of the order of 1/10 that of the slotted cylindrical portion; and means for causing an electric current to flow through the shaft and through said slotted tapered tip thereof, whereby the heat generated by current flow is concentrated in said slotted tapered tip.

2,773,164
CIGAR AND CIGARETTE LIGHTER
Lawrence W. Bushin, Charlotte, N. C.
Application June 11, 1954, Serial No. 436,163
5 Claims. (Cl. 219—32)

5. In an electric lighter having a receptacle adapted to receive a lighter unit provided with a heating element and adapted to be moved into and out of energizing position, a switch associated with the lighter unit and arranged in circuit therewith, said switch comprising a lever bumper extending parallel to and in engagement with the outer surface of the receptacle, a projection on

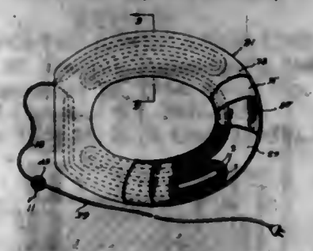
said lever bumper extending through the wall of the receptacle into the path of the lighter unit, a spring member normally maintaining the lever bumper projection in the path of the lighter unit, a pair of opposed contacts and one of said contacts being carried by said lever bumper adjacent one end thereof and responsive to movement of the lighter unit into and out of energizing position for engaging and disengaging the other contact point to close and open the circuit.

---

**2,773,165**
**COOKING AND HEATING PLATES**
**Erich J. Konrad, Harvard, Ill.**
**Application October 29, 1954, Serial No. 465,493**
**1 Claim. (Cl. 219—37)**

A cooking and heating plate assembly for a stove or range having a stationary stove housing, including a rotatably mounted disk occupying at least a portion of the upper part of the stove and having a plurality of openings, heating plates with heating units located individually in said openings and capable of individually being brought to the fore part of the stove by manually rotating the disk at will, means for supplying heating medium to the heating units, means for controlling said medium supplied to any heating unit and heating plate upon said disk, said stove housing having a casing mounted in the upper portion thereof with a bottom therein, an upright post pivotally mounted upon the bottom for guiding and supporting the disk in rotation, a plurality of radial arms beneath the disk having rollers therebetween rolling upon said bottom distant from the post to support the disk in all rotated positions, a rim upon the disk periphery with hand holds recessed into its edge, said post having a cylinder surrounding it and provided with commutator rings connected to the heating units on the disk, and movable contact brushes connected to a current supply in contact with the rings and with switches controlling the brushes.

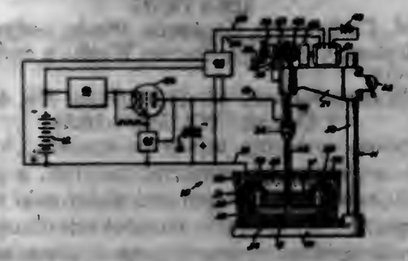
---



**2,773,166**
**COFFEE PERCOLATOR**
**Fredric Lafargue Best, Felixstowe, England, assignor of one-half to Best Products Limited, Felixstowe, England, a British company**
**Application April 30, 1954, Serial No. 426,798**
**Claims priority, application Great Britain April 23, 1954**
**3 Claims. (Cl. 219—44)**

1. In a coffee-percolator, the combination of a liquid-containing vessel, an electrical immersion heater element comprising a resistance in two sections, a heat-conductive tubular casing having a closed end in contact with said heater element, a shaft rotatable in said casing, a fusible alloy in said casing normally holding said shaft stationary, an arm rotatable on said shaft, a one-way clutch adapted to engage said arm with said shaft, a spring tending to rotate said arm and clutch and shaft, a first normally closed switch controlling the supply of current to said percolator operatively connected to said arm and operable automatically to interrupt the current by said spring moving said arm when said fusible alloy is melted, and operable in the opposite direction, by manual movement of said arm, a second normally closed switch controlling the current in one section of said resistance in said heater element, thermally actuated means adapted to open said switch on a rise of temperature, said actuating means being adjustable to select the temperature at which it operates to be lower than the melting point of said fusible alloy.

---

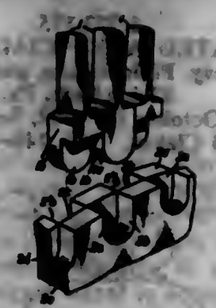


**2,773,167**
**COMMODE SEAT HEATING PAD**
**Richard Jerry Arbaugh, Iowa, La.**
**Application February 4, 1954, Serial No. 406,214**
**2 Claims. (Cl. 219—46)**

1. In a cover for a toilet seat, a flexible substantially moisture-proof inner container shaped to fit on the top of a toilet seat coextensively therewith, a plurality of spirally wound heater wires of different lengths and diameters mounted in said flexible container and having different heating ratings for a given applied voltage, cushioning material surrounding said heater wires, a pair of line conductors, a selector switch connected between said line conductors and said heater wires and being formed and arranged to selectively connect said heater wires to said line conductors, an outer cover overlying said inner container, said outer cover comprising a single piece of flexible material generally conforming in shape to said inner container but having a width substantially greater than that of said inner container and extending on opposite sides of said inner container substantial distances so that its marginal portions may be folded under a toilet seat on which said inner container is mounted, and spaced grommets in the opposite edge portions of said outer cover adapted to receive a fastening cord, whereby such fastening cord may secure the outer cover around the inner container and the toilet seat by being engaged alternately through the grommets of said opposite edge portions, and may be tied at its ends.

---

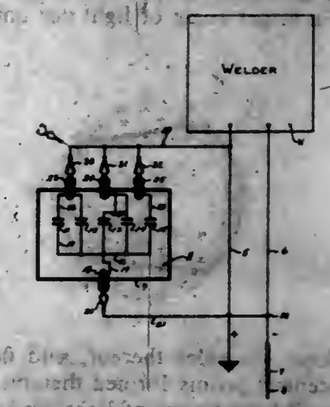
**2,773,168**
**HIGH-SPEED SPARK MACHINING APPARATUS**
**Everard M. Williams, Pittsburgh, Pa., assignor to Firth Sterling Inc., Pittsburgh, Pa., a corporation of Pennsylvania**
**Application January 22, 1953, Serial No. 332,621**
**9 Claims. (Cl. 219—69)**



7. In a spark cutting apparatus for dislodging particles from a conductive workpiece by repetitive time-spaced sparks through an ionizable dielectric medium in the spark gap defined between the workpiece and an electrode tool, means for connecting the spark gap directly across a capacitive energy storage means, a charging circuit including a series connected switching means therein connecting said capacitive storage means to an electrical power source, said switching means being responsive to the charged condition of said capacitive storage means to open said charging circuit, and means responsive to the discharging of the capacitive storage means for closing said switch a delay interval thereafter to permit deionization of said spark gap.

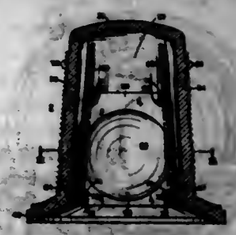
---

**2,773,169**
**WELDING OF BLADED ROTORS FOR TURBINES, COMPRESSORS, ETC.**
**George Lees, Leicester, England, assignor to Power Jets (Research and Development) Limited, London, England, a British company**
**Application February 18, 1952, Serial No. 272,001**
**Claims priority, application Great Britain February 26, 1951**
**3 Claims. (Cl. 219—117)**



1. A method of constructing a turbine-bladed rotor by welding a ring of blades around the rim of the rotor which consists in first forming the rotor with a plurality of recesses therearound extending inwards from one end face and extending to the periphery of the rotor, alternating with like recesses extending inwards from the other end face, and forming the blade roots with steps to provide faces thereon complementary to the faces at the bottom of each recess, these complementary faces lying in planes which are transverse to the direction of the rotor axis, then placing a blade in one of said recesses in one end face, heating the now opposed complementary faces by arcing or sparking resulting from the passage of electric current from one to the other, with pressure applied to weld said opposed complementary faces together, and repeating this operation with another blade in the next recess in said one end face and so on until half of the blades (i. e. the first, third, fifth etc.) have been welded to the rotor, and finally repeating the sequence with the second, fourth, sixth and remaining blades in the recesses on the other end face of the rotor.

---



**2,773,170**
**ATTACHMENT FOR WELDING MACHINES**
**Julius A. Barthel, Milwaukee, Wis.**
**Application November 19, 1953, Serial No. 393,159**
**1 Claim. (Cl. 219—131)**

An attachment for an electric welding machine to stabilize the welding arc comprising a case, a plurality of capacitors of a predetermined definite capacity disposed in said case, a negative binding post carried by said case and extending outwardly therefrom, means electrically connecting the negative terminals of all of the capacitors to the binding post, a plurality of positive terminals carried by the case and extending outwardly therefrom, means electrically connecting certain capacitors to certain terminals, positive and negative conductor wires for connection with the positive and negative leads of the welding machine, a clamp for the conductor for the negative lead detachably engaging the negative binding post, and a plurality of clamps electrically connected with the conductor wire for the positive lead for selective engagement with the terminals for bringing one or more capacitors into use.

---

**2,773,171**
**LUMINAIRE**
**Willis A. Pomow, Cleveland, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania**
**Application April 26, 1952, Serial No. 284,562**
**8 Claims. (Cl. 240—1.2)**

3. A luminaire comprising, a support, means on said support for receiving a light source, a lens also mounted on said support at a predetermined position relative to said source receiving means, said lens having spaced integral projecting ribs on its inner surface extending away from one edge of the lens in substantially the same direction, an auxiliary light controlling element having yieldable portions at least at opposite sides thereof extending toward said ribs, respectively, said yieldable portions having the free ends thereof spaced apart a greater distance than the distance between the inner sides of said ribs at least at the operative position of said element, so that the yieldable portions are adapted to be inserted between said ribs at said one edge of the lens and moved longitudinally of the ribs inwardly to the operative position of said element where its yieldable portions engage inner sides of said ribs under stress to definitely locate said element in a direction relative to said lens transverse to said ribs, while permitting removal of said element by merely withdrawing it longitudinally of the ribs from said one edge of the lens.

---

**2,773,172**
**LIGHTING UNIT**
**Willis A. Pomow, Cleveland, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania**
**Application August 25, 1951, Serial No. 243,672**
**15 Claims. (Cl. 240—1.2)**

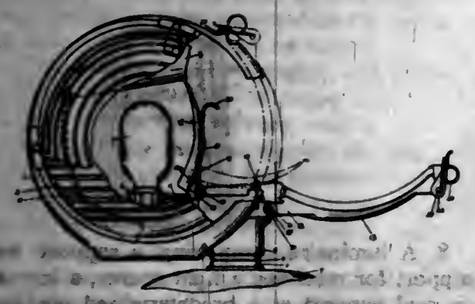
1. A lighting unit comprising a light source, a one-piece tubular transparent lens surrounding said light source and comprising substantially opposed flat lens portions and intermediate curved lens portions connecting

said flat lens portions at opposite sides, respectively, said

relative to said housing, lead-in wires, and a filament hav-

to derive a D.-C. control voltage in accordance with said

tuning shaft, a radial bracket secured to said actuating



said flat lens portions at opposite sides, respectively, said flat lens portions comprising chordal portions with respect to said curved lens portions so as to be closer to the light source than a cylindrical portion subtended thereby, to thus accept a larger angle of light per unit of area at all

points between the sides thereof, said flat lens portions having concentric prisms formed thereon so as to project opposed pencil type beams of light, and said curved lens portions having non-circular prisms formed on both inner and outer surfaces thereof to transmit light therethrough in a different manner.

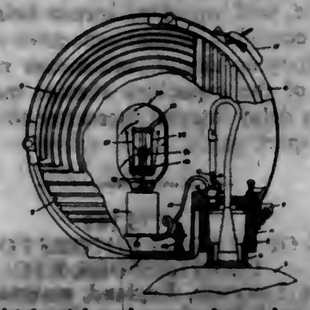
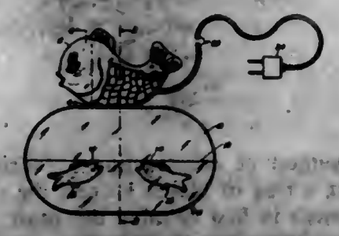
2,773,173
LIGHT PROJECTOR
Philip R. Clark, South Milwaukee, and Joseph G. Atwood, Wauwatosa, Wis., assignors to McGraw Electric Company, Milwaukee, Wis., a corporation of Delaware
Application June 15, 1953, Serial No. 361,706
4 Claims. (Cl. 240—1.2)



1. In a light projector comprising a housing having a lens-receiving opening, a lens positioned in said opening and a projector lamp having a longitudinal axis therethrough; said housing defining an access opening therein, a removable closure for said access opening, a pivotally mounted reflector for said lamp positioned intermediate said lamp and said access opening, the axis of rotation of said pivotally mounted reflector being substantially normal to said longitudinal axis of said projector lamp, said reflector being pivotally movable from a normal reflecting position relative to said lamp axis to a second operating position, said reflector and said closure being in spaced apart relationship and each being independently movable relative to one another, whereby said reflector may be pivotally rocked to said second position and said closure may be removed to open position to permit manual access to the interior of said housing with said lens remaining undisturbed in normal operating position.

---

2,773,174
LIGHT PROJECTOR
Harry V. Leide, East Stroudsburg, Pa., assignor to McGraw Electric Company, Milwaukee, Wis., a corporation of Delaware
Application November 19, 1952, Serial No. 321,447
16 Claims. (Cl. 240—1.2)



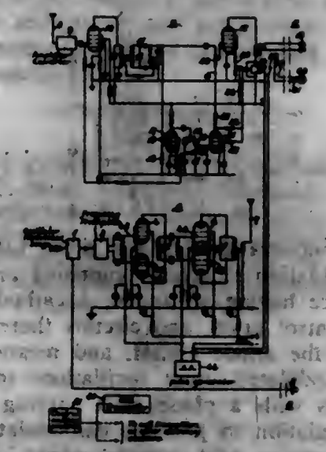
1. A contact or runway light projector comprising a housing, a lens having a focal axis and being mounted on said housing, and a light source for said projector comprising a light transmitting envelope in fixed position relative to said housing, lead-in wires, and a filament having supports projecting therefrom and being supported in a predetermined position relative to the focal axis of said lens, said filament being arranged for electrical con-

nection with said lead-in wires, and a prime mover being operatively associated with said filament to move said filament relative to said focal axis responsive to the quantity of energy supplied to said prime mover.

---

2,773,175
ILLUMINATED ARTIFICIAL AQUARIUM
Richard A. Levy, Philadelphia, and Charles J. Levy, Elkins Park, Pa.
Application October 15, 1952, Serial No. 314,926
3 Claims. (Cl. 240—10)

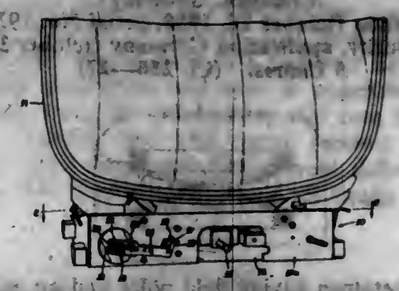
1. An illuminated artificial aquarium comprised by a tank of two mating sections of transparent material with flanges thereon adapted to be positioned in edge to edge relation and having flat surfaces adapted to form the top of the tank, a hollow opaque body simulating a fish having a flat bottom section mounted on the top of the tank, and upwardly curved sections on either side of said flat bottom section with holes therein, and a lamp within said hollow opaque body for radiating light to the tank through said holes.



---

2,773,176
RADIO COMMUNICATION SYSTEM
Dirk Johan Bruin, Louis Francois Lietz, and Cornelis Roosjen, Hilversum, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application October 21, 1950, Serial No. 191,428
Claims priority, application Netherlands October 22, 1949
5 Claims. (Cl. 250—6)

1. A radio system for communication via a plurality of dual frequency channels comprising a principal transceiver station provided with a transmitting section including means to generate a carrier wave corresponding in frequency to one frequency in one of said channels, a clearing signal generator means selectively to modulate in one condition said carrier wave in said transmitting section with an intelligence signal to be transmitted and in another condition with said clearing signal, and a receiving section including means to detect incoming noise signals and coupled to the clearing signal generator in said transmitting section to cut-off said clearing signal when the detected noise signals fall below a predetermined amplitude, said means to detect incoming noise signals comprising a rectifier, a filter connected to feed said noise signals to said rectifier and exclude other signals, and a load impedance connected to said rectifier



to derive a D.-C. control voltage in accordance with said noise signals, said clearing signal generator being controlled by said control voltage, means responsive to an intercepted carrier wave whose frequency corresponds to the other frequency in said one channel to actuate the selective means in said transmitting section to transfer the same from said other condition to said one condition; a group of auxiliary transceivers each having a

transmitting section including means selectively to transmit one carrier wave from a plurality of carrier waves whose frequencies correspond respectively to said other frequencies in said plurality of channels, and a receiving section including means responsive to a carrier wave modulated by said clearing signal to actuate the selective means in the transmitting section for effecting transmission on the other frequency in the channel containing said clearing signal modulated carrier wave.

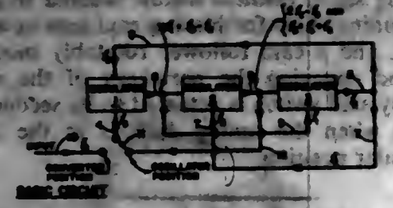
2,773,177
CONVERTER MECHANISM FOR TV RECEIVER
Roy White, Wheaton, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois
Application December 26, 1952, Serial No. 328,048
3 Claims. (Cl. 250—16)

1. In a television receiver for receiving television signals in two distinct frequency ranges and which includes a front panel, a tuning device for selectively tuning the receiver to different television signal channels in a first frequency range, and a tuning shaft for actuating said tuning device extending through the front panel, the combination of a disc-like cam secured to the tuning shaft having a notched peripheral portion corresponding to a selected angular position of said shaft, a converting device for enabling the receiver to utilize television signals in a second frequency range and for selectively tuning the receiver to such signals, a rotary switch having a first operating position in which said converting device is rendered inoperative and having a second operating position in which said converting device is rendered operative, an actuating shaft for said switch extending through the aforesaid front panel parallel to but spaced from said tuning shaft, a radial bracket secured to said actuating shaft, an arm having one end pivoted to said bracket and having a bifurcated portion at its other end embracing the tuning shaft, resilient means secured to said arm and to the tuning shaft for biasing said arm towards the tuning shaft, and a cam follower rotatably mounted on said arm and engaging the periphery of the aforesaid cam, whereby said switch is actuated to its second operating position when the tuning shaft is in the aforesaid selected angular position.

---

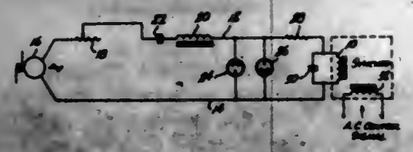
2,773,178
RADIO RECEIVING CIRCUIT FOR FREQUENCY MODULATION AND AMPLITUDE MODULATION BANDS
Henri Herman van Abbe and Abraham Geertrudus Wilhelmus Uitjens, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application September 10, 1952, Serial No. 308,871
Claims priority, application Netherlands September 17, 1951
1 Claim. (Cl. 250—20)



A radio receiving circuit for selectively receiving frequency modulated signals and amplitude modulated signals, comprising a first shielded combination tube having a triode section and a multi-grid section, a second shielded combination tube having a triode section and a multi-grid section, and switching means for selectively connecting said tubes in a first arrangement for receiving said frequency modulated signals and a second arrangement for receiving said amplitude modulated signals, said first arrangement comprising means for connecting the multi-grid section of said first tube as a high-frequency amplifier stage to amplify said frequency modulated signals, means for connecting the triode section of said second tube as a self-oscillating mixer stage coupled to receive the output signal of said amplifier stage, and means for connecting the multi-grid section of said second tube as an intermediate frequency amplifier stage coupled to receive the output signal of said mixer stage, said second arrangement comprising means for connecting the multi-grid section of said second tube as a mixer stage, means for feeding said amplitude modulated signals to the last-named mixer stage, and means for connecting the triode section of said first tube as a local oscillator coupled to said last-named mixer stage.

---

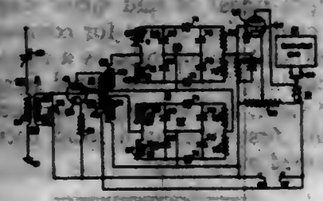
2,773,179
ELECTRONIC CIRCUITS FOR GENERATION OF OSCILLATION, FREQUENCY CONVERSION, AND OTHER FUNCTIONS
David M. Makow, Ottawa, Ontario, Canada
Application June 6, 1955, Serial No. 513,371
5 Claims. (Cl. 250—36)



1. An electrical circuit comprising three modulators a first, second and third modulator, each having two inputs and one output, the output of the first modulator being connected to one input of the second modulator and to one input of the third modulator, the output of the sec-

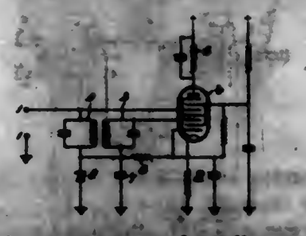
cuit modulator being connected to one input of the third modulator, the output of the third modulator being connected to one input of the first modulator and to the second input of the second modulator.

---



2,773,180
ALTERNATING VOLTAGE MODULATION SUPPRESSORS
Minoo Sabljan and John R. Ullenbruch, Seattle, Wash., assignors to Boeing Airplane Company, Seattle, Wash., a corporation of Delaware
Application November 10, 1952, Serial No. 319,688
13 Claims. (Cl. 250—27)

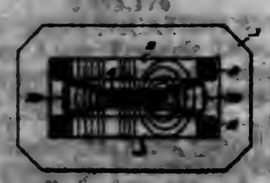
10. In combination, a source of substantially sinusoidal alternating voltage, load means, voltage stabilizer circuit means applying said source voltage to said load means including an element having inductance carrying current to said load means and having associated means forming a ferromagnetic flux path for said inductance element, said ferromagnetic flux path being materially saturated by flow of load current in said inductance element so as to peak the positive and negative half-cycles of alternating voltage applied by said circuit without materially changing the shape of the base portions of such voltage half-cycles, and voltage limiter means incorporated in said stabilizer circuit removing the positive and negative peaks from said peaked alternating voltage wave while leaving such base portions thereof substantially unaltered before application thereof to said load means.



---

2,773,181
FREQUENCY DISCRIMINATOR SYSTEM
John B. Siegel, Catonsville, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 25, 1951, Serial No. 253,867
8 Claims. (Cl. 250—27)

1. In a frequency selective receiver, the combination comprising a first discriminator unit comprising a pair of tuned circuits one of which is tuned to a mean frequency, the other being tuned to a frequency slightly below the mean frequency, a second discriminator unit comprising a pair of tuned circuits one of which is tuned to said mean frequency, the other being tuned to a frequency slightly above the mean frequency, means for applying an input signal to said discriminators, and means connected to add the outputs of said discriminators in a sense such as will produce a maximum output at said mean frequency.

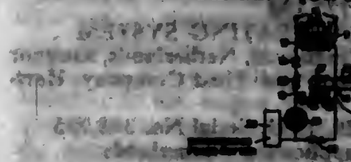


2,773,182
CIRCUIT-ARRANGEMENT FOR SILENT TUNING IN A FREQUENCY-MODULATION RECEIVER
Leendert Pattenmaker, Pieter Johannes Herbertus Janssen, and Hendrik Jacobus Otte, Hoeksewaard, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application June 20, 1952, Serial No. 295,692
Claims priority, application Germany July 19, 1951
3 Claims. (Cl. 250—37)

1. A circuit-arrangement for silent tuning in a frequency-modulation receiver comprising an electron discharge device having an anode, a cathode, and a plurality of control grids, and circuits therefor, a resistor disposed in the anode circuit, and means for applying frequency-modulated input oscillations to two of said control grids with a phase shift varying with the frequency-modulation to produce demodulated oscillations across said resistor, said applying means including means for producing grid-current rectification at both of said control grids, a single smoothing filter coupled to both of said control grids, means for producing a single control-grid bias voltage and means to apply said bias voltage to both of said control grids, said resistor having a value at which in the absence of the input oscillations said device operates on a portion of its anode current versus anode voltage curve having a steep slope and when the input oscillations have at least a predetermined magnitude the bias voltages vary automatically to operate said device on a portion of its anode current versus anode voltage characteristic curve having a gradual slope.

---

2,773,183
DEVICE FOR CONTROLLING THE FLOW OF ELECTRONS IN A BETATRON
Konrad Gund, Hans Berger, and Kurt von Sanden, Erlangen, Germany
Application October 28, 1950, Serial No. 192,732
Claims priority, application Germany October 31, 1949
5 Claims. (Cl. 250—27)



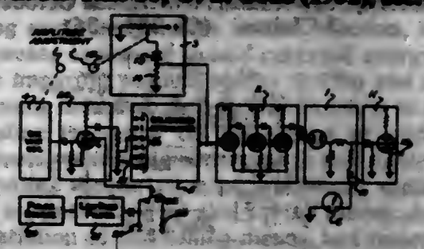
1. In a betatron having field poles and an exciter coil therefor which is excited in an alternating current circuit for producing respectively a magnetic guiding field and a magnetic accelerating field, said fields increasing in operation in accordance with the 1:2 condition, and having a vacuum vessel forming an accelerating chamber in which electrons are to be accelerated along a stabilized orbital path, said electrons being injected into said accelerating space from an electron source disposed outside of said stabilized orbital path; a device for disturbing said 1:2 condition to trap an increased number of electrons injected for acceleration so as to increase the yield of accelerated electrons, said device comprising an auxiliary coil completely surrounded circumferentially by said vessel, a capacitor, a thyratron, means for connecting said auxiliary coil and said capacitor and said thyratron in a resonance circuit, means controlled by said exciter circuit shortly after the instant of zero passage of the current therein and coincident with the instant of injection of electrons from said electron source for causing said thyratron to become momentarily conductive for the purpose of producing at said instant of electron injection in said auxiliary coil a current impulse which decays substantially sinusoidally, said impulse causing said disturbance of said 1:2 condition, the characteristics of said resonance circuit and the direction of current flow of said impulse through said auxiliary coil causing distribution of the injected electrons along a spiral path substantially throughout the entirety of said acceleration chamber to increase the density of injected and trapped electrons at the instant of injection thereof.

---

2,773,184
CONSTANT-CURRENT PULSE GENERATOR
Erich H. F. W. Rolf, Nuremberg, Germany, assignor to Siemens-Schuckertwerke Aktiengesellschaft, Berlin-Siemensstadt, Germany, a corporation of Germany
Application September 4, 1952, Serial No. 307,745
Claims priority, application Germany September 10, 1951
7 Claims. (Cl. 250—27)

1. A constant-current pulse generator, comprising a capacitor and a saturable reactor, said reactor comprising a saturable magnetic core with a load winding inductively coupled thereto, said load winding being connected in series with said capacitor, magnetizing means operatively associated with said core and maintaining a constant magnetomotive force acting thereon at least sufficient to saturate said core, cyclically operative charging means connected to said capacitor for charging said capacitor periodically to a predetermined potential, a load circuit, and circuit control means operating in synchronism with said cyclically operative means, said circuit control means being connected to said load winding and to said capacitor and periodically connecting the series combination of said load winding and said capacitor to said load circuit with said capacitor in a charged condition and disconnecting said series combination therefrom after discharge of said capacitor into said load circuit, the direction of current flow through said load winding during discharge of said capacitor having a polarity which magnetizes said core in opposition to said magnetizing means for desaturating said core during said discharge, whereby said load circuit receives successive pulses of substantially constant current delivered at a repetition rate determined by said cyclically operative means.

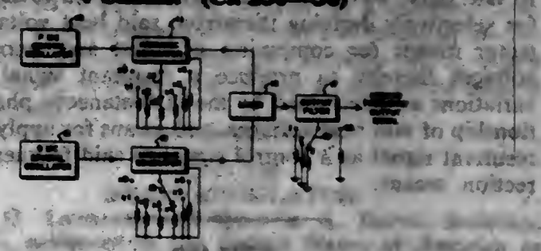
---



2,773,185
LOW FREQUENCY RANDOM-NOISE GENERATOR
Albert S. Fulton and Robert R. Bennett, Los Angeles, Calif., assignors, by mesne assignments, to Hughes Aircraft Company, a corporation of Delaware
Application January 5, 1952, Serial No. 265,176
6 Claims. (Cl. 250—36)

1. A very low frequency random noise generator for generating a selected narrow band of low frequencies including zero comprising: generating means for generating electrical random noise over a selected frequency spectrum extending well up in the audio region; a tunable bandpass filter having a passband of approximately twice the width of said selected narrow band of low frequencies centered about a selected relatively high audio frequency in said frequency spectrum, said filter being electrically connected to said generator means; a square wave generator for generating a square wave signal having a frequency equal to said selected relatively high audio frequency; and a balanced ring demodulator electrically coupled to said bandpass filter and to said square wave generator, said demodulator heterodyning said selected high audio band of frequencies with said square wave signal thereby producing said low frequency random noise over said narrow band of frequencies including zero.

---



2,773,186
SIGNAL-TO-NOISE GENERATORS
Joseph E. Herrmann, Jr., Indianapolis, Ind.
Application January 28, 1955, Serial No. 484,888
11 Claims. (Cl. 250—36)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A signal-to-noise ratio measuring system comprising a noise generator, an amplifier with bandpass characteristic, and a linear detector coupled in cascade, the output of the noise generator being adjustable to produce a current through the detector at a midpoint on the linear portion of the voltage-current characteristic of the detector; a high frequency generator, a gate tube with a control grid and an auxiliary grid, and a calibrated adjustable attenuator coupled in cascade and to the input to said amplifier; and means coupled to the auxiliary grid to selectively open and close the gate tube, with further means to selectively open the gate tube for long periods of time or for repetitive microsecond periods of time.

---

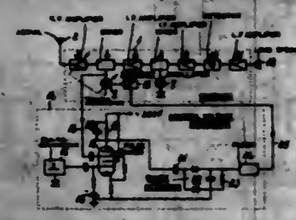
2,773,187
CRYSTAL OSCILLATOR CIRCUITS OR THE LIKE
Norman J. Regnier, San Leandro, Calif., assignor to Hoffman Electronics Corporation, a corporation of California
Application February 1, 1954, Serial No. 407,413
4 Claims. (Cl. 250—36)

1. A selectable frequency signal generator for generating a plurality of signal frequencies having a uniform frequency spacing including, in combination, a first crystal-controlled oscillator, means responsive to the output signal from said first oscillator for selectively multiplying the frequency of said signal by one of a plurality of low multiplication factors, a second crystal-controlled oscillator having a frequency of 1 megacycle removed from the frequency of said first crystal-controlled oscillator, means responsive to the output signal from said second oscillator for selectively multiplying the fre-

quency of such signal by one of a plurality of low multiplication factors, intermodulation means responsive to the output signals from both frequency multiplying means for intermodulating such signals, filter means responsive to the output signal from said intermodulation means to pass selectively signals at the desired frequency, and said oscillator frequencies ($x$ and $y$) and said multiplication factor ranges ($a$ and $b$) of each of said frequency multiplying means satisfying the following equations:

$$\pm a(x)+b(y)=z$$
$$x-y=1 \text{ (mc. where } x \text{ and } y \text{ are in mc.)}$$

where $z$ is a desired frequency.



---

2,773,188

## AUTOMATIC FREQUENCY CONTROL

Edward Herman Hamerschlag, Hilversum, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application September 25, 1952, Serial No. 311,421
Claims priority, application Netherlands October 17, 1951
3 Claims. (Cl. 250—36)

1. A circuit arrangement comprising oscillator means for producing a first wave at a first given frequency value, frequency correction means coupled to said oscillator means, a source of pulse wave having a given pulse recurrence frequency value and having harmonic components at frequency values less than and greater than the said first given frequency value, means coupled to said oscillator means and said pulse source for producing a first beat voltage having a frequency equal to the difference between the frequencies of said first wave and a first of said harmonic components having a frequency less than said first given frequency value and for producing a second beat voltage having a frequency equal to the difference between the frequencies of said first wave and a second of said harmonic components having a frequency greater than said first given frequency value, said first and second harmonic components having frequency values at which said beat voltages have substantially equal frequency values, said beat voltage producing means comprising a mixing stage selectively conductive in response to said pulse wave and filter means coupled to said stage for selectively deriving therefrom said beat voltages, detector means for combining said first and second beat voltages thereby to produce a resultant signal having variations as determined by the instantaneous phase relationship of said beat voltages, and means for applying said resultant signal as a control signal to said frequency correction means.

---

2,773,189

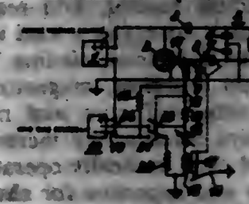
## CIRCUIT-ARRANGEMENT FOR SYNCHRONIZING AN OSCILLATOR TO A PILOT WAVE

Peter Johannes Hubertus Janssen, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application October 28, 1952, Serial No. 317,309
Claims priority, application Netherlands November 6, 1951
5 Claims. (Cl. 250—36)

1. Apparatus for synchronizing an oscillator in accordance with a pilot wave comprising a phase-comparison stage, means to apply a first wave derived from said pilot wave as an input to said stage, means including a phase-shifting network to apply a second wave derived from said oscillator as an input to said stage to compare in phase with said first wave whereby said stage develops a control voltage depending on the phase difference therebetween, said network comprising a resonant circuit

tuned to the nominal fundamental frequency of said second wave for imparting a phase-shift to said second wave in a direction counteracting the phase displaced between said first and second waves, and means to apply said control voltage produced by said stage to said oscillator to effect said synchronism.



---

2,773,190

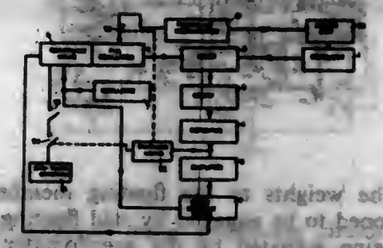
## HIGH-FREQUENCY HEATING SYSTEM

Jacob Willem de Ruiter, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application October 29, 1953, Serial No. 388,995
Claims priority, application Netherlands November 29, 1952
2 Claims. (Cl. 250—36)

1. A high-frequency heating system comprising an oscillator, said oscillator comprising an electron discharge tube having a control grid and a feedback circuit coupled to said control grid, said feedback circuit comprising a variable impedance coupled to said control grid, a direct current circuit coupled to said control grid, a control member coupled to said variable impedance whereby variation in position of said control member produces variation in the impedance value of said variable impedance thereby varying the excitation of said control grid, a spring disposed to exert a force in a given direction on said control member, said direct current circuit including a coil disposed to exert a force on said control member in a direction opposite to said given direction, said last-mentioned force having a magnitude as determined by the magnitude of the current in said direct current circuit, a grid bias source, means for selectively applying a negative grid bias from said source to said tube to cut off said tube, and means operative substantially simultaneously with said last-mentioned means for applying a current from said source through said coil thereby exerting a force on said control member in a direction opposite to said given direction whereby minimum excitation of said control grid is produced when said negative grid bias cuts off said tube.

---



2,773,191

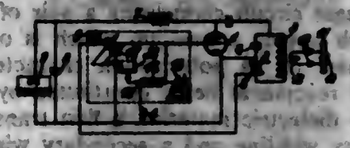
## AUTOMATIC FREQUENCY CONTROL

Thomas Brown Watkins, London, England, assignor to The General Electric Company Limited, London, England

Application October 25, 1950, Serial No. 191,961
Claims priority, application Great Britain November 2, 1949
9 Claims. (Cl. 250—36)

1. An oscillation generator for generating electrical oscillations of very high frequency comprising a first electrical means to generate first electrical oscillations of very high frequency, a second electrical means to generate second electrical oscillations of substantially lower frequency which oscillations are frequency modulated at still lower frequency, a mixer, circuit means connecting said first and second electrical means to said mixer, detector means, band-pass filter means having a relatively narrow band width through which output oscillations from said mixer are fed to the detector means, frequency dis-

criminating means supplied from the said second electrical means, means responsive to the output signal from said detector means to control the mean operating frequency of the second electrical means, and means responsive to the output signal from said frequency discriminator means to control the operating frequency of the first electrical means so that the frequency of the first electrical oscillations is determined essentially by the mid-band frequency of said band-pass filter.



---

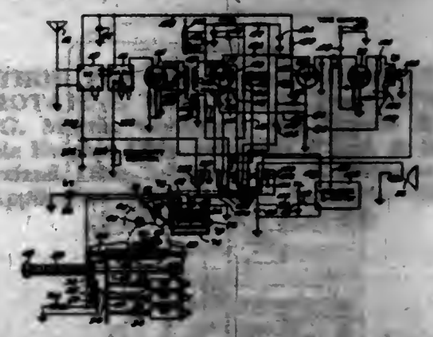
2,773,192

## STABILIZED OSCILLATOR

Lourens Blok, Gerrit Stavre, Gosliwa Zwanenburg, and Jacob Willem de Ruiter, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application April 10, 1952, Serial No. 281,642
Claims priority, application Netherlands April 18, 1951
8 Claims. (Cl. 250—36)

1. A high frequency wave generator for a furnace comprising an oscillator provided with an electron discharge tube having a control grid and an anode and circuits therefor, an output circuit coupled to said anode and a feedback circuit coupling said output circuit to the grid circuit of said tube to sustain oscillations, and a stabilizing device for said oscillator including an electromagnet having a coil interposed in said grid circuit and a control member positioned for deflection by said coil in accordance with direct current flow in said grid circuit, said control member being coupled to said feedback circuit to vary the extent of said feedback as a function of grid current flow, and a spring element loading said control member, said electromagnet having a predetermined characteristic curve representing the attractive force exerted magnetically on said control member by the direct current flow in said grid circuit in the condition of approximately maximum permissible oscillator excitation in accordance with deflection of said control member, said spring element having a given curve representing the spring force acting on said control member in accordance with deflection thereof which is a mirror image of said predetermined curve with respect to the axis on which said deflection is plotted, whereby said control member occupies a position of equilibrium independently of its deflection.



2,773,193

## SIGNAL TUNED RADIO APPARATUS

Edward F. Andrews, Chicago, Ill., assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application November 13, 1950, Serial No. 195,161
11 Claims. (Cl. 250—40)

1. In signal tuned radio apparatus, variable tuning means, potential energy storage means connected thereto for varying said tuning means in one direction, manually movable means connected to said potential energy storage means for imparting manual energy thereto and for moving said tuning means in the opposite direction to positions corresponding to partial or full charge of said storage means, means operatively connected to said tuning means for terminating the variation of said tuning means in response to a signal tuned by said tuning means, means for starting variation of said tuning means, and remote means unidirectionally connected to said manual means whereby said manual means may be operated independently of said remote means while appropriate operation of said remote means effects partial or full charge of said storage means and corresponding positioning of said tuning means.

---

2,773,194

## EXTENDED-RANGE HIGH-FREQUENCY TUNING DEVICE AND CIRCUIT

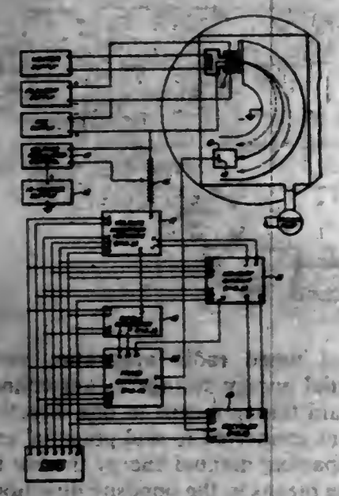
William F. Sands, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application January 16, 1952, Serial No. 266,678
The terminal 15 years of the term of the patent to be granted has been disclaimed
6 Claims. (Cl. 250—40)

1. A high frequency tuning inductor of the variable permeability type comprising a pair of helical windings, in substantially end-to-end relation on a common axis, capacitor means interposed between and coupling the adjacent ends of said windings, and variable tuning means longitudinally movable with respect to and in the field of said windings.

---

2,773,195



## BEAM REGULATOR

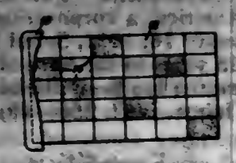
Ernest O. Lawrence and Quentin A. Kerns, Berkeley, Calif., assignors to the United States of America as represented by the United States Atomic Energy Commission

Application March 25, 1948, Serial No. 16,928
8 Claims. (Cl. 250—41.9)

1. In a calutron including an ion source and an ion accelerating voltage for forming an accurate beam of polyisotopic ions and a collecting element disposed in said beam for collecting and discharging a selected portion of the ions therein, a beam regulator comprising in combination voltage altering means for adjusting said ion accelerating voltage whereby the maximum current portion of said beam of ions is temporarily directed toward said collecting

element for a relatively short time-interval sufficient to orient the selected portion of the beam in a desired position with respect to said collector, timing means for periodically altering said ion accelerating voltage a predetermined fraction thereof, whereby the maximum current portion of said beam of ions is deflected a precise

distance with respect to said collecting element, and voltage regulating means for maintaining the position of said deflected beam constant for a relatively long time-interval as compared with the interval during which the maximum current portion of said beam is temporarily directed toward said collecting element until said timing means effects a subsequent alteration of said accelerating voltage.



---

2,773,196

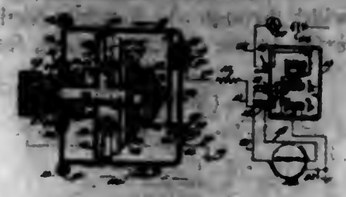
## IDENTIFICATION CARD

Leonard I. Hall, Rochester, N. Y.

Application February 18, 1953, Serial No. 337,670
1 Claim. (Cl. 250—106)

An identification card comprising a central layer and two outside layers, said central layer being disposed between the two outside layers and being ruled off in a plurality of columns of squares, certain of said squares being impregnated with radio-active material, that is invisible to the naked human eye, the location of an impregnated square in a column designating a specific number, and the number of the card being determined by the location of all the impregnated squares, and the two outside layers being made of material opaque to visible light, one of said outside layers bearing a number visible to the naked human eye.

---



2,773,197

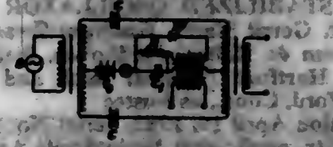
## AUXILIARY GENERATOR CHARGING RATE CONTROL

Bryant Y. Gray, Houston, Tex.

Application October 25, 1954, Serial No. 464,486
4 Claims. (Cl. 290—30)

1. A charging rate control comprising a generator having a field winding, a generator regulator including a conventional resistance, a speedometer cable, an auxiliary resistor connected in parallel with said conventional resistance whereby the amount of current in the field winding of the generator is increased with the vehicle traveling at low speed, and a governor including a housing, a shaft rotatably mounted in the housing, a floating member slidably mounted on the shaft, spaced plates with slots therein carried by the shaft, weights positioned to travel in the slots of the plates, means operatively

connecting the weights to the floating member, and a switch positioned to be engaged by said floating member, said shaft being actuated by the speedometer cable of the vehicle and said switch cutting out the auxiliary resistor as the speed of the vehicle reaches a predetermined amount.



---

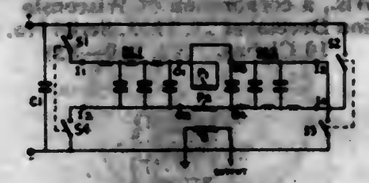
2,773,198

## TRIGGER CIRCUIT OF THE MAGNETIC OR DIELECTRIC TYPE

Simon Duinker, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application July 23, 1953, Serial No. 369,793
Claims priority, application Netherlands August 7, 1952
17 Claims. (Cl. 307—88)

17. A trigger circuit comprising a pair of variable reactances each having a medium which is operable in a non-linear part of its polarization characteristic curve, each of said reactances being constituted by a capacitor containing a dielectric material, a first transformer having a primary winding and a secondary winding having a tap thereon, a second transformer having a primary winding having a tap thereon and a secondary winding, one end of the secondary winding of said first transformer being connected to one end of the primary winding of said second transformer through one of said reactances, the other end of the secondary winding of said first transformer being connected to the other end of the primary winding of said second transformer through the other of said pair of reactances, a direct current source, a pulsatory oscillation source, a coupling capacitor, a third transformer having a first winding, a second winding and a third winding, said sources, said coupling capacitor and said first winding being serially connected between said taps, a source of local oscillation connected across the primary winding of said first transformer, said local oscillation having a frequency which is high as compared with the frequency of said pulsatory oscillations, a resistor connected across said coupling capacitor, and a rectifier connected serially with the second winding of said third transformer across said resistor, whereby the secondary winding of said second transformer has an output voltage comprising only components the frequencies of which are odd multiples of the frequency of the local oscillation and the third winding of said third transformer has an output voltage comprising only components the frequencies of which are even multiples of the frequency of the local oscillation.



2,773,199

## ELECTRICAL PULSE GENERATING CIRCUIT ARRANGEMENTS

Graham John Sealey, East Sheen, London, England, assignor to Metropolitan-Vickers Electrical Company Limited, London, England, a British company

Application August 15, 1952, Serial No. 304,507
Claims priority, application Great Britain August 28, 1954
4 Claims. (Cl. 307—106)

4. An electrical pulse generating circuit arrangement comprising a pair of substantially similar pulses forming networks, each of said networks comprising a chain of sections of series inductance and shunt capacitance, input and output ends to each of said networks, a pair of terminals to each of said network ends, a load transformer, a pair of primary windings to said load transformer said windings cross connecting corresponding output terminals of the two networks, a secondary winding to said load transformer, a source of direct voltage and switching means for connecting said direct voltage source to the input ends of said two networks alternately whilst maintaining the input end of the other network open circuited, the connections being such that recurrent unidirectional pulses are generated in the load transformer secondary winding.

## DIRECT CURRENT TRANSFORMATION DEVICE

Walter B. Gregg, Snyder, N. Y., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application October 22, 1954, Serial No. 463,936
5 Claims. (Cl. 307—110)

5. Apparatus for transforming the output of a direct voltage source having a given terminal voltage to a second voltage across a load comprising: first and second sets of capacitor means; first half-wave rectifier means serially connecting the capacitors in each set of capacitor means; a plurality of first transistor switch means each having emitter, base and collector electrodes adapted to connect said first set of capacitor means in said set of capacitors in parallel through the emitter-to-collector current conduction path thereof; a plurality of second transistor switch means each having emitter, base and collector electrodes adapted to connect said second set of capacitor means in parallel through the emitter-to-collector current conduction path thereof; means connecting said first and second sets of capacitor means to said load and said source including third and fourth transistor switch means each having emitter, base and collector electrodes and respectively associated with said first and second sets of transistor and second half-wave rectifier means, the coupling action of said third and fourth transistor means being through the emitter-to-collector current conduction path thereof; means coupled to each of said base electrodes and an electrode adjoining thereto adapted to actuate said first and second transistor switch means in 180° relationship, and said third and fourth transistor means in 180° relationship.

---

## METHOD FOR EVAPORATIVE COOLING OF ROTATING ELECTRICAL MACHINERY

Cecil G. Martin, Cleveland, and Harold H. Hempel, Maple Heights, Ohio, assignors to Jack & Heintz, Inc., Cleveland, Ohio, a corporation of Delaware

Application April 16, 1954, Serial No. 423,636
3 Claims. (Cl. 310—54)

1. In a rotating electrical machine including a housing and a stationary mounting frame therein, a stator and a hollow rotor mounted inside of said stator with an air gap therebetween, a rotatably driven shaft rigid with said rotor and supported by said frame, a supply line for supplying coolant liquid under pressure from an external source to the internal annular surface of said hollow rotor to be vaporized in said machine into an evaporant, a hollow tube extending radially inwardly from said air gap to a point radially inwardly disposed with respect to the internal surface of said rotor to maintain a reservoir of a predetermined column of liquid coolant, through the centrifugal force of the rotation of said rotor, before being conveyed through said tube to said air gap upon the occurrence of coolant liquid in excess of said predetermined column, a thermally responsive element carried by said stator, valve means for controlling the supply of coolant liquid to said rotor, electrically actuated means for normally maintaining said valve means closed, an external electric power source and a normally open switch means in circuit with said electrically actuated means and electric power source, said thermally responsive element, upon exposure to the existence of a predetermined degree of heat, being adapted to close said switch means and actuate said electrically actuated means to open said valve means to supply additional coolant liquid to said rotor and convey evaporant therefrom through said tube to said air gap to cool said stator.

## INDUCED CURRENT TORQUE TRANSMITTER

Henry S. Jacobs, Shorewood, and Jeremiah M. Curtis, Milwaukee, Wis., assignors to Heinicke Instrument Corporation, Milwaukee, Wis., a corporation of Wisconsin

Application February 11, 1952, Serial No. 271,822
10 Claims. (Cl. 310—64)

1. In an electro-magnetic torque transmitting apparatus of the induced current type, the combination comprising a field member adapted to be electrically excited to produce a magnetic flux, an induced current member relatively rotatable with respect to said field member including a hollow circular drum of magnetic material, said circular drum having a plurality of circumferentially spaced axially extending openings open at both ends to permit passage of air therethrough, a lining for each of said axially extending openings extending substantially

throughout the same and composed of material having a greater heat conductivity and electrical conductivity than the magnetic material of said drum, and said drum having a plurality of spaced slots extending axially across the outer surface of said drum, said slots being spaced between said axially extending openings to reduced thermally induced stresses in the surface of said drum.

7. In an electro-magnetic torque transmitting apparatus of the induced current type, the combination comprising a circular field member having an even number of radially elongated slots therein dividing the same into an even number of pole pieces, a pair of windings having radially offset winding sides in each of said slots, one of said windings comprising a coil with multiple turns encircling the pole on one side of said slot and the other of said windings comprising a coil with multiple turns encircling the pole on the opposite side of said slot, said windings being connected to magnetize said poles with opposite polarity in sequence around the circumference of said field member when said windings are excited, and a hollow circular drum of magnetic material mounted within and in relatively rotatable relation with said circular field member, said drum having a plurality of spaced slots extending axially across the outer surface thereof.

## DYNAMOELECTRIC MACHINE

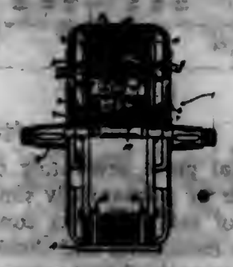
Lawrence G. Opel, Tonawanda, and Albert W. Kimball, Sr., Buffalo, N. Y., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application August 28, 1953, Serial No. 377,062

1 Claim. (Cl. 310—65)

A dynamoelectric machine having a stator member and a rotor member, said rotor member including a laminated rotor core comprising a plurality of thin laminations disposed in contact with each other in a stack, said core having peripheral slots and a winding in said slots, the rotor core having a plurality of axial ventilating passages extending therethrough, and a plurality of vent laminations disposed between certain of the laminations of the core and spacing the core laminations apart to form a radial duct, said vent laminations being coaxial with the core laminations and having generally radial arms, the diameter of the vent laminations at the ends of the arms being less than the diameter at the bottom of said slots of the core laminations to provide circumferential cooling passages at the bottom of said winding, and the radial arms forming slots between them communicating with said axial ventilating passages and extending to the periphery of the vent laminations.

---



2,773,284

## ELECTRO-MAGNETIC APPARATUS FOR TORQUE TRANSMISSION

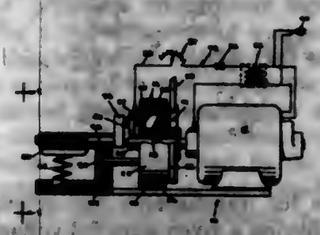
Henry S. Jacobs, Shorewood, and Theodore M. Fast, West Allis, Wis., assignors to Harnischfeger Corporation, Milwaukee, Wis., a corporation of Wisconsin

Application December 29, 1953, Serial No. 400,941

10 Claims. (Cl. 310—93)

1. In an induced current torque transmitting apparatus the combination of a field member having circumferentially spaced magnetic poles, an induced current member relatively rotatable with respect to said field member having a rim of magnetic material with an air gap surface closely spaced from said poles and a back face oppositely disposed with respect to the air gap surface, a plurality of rotor bars of relatively low electrical resistance supported by said induced current member to traverse flux extending from said magnetic poles through said rim upon relative rotation of said field and induced current members to induce currents therein, and a plurality of conducting fins each of relatively high electrical resistance with respect to that of a rotor bar that are connected between the ends of the rotor bars and extending along the back face of said rim.

---



2,773,285

## POWER TRANSMITTING APPARATUS

Howard J. Findley, Cleveland, Ohio, assignor to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio

Application June 3, 1952, Serial No. 291,460

5 Claims. (Cl. 310—96)

1. A power transmitting apparatus comprising a standard, an electromagnetic clutch supported for rotation on the standard, including cooperative concentrically disposed driving and driven members, power means connected to the driving member of the clutch, a brake band engageable with the driven member of the clutch radially outwardly of the driving and driven members of the clutch, having one end anchored on the standard and its other end resiliently urged in a direction to impose a braking load on the driven member, means supported on the standard, engageable with the resiliently urged end of the brake band for actuating the brake band in opposition to the resilient load of the band and said brake band being selectively engageable and disengageable while said electromagnetic clutch is energized whereby said clutch slips when said brake is engaged.

2,773,286

## MAGNETIC POSITIVE DRIVE COUPLINGS

Igor V. Zozulin, George J. Okulitch, George M. Volkoff, Vladimir J. Okulitch, and Alec S. J. Elliott, Vancouver, British Columbia, Canada, assignors, by mesne assignments, to Torque Transmissions Limited, Vancouver, British Columbia, Canada

Application May 18, 1954, Serial No. 430,963

3 Claims. (Cl. 310—100)

1. A magnetic positive drive coupling comprising a hub sleeve having an outer end portion adapted for connection to a drive shaft and an outer sleeve concentric therewith having one end forming a power take off, said outer sleeve supporting at its outer end a housing, said housing having an outer rim forming a bimetallic rotor and a clutch drum, said outer sleeve having an annular row of magnets mounted in driving opposition to the bimetallic rotor, a plurality of clutch shoes movable to engage the inner periphery of the clutch drum and other magnets adapted to hold the clutch shoes retracted from engagement with the clutch drum until the slip between the bimetallic rotor and its magnets is reduced to a predetermined magnitude, said last named magnets being carried by the outer sleeve to rotate in unison with the annular row of magnets.

---

2,773,287

## FLYWHEEL MAGNETO

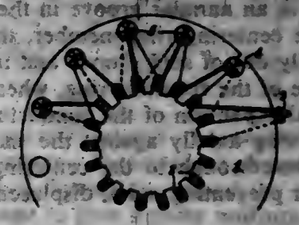
Hugo F. Rudaisa, Beloit, Wis., assignor to Fairbanks, Morse & Co., Chicago, Ill., a corporation of Illinois

Application November 12, 1953, Serial No. 391,642

2 Claims. (Cl. 310—153)

1. In a flywheel assembly for a flywheel magneto, a unitary cast flywheel member formed of non-magnetic material and providing an annular rim, a permanent bar magnet of predetermined relatively short length, a pair of pole shoes each being a pre-formed unitary element of compressed sintered magnetic material, each pole shoe being formed to provide a pole portion presenting an arcuate pole face of a length less than the length of said bar magnet and a portion projecting laterally from the back side of the pole portion and terminating in a flange, said projecting portion and flange cooperating with the part of the pole portion adjacent said projecting portion and underlying said flange, to form a recessed seat for embracing an end of the bar magnet, and said bar magnet and pole shoes having the bar magnet ends in magnetic engagement in the recessed seats of the pole shoes, being cast in situ in said annular rim of the cast flywheel member in a position therein such that only the arcuate pole faces of the pole shoes are exposed at the inner periphery of said annular rim.

2,773,288



## RING WINDING FOR ELECTRICAL MACHINES

Philip Richardson, Newcastle-upon-Tyne, England, assignor to C. A. Parsons & Company Limited, Newcastle-upon-Tyne, England

Application January 6, 1954, Serial No. 402,444

Claims priority, application Great Britain January 13, 1953

2 Claims. (Cl. 310—202)

1. A ring winding for a polyphase electrical machine containing 3 phases wherein the conductors around the periphery remote from the air gap are arranged in groups containing an equal number of ampere conductors from each phase.

---

2,773,209

## CARBON BRUSH HOLDER

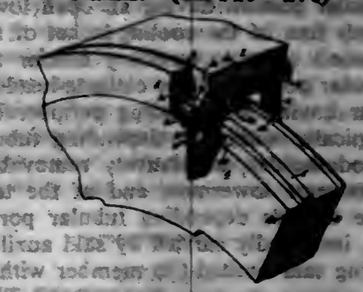
William P. Kirkwood, North Royalton, Ohio

Application April 14, 1955, Serial No. 501,342

9 Claims. (Cl. 310—247)

1. A carbon brush holder comprising an insulating body having a bore for receiving a carbon brush therein, a removable end cap on said insulating body, and a metal electrical conductor in said insulating body and extending from end to end thereof, said conductor protruding from the end of said insulating body remote from said cap, said conductor having a plurality of convolutions formed therein some of which are exposed by said bore to reinforce a section thereof but with other convolutions being completely embedded in said insulation body for reenforcing it.

---



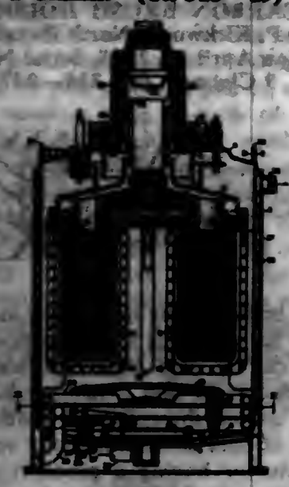
2,773,210

## RETAINING RING STRUCTURE FOR END WINDINGS OF DYNAMOELECTRIC MACHINE

George H. Vogt, Wakefield, Mass., assignor to General Electric Company, a corporation of New York

Application August 29, 1955, Serial No. 531,210

3 Claims. (Cl. 310—270)

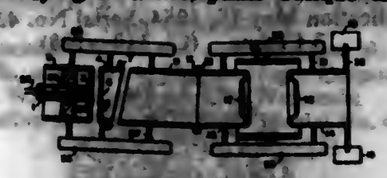


1. In retaining ring structure for a dynamoelectric machine rotor having conductors disposed in axial slots in the rotor body with a plurality of conductor end portions extending circumfereatially through an arc around a reduced diameter end portion of the rotor, the combination of a first centering ring member on the reduced diameter end portion of the rotor and spaced axially from the rotor body, a retaining ring member surrounding the conductor end portions and having a first inwardly projecting

flange portion contacting the circumferential surface of said first ring member, an outwardly extending flange defined by said centering ring member disposed adjacent said first flange whereby the retaining ring is prevented from moving axially in one direction relative to the centering ring, means for preventing the retaining ring from moving axially in the other direction comprising a snap ring disposed in an annular groove in the circumferential surface of the centering ring member, the snap ring extending radially out of said groove and into contact with an end surface of the retaining ring, whereby axial forces due to thermal expansion of the conductors tend to move the retaining ring axially against the snap ring and are transmitted therethrough to the centering ring, and second means for preventing radial displacement of the snap ring.

---

2,773,211
LARGE SEALED IGNITRON-TUBE
August P. Colaluca, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 14, 1955, Serial No. 481,787
2 Claims. (Cl. 313—19)



1. A vapor-arc tube having an evacuated metal container comprising an upright cylindrical side-wall having a cooling-jacket, a cathode-header having a cooling-jacket, and an anode-header; said tube also having an anode-structure which is insulatedly carried by the anode-header, a cathode-pool in a central portion of the cathode-header, and a limited-life member which is supported within the tube from the cathode-header; said cathode-header being relatively permanently joined to the side-wall; said cathode-header having a smaller depending tubular portion having an open lowermost end which extends free of the cooling-jacket of the cathode-header, a small separate auxiliary header for said depending tubular portion of the cathode-header, said auxiliary header having a depending peripheral flange, fitting telescopically within its depending tubular portion of the cathode-header, a relatively removable joint between the extreme lowermost end of the telescopically fitting flange and its depending tubular portion, and a support-rod, insulatedly carried by said auxiliary header, for supporting said limited-life member within the tube.

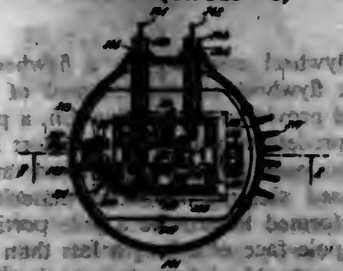
---

2,773,212
ELECTRON GUN
James A. Hall, Elmira, N. Y., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application August 14, 1953, Serial No. 374,249
5 Claims. (Cl. 313—82)

1. An electron gun comprising a control electrode and a screen-grid electrode, said electrodes comprising coaxial cylinders of inside diameter D having diaphragms normal to their common axis and with apertures lying on said axis, an electron source on said axis on the side of said control electrode aperture remote from said screen-grid electrode, a rim of said screen-grid remote from said control grid lying in a first plane oblique to said axis,

the major length of said screen-grid being not over .55 D, a first anode cylinder of diameter D and having a rim adjacent to said screen-grid lying in a second plane parallel to said first plane and separated therefrom by a gap substantially 0.20 D wide, and an electron lens at the other end of said first anode cylinder such that substantially all focussing effect occurs in it.

---

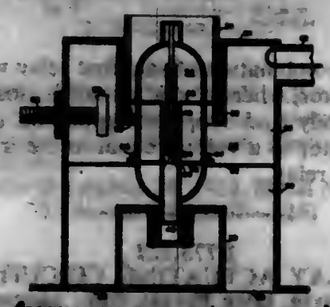


2,773,213
ELECTRON BEAM TUBES
Wellesley J. Dodds, Allentown, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application March 13, 1951, Serial No. 215,236
17 Claims. (Cl. 315—3.6)

1. An electron tube of the traveling wave type comprising an elongated conductive helix, means for projecting a beam of electrons through and in energy-coupling relation with the entire length of said helix, and means for limiting the amplifying bandwidth of said helix comprising at least one elongated transmission line inductively coupled to said helix at least at equally-spaced points distributed along substantially the entire length of said helix, and means causing the combination of said helix and said coupled transmission line to be dispersive along substantially the entire length thereof.

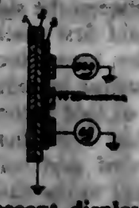
---

2,773,214
VELOCITY MODULATION TUBES
Jean P. Vega, Paris, France
Application February 17, 1951, Serial No. 211,506
9 Claims. (Cl. 315—6)



4. A velocity modulation electron discharge device comprising in combination narrow rectangular cathode and collector electrodes, buncher and catcher re-entrant prismatic cavity resonators of different cross sections but of substantially the same height with each other and with said cathode and collector electrodes, and adapted to have a ribbon-shaped electron stream emitted by said cathode pass through narrow electron permeable sections extending over the total height thereof, the buncher resonator being short-circuited at both ends and the catcher resonator being short-circuited at one end only, a supplementary cavity resonator coupled to the other end of said catcher resonator, the buncher resonator being adapted to oscillate in a system of standing waves having a half-phase-wavelength equal to its height and the catcher resonator being adapted to oscillate in a system of standing waves having a quarter-phase-wavelength equal to its height, means for applying input energy to said buncher resonator located near one end thereof, and means for extracting output amplified energy from the catcher resonator located near the junction of the catcher and supplementary resonators.

---



2,773,215
HIGH-FREQUENCY APPARATUS
Coleman J. Miller, Catonsville, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 22, 1952, Serial No. 267,671
10 Claims. (Cl. 315—41)

1. A high frequency apparatus comprising a cavity resonator, a wall of conducting material extending across said cavity resonator dividing said cavity resonator into a first part and a second part, said wall having a hole therethrough, a rod of conducting material extending through said hole, said rod having cross-sectional dimensions at the point where it passes through said hole which are substantially less than the dimensions of said hole, said rod being electrically separated from said wall, means connected to said first part for supplying high-frequency oscillations to said first part and means connected to said second part for deriving high-frequency oscillations from said second part.

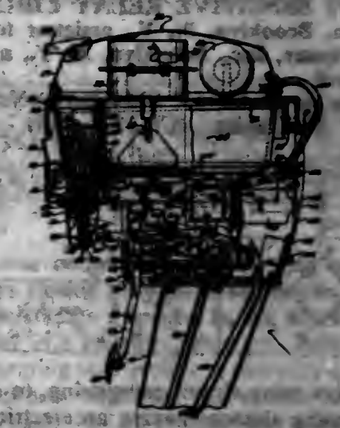
---

2,773,216
ANIMATED DISPLAY DEVICE
Theodore Edmonds, Danvers, Mass., assignor to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts
Application January 9, 1953, Serial No. 330,513
11 Claims. (Cl. 315—169)

1. An electroluminescent display device comprising a layer of electroluminescent material whose emission color varies with the frequency of the field applied thereto, at least one electrode on one side of said layer, and at least two electrodes on the other side of said layer and electrically insulated from each other.

---

2,773,217
FLUORESCENT LAMP SYSTEM
Robert J. Cassidy, Mansfield, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application January 29, 1952, Serial No. 268,841
5 Claims. (Cl. 315—198)

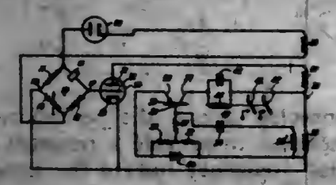


1. In a control circuit for gas-filled lighting tubes, a source of variable frequency A. C. power whose higher frequencies are several times the lower ones and which varies over the range during normal operation, a transformer having a primary and a secondary winding, said primary winding being connected to the source of power and the secondary winding connected to the tubes, and

a condenser connected across the secondary winding whose value is selected to provide a resonant condition at a predetermined frequency toward the upper end of the frequency range to give a more uniform output from the source and to increase the output to the tubes at the higher frequencies.

---

2,773,218
LIQUID DISPENSING MECHANISMS
Frederick H. Newman, Jr., Port Washington, Wis., assignor to Superdisplay Incorporated, Milwaukee, Wis., a corporation of Wisconsin
Application September 29, 1952, Serial No. 312,095
7 Claims. (Cl. 317—123)

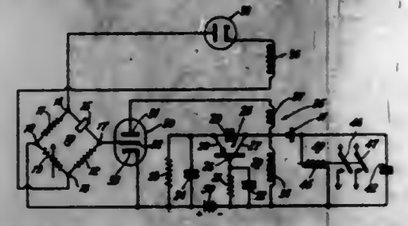


1. In combination a solenoid having a normally retracted plunger movable to a projected position; a power circuit for said solenoid; a pivotally mounted motion transmitting lever connected to said solenoid plunger; a switch connected in the power circuit to said solenoid to control the same and having a button movable on an axis normal to the axis of said plunger; and a trigger blade mounted for axial movement parallel with the axial movement of said switch button, said blade having a portion positioned to engage the end of said button whereby switch-button-depressing axial movement of said trigger blade causes projecting movement of said plunger, the mounting of said blade also permitting movement in a transverse plane parallel to the axis of said solenoid plunger, said blade being positioned in the path of movement of said solenoid plunger to be moved transversely by said plunger out of engagement with the end of said switch button when said plunger moves to projected position.

---

2,773,219
LIGHT SENSITIVE RELAY CIRCUIT
Mitchell Aron, Brooklyn, N. Y., assignor to Radio Receptor Company, Inc., Brooklyn, N. Y., a corporation of New York
Application November 10, 1954, Serial No. 467,972
13 Claims. (Cl. 317—124)

1. A sensitive relay circuit comprising, in combination, a light energy sensing element having an electrical resistance variable as a function of the light energy received thereby; a transistor oscillator having an output circuit; a relay having an operating coil in series with the collector

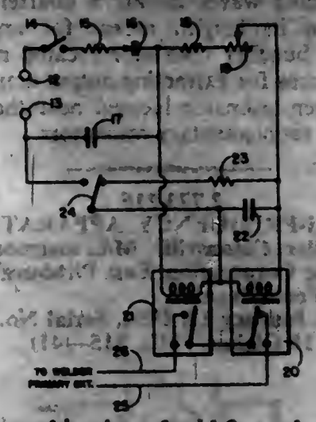


electrode of said transistor oscillator; a low voltage source of D. C. potential connected to supply operating potential to said oscillator; an amplifier having an input circuit including said element connected in series with the amplifier control component, and an output circuit coupled in series with said oscillator output circuit; means, including circuit connections for applying across said amplifier in-

put circuit a rectified operating potential derived from said oscillator output circuit; and sensitivity adjustment means in series with said element in said input circuit to adjust the bias of said input circuit to a value such that said amplifier is conductive when no light is incident on said element; whereby, when no light is incident on said element, said amplifier will damp the oscillator output to a value insufficient to energize said coil.

---

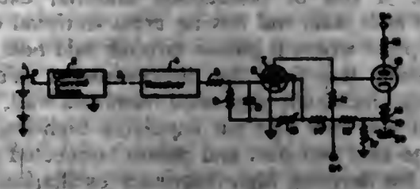
2,773,220
LIGHT SENSITIVE RELAY CIRCUIT
Mitchell Aron, Brooklyn, N. Y., assignor to Radio Receptor Company, Inc., Brooklyn, N. Y., a corporation of New York
Application November 10, 1954, Serial No. 467,909
10 Claims. (Cl. 317—130)



1. A sensitive relay circuit comprising, in combination, an energy sensing element having an electrical resistance variable as a function of the energy received thereby; a transistor oscillator having an output circuit; a relay having an operating coil connected in said output circuit for energization thereby; a low voltage source of D. C. potential connected to supply operating potential to said oscillator and in circuit connection with said relay operating coil; an amplifier having an input circuit including said element connected in series with the amplifier control element, and an output circuit coupled in series with said oscillator output circuit; means, including circuit connections, for applying across said amplifier input circuit a rectified operating potential derived from said oscillator output circuit; and sensitivity adjustment means in series with said element and said input circuit to adjust the bias of said input circuit to a value such that said amplifier is conductive when no light is incident on said element; whereby, when no light is incident on said element, said amplifier will damp the oscillator output to a value insufficient to energize said coil.

---

2,773,221
TIMING CIRCUIT
Lloyd E. Shaw, Newburyport, Mass., assignor to Columbia Broadcasting System, Inc., a corporation of New York, doing business as Hytron Radio & Electronics Co., Salem, Mass., a division of Columbia Broadcasting System, Inc.
Application August 12, 1952, Serial No. 303,986
4 Claims. (Cl. 317—135)



1. A timer for opening and closing a circuit comprising, a first normally closed relay and a second normally open relay having their contacts in series relationship in said circuit, a first capacitor in parallel with said first relay, a second capacitor, means for charging said second capacitor, means for applying the charge from said second capacitor directly to the winding of said second relay, and

to the parallel combination of said first relay winding and said first capacitor, whereby said circuit is closed substantially immediately and reopened upon the charging of said first capacitor to a voltage equal to the tripping voltage of said first relay.

---

2,773,222
RELAY ACTUATING CIRCUIT
David M. Chauvin, Glen Burnie, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 14, 1954, Serial No. 429,956
2 Claims. (Cl. 317—149)

1. In combination with a source of voltage pulses, a first electron discharge device having an anode, cathode and at least two grids included therein, one of said grids being a control grid, means for applying said voltage pulses to said control grid, a plate circuit for said discharge device, a first resistor of a magnitude in the order of ten times the plate resistance of said discharge device included in said plate circuit, a second electron discharge device having an anode, a cathode and grid included therein, a connection between the side of said first resistor nearest the anode of said first discharge device and the grid of said second device, means including the energizing coil of a relay and a resistive impedance element in series connecting the cathode of said second device to the other side of said first resistor, a further impedance element connecting the junction of said coil and said first-mentioned impedance element to the cathode of the first electron discharge device, a second resistor connecting the cathode of said first device to the other grid of said first device, and a third resistor of a magnitude in the order of ten times the magnitude of said second resistor connecting said other grid to said other side of the first resistor.

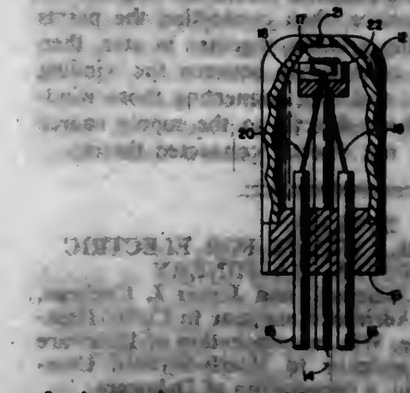
---

2,773,223
HIGH IMPEDANCE TELEPHONE SUBSTATION RINGER
Arthur S. Howell, Rochester, N. Y., assignor, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware
Application May 16, 1955, Serial No. 508,575
17 Claims. (Cl. 317—171)

1. In a telephone ringer, a magnetic base, a core supported from said base, a coil mounted on a portion of said core, and adapted to be energized by ringing current, a bar type permanent magnet having coincident polar and longitudinal axes, said magnet having its ends in fixed abutting relationship with respect to said core and to said base, respectively, a yoke carried by said

base and having spaced-apart parallel portions arranged to constitute pole portions, an armature, and means for supporting said armature in edgewise relation with respect to said pole portions and in operative relation with respect to said core.

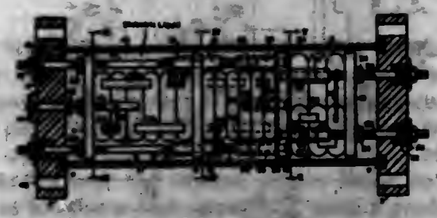
---



2,773,224
TRANSISTOR POINT CONTACT ARRANGEMENT
Kurt Lehovec, Williamstown, Mass., assignor to Sprague Electric Company, North Adams, Mass., a corporation of Massachusetts
Application December 31, 1952, Serial No. 328,948
6 Claims. (Cl. 317—235)

1. A transistor comprising a body of a semiconducting material, means defining at least two closely-spaced apertures through said body, wire probe means passing through said apertures, insulating means separating said wire means from said body in said apertures, point contact means formed on the tips of said probe means, said point contact means forming rectifying contacts with parts of said body about 1 to 5 mils apart.

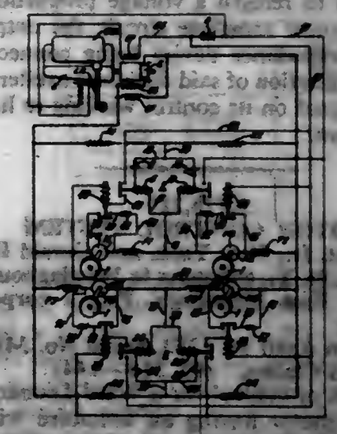
---



2,773,225
SEMICONDUCTOR DEVICE
Robert L. Jones, Danvers, Mass., assignor to Columbia Broadcasting System, Inc., a corporation of New York, doing business under the name of Hytron Radio & Electronics Co., a division of Columbia Broadcasting System, Inc., Danvers, Mass.
Application April 6, 1953, Serial No. 347,061
4 Claims. (Cl. 317—235)

3. A transistor comprising, a cylindrical plastic housing having one open end and an opening formed in the other end thereof, a plug inserted and sealed into said open end, three conducting leads sealed through said plug and insulated from one another, a whisker of beryllium copper mounted on one of said leads within said housing, a whisker of Phosphor bronze mounted on a second of said leads within said housing, said whiskers being mounted on said leads in normally diverging relationship, an L-shaped member mounted on the third of said leads within said housing, one leg of said L-shaped member being parallel to the axis of said cylindrical housing, the other leg being perpendicular thereto, a cube of germanium being mounted on said other leg and facing said open end, and a disk-shaped locating member having an aperture formed therein attached to said L-shaped member and being disposed adjacent said cube, said aperture being larger than the total diameters of said whiskers by a predetermined amount, said whiskers passing through said aperture and being restrained from divergence beyond said predetermined amount, said whiskers each having an S-shaped bend formed therein to cause them to bear upon said cube of germanium with a predetermined pressure, and said opening in said housing permitting the introduction of an impregnating compound.

---



2,773,226
CAPACITOR
Hamilton Brooks, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application August 11, 1953, Serial No. 373,508
5 Claims. (Cl. 317—242)

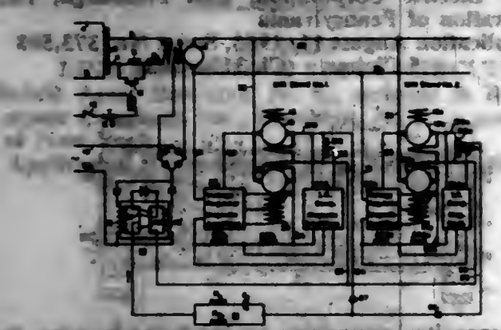
1. A capacitor comprising an insulating housing, insulating end caps closing the ends of the housing, a plurality of capacitor elements disposed in the housing and connected together in a plurality of groups, insulating spacer members separating said groups, a plurality of conducting clamping members engaging the spacer members and extending through the end caps, and means for electrically connecting different groups of capacitor elements to different ones of the conducting members.

---

2,773,227
WHEEL SLIP CONTROL SYSTEM
Torsten O. Lilliedal, La Grange Park, Ill., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application December 17, 1953, Serial No. 398,705
8 Claims. (Cl. 318—52)

7. In a generating electric locomotive having a plurality of traction wheels, a plurality of electric traction motors, each of said motors being connected in driving relation to a traction wheel to drive said plurality of

wheels at equal speeds, a prime mover driven electric generator connected in balanced electrical power circuit relation with said plurality of traction motors when the traction wheels are driven at equal speeds thereby, a normally open shunt circuit including a shunting resistor therein connected across the armatures of each of said motors, and a polarized electrical relay control connected in balanced electric relation with said traction motors and alternately operable upon unbalanced electrical power relations between said motors upon slippage of any traction wheel to complete said shunt circuit around the armature of the motor connected to said slipping traction wheel to reduce its speed and eliminate slippage of the wheel connected thereto.



---

2,773,228

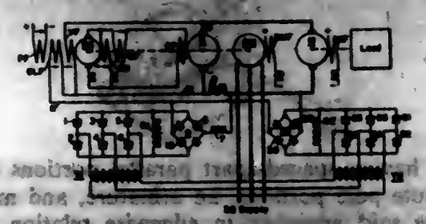
**ELECTRICAL CONTROL SYSTEMS**

Raymond W. Moore, Snyder, and Robert E. Hull, Buffalo, N. Y., and Loren F. Steinger, Pittsburgh, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application October 31, 1953, Serial No. 389,406
26 Claims. (Cl. 318—87)

10. A control system for a motor connected in a loop circuit with a main generator which has its excitation determined by a reference voltage comprising, a reference exciter to determine the reference voltage, field excitation means for said reference exciter, impedance means, means to insert said impedance means in series with said excitation means for the reference exciter and to remove said impedance means from the series circuit, said impedance means having such a magnitude as to reduce the reference voltage at a rate which will tend to cause the motor to decelerate at a rate to cause regenerative current in excess of the permissible amount when inserted in series with said excitation means for said reference exciter, a saturable core impedance device having main windings and a control winding, a differentiating circuit connected in series with the control winding for said saturable core impedance device, said differentiating circuit and control winding being connected to receive a voltage proportional to the current in the motor armature circuit, the output of said saturable core impedance device being connected to determine the energization of said reference exciter in accordance with the signal on its control winding to limit the regenerative current.

---



2,773,229

**MOTOR CONTROL SYSTEM**

William T. Hunt, Jr., New York, and Gerald E. Mathias, Williamsville, N. Y., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application April 16, 1953, Serial No. 348,846
3 Claims. (Cl. 318—144)

1. In a system of control for a Ward-Leonard drive, in combination, a motor having an armature winding and having a field winding, a main generator having a field winding and having an armature winding, said armature winding being connected in a loop circuit with the armature winding of the motor, an impedance connected in the loop circuit, a regulating generator connected to furnish excitation to the main generator field winding, said regulating generator having field winding means normally so excited as to produce a relatively flat voltage characteristic with respect to load on the main generator from no-load to a selected loading of the generator, additional field winding means on the regulating generator

wound to act differentially to the first field winding means, and means for exciting the additional field winding means at a certain rate of increase with a rise in voltage drop across said impedance greater than one selected voltage drop and means for exciting the additional field winding at a greater rate of increase with a rise in voltage drop across said impedance greater than another selected voltage drop which is greater than said first one selected voltage drop.

2,773,230

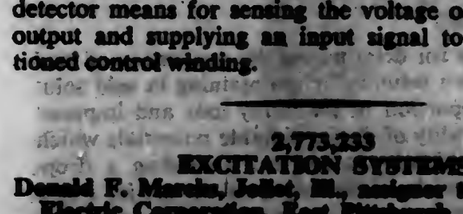
**METHOD OF AND MEANS FOR STARTING PART WINDING MOTORS**

Philip W. Easley, Glendale, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware

Application August 23, 1954, Serial No. 451,527
4 Claims. (Cl. 318—226)

1. The method of starting part winding polyphase induction motors, which comprises first connecting the winding sections of each phase in series and together in star with the supply source, then connecting the points intermediate the winding sections together in star, then interrupting the series connections between the winding sections of each phase, and then connecting those winding sections of each phase directly to the supply source which were previously not directly connected thereto.

---



2,773,231

**SAFETY CONTROL CIRCUIT FOR ELECTRIC MOTOR DRIVEN MACHINERY**

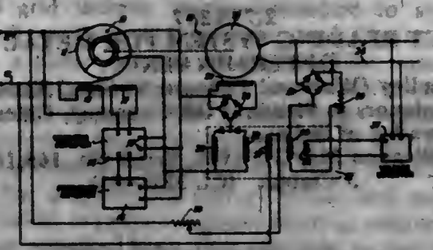
John R. Adriansen, Cincinnati, and James J. Cochran, Dayton, Ohio; said Adriansen assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware and said Cochran, assignor to Harris-Seybold Company, Cleveland, Ohio, a corporation of Delaware

Application July 13, 1954, Serial No. 443,356
2 Claims. (Cl. 318—443)

1. In a safety control circuit for an electric motor the combination of a pair of normally open double pole single throw switches arranged to be closed upon manual depression thereof, said switches being connected in parallel to each other through one set of contacts and in series with each other through the other set of contacts, said one set of contacts being connected in circuit with said motor to provide for actuation thereof upon depression of either said switch, a double pole normally open relay having an energizing coil, an energizing circuit for said relay including said other set of contacts and said coil wired in series with each other for energization of said

coil upon depression of both said switches, circuit means for by-passing all said contacts of said pair of switches upon energization of said relay including both contacts of said relay connected in parallel with said switches, and a holding circuit for said relay including one contact of said relay connected in series with said coil to maintain energization of said coil upon opening of said switches.

---



2,773,232

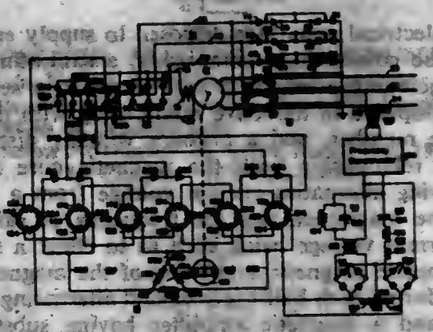
**MOTOR GENERATOR SET**

John A. Herbst, Montville, and Warren J. Dornhoefer, Woodcliff Lake, N. J., assignors to Bogue Electric Manufacturing Co., Paterson, N. J., a corporation of New Jersey

Application May 11, 1954, Serial No. 428,925
3 Claims. (Cl. 322—16)

1. In combination, a direct current motor and an alternator driven by said motor, said motor comprising an armature and slip rings associated therewith for providing an alternating current output, and a field winding, a first magnetic amplifier, frequency detector means for sensing the frequency of said alternating current output and supplying an input signal to said amplifier, said amplifier being energized by said alternating current output and providing an output for energizing said motor field winding, a second magnetic amplifier including a power winding in circuit with said alternating current output and the field winding of said alternator, and a control winding, voltage detector means for sensing the voltage of the alternator output and supplying an input signal to said last mentioned control winding.

---



2,773,233

**EXCITATION SYSTEMS**

Donald F. Marsh, Joliet, Ill., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application April 20, 1954, Serial No. 424,374
9 Claims. (Cl. 322—25)

9. In an excitation system for an alternating-current generator that is provided with a field winding and is disposed to be connected in parallel with another generator, the combination comprising, means for obtaining a measure of the output current of the alternating-current generator, the field winding of the alternating-current generator being responsive to the output of said means, a shunt circuit connected in shunt circuit relationship with the field winding of the alternating-current generator, the shunt circuit also being responsive to the output of the said means and including a voltage responsive impedance member whose impedance is a function of the magnitude of the voltage across the voltage responsive impedance member, to thus prevent excessive excitation of the alternating-current generator under short circuit conditions, a regulator system responsive to the output voltage of the alternating-current generator for controlling the voltage across the field winding of the alternating-current generator, a current transformer having a secondary winding and disposed to be responsive to the output current of the alternating-current generator, circuit

means for so connecting the secondary winding of the current transformer to the regulator system as to provide droop compensation for the alternating-current generator, and another shunt circuit, including two crystal diodes, connected to the secondary winding of the current transformer, the crystal diodes being so interconnected as to offer a high impedance until a predetermined voltage is developed across the secondary winding of the current transformer and once the predetermined voltage is developed the impedance offered by the crystal diodes decreases so that if a large increase in current were to flow through the crystal diodes only a slight increase in voltage would appear across the secondary winding of the current transformer, to thereby prevent excessive droop compensation of the alternating-current generator.

2,773,234

**ELECTRIC DISCHARGE APPARATUS**

William E. Large, Lancaster, N. Y., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application December 29, 1951, Serial No. 264,061
10 Claims. (Cl. 323—24)

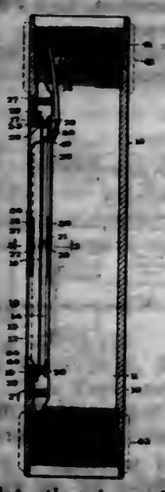
4. In combination, a pair of terminals for supplying a potential; an alternating transformer having a first winding and a second winding; a pair of electric discharge paths each defined by an anode and a cathode connected in inverse-parallel; means connecting said paths, said second winding and said first winding in a closed network; means for connecting in series said terminals, said network and a load, and means for rendering said paths conducting during successive alternate half periods of said potential.

2,773,235

## MAGNETIC AMPLIFIERS

Franklin S. Mallick, Milwaukee, Wis., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application September 2, 1953, Serial No. 378,111
10 Claims. (Cl. 323—69)



1. In electrical apparatus disposed to supply energy to a load, the combination comprising, a saturating transformer including a magnetic core member, a secondary winding disposed in inductive relationship with the magnetic core member, and a primary winding disposed in inductive relationship with the magnetic core member for receiving alternating-current voltage from a suitable source, the magnitude and the frequency of said alternating-current voltage being such as to effect a substantially complete magnetic saturation of the magnetic core member during each half cycle of said alternating-current voltage, and a magnetic amplifier having substantially 100 percent feedback, the magnetic amplifier including magnetic core means, a control winding disposed in inductive relationship with the magnetic core means for receiving a control signal, and a load winding disposed in inductive relationship with the magnetic core means and interconnected between the secondary winding of the saturating transformer and the load, the magnitude of the current flow through the load being substantially independent of the magnitude of said alternating-current voltage applied to the primary winding of the saturating transformer.

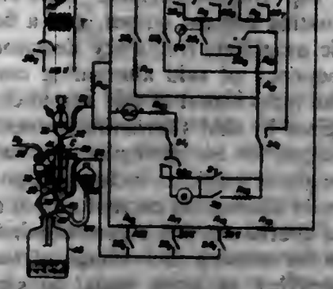
2,773,236

## APPARATUS FOR DETECTING INGRESS AND EGRESS OF FLUID IN A BOREHOLE

R. G. Martin, Houston, Tex., and Ralph D. Wyckoff, Pittsburgh, Pa., assignors, by direct and mesne assignments, to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

Application June 3, 1953, Serial No. 359,358
5 Claims. (Cl. 324—2)

1. Apparatus for detecting irregularities of fluid flow in a borehole containing an electrically-conducting fluid which comprises flow-carrying means adapted to be inserted in the borehole and having a flow channel arranged to transmit at least a part of the fluid flow in the borehole, movable means interposed in said flow channel arranged to be deflected by flow through said channel, a first electrode on said movable means, a second electrode fixedly mounted on said flow-carrying means spaced on one side of said first electrode in the line of movement thereof, a third electrode fixedly mounted on said flow-carrying means spaced on the other side of said first electrode in the line of movement thereof, circuit means including an electrical source for passing an electric current through the fluid via said second and third electrodes, and potential-difference detecting means connected with said circuit means and with said first electrode.



2. Apparatus for measuring flow rate of an electrically-conducting fluid which comprises flow-carrying means having a flow channel arranged to transmit at least a part of the fluid flow, movable means interposed in said flow channel arranged to be deflected by flow through said channel, a first electrode immersed in the flowing fluid and mounted on said movable means, a second electrode immersed in the flowing fluid and fixedly mounted on said flow-carrying means and spaced on one side of said first electrode in the line of movement thereof, an electrical conductor contacting the fluid, an electric circuit including means for establishing a difference of potential between two points of said circuit, means electrically connecting one of said circuit points to said conductor, means electrically connecting the other of said circuit points to one of said electrodes whereby an electric current will flow through the fluid, and potential-difference detecting means responsive to the potential difference between the other of said electrodes and a point of said circuit whose potential change as a result of motion of said movable means is different from the potential change of said other electrode as a result of the same motion of said movable means.

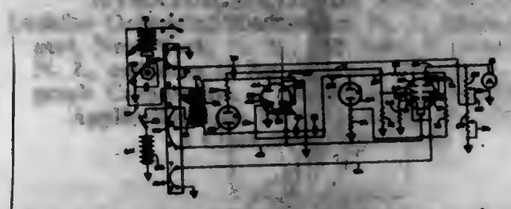
2,773,237

## DIRECT READING SYSTEM FOR METAL ION DETERMINATION

Elmer Bradley Offutt and Leonard V. Sorg, Kansas City, Mo., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

Application May 31, 1950, Serial No. 165,164
3 Claims. (Cl. 324—31)

1. An apparatus for determining the proportion of lead ions in an unknown solution by maintaining in said solution a known proportion of antimony ions and impressing stepwise a plurality of distinguishable potentials which comprises in combination a test cell including a dropping mercury electrode, a mercury pool electrode, a first conductor connected to said dropping mercury electrode and a second conductor connected to said mercury pool electrode, a source of potential, a circuit including said test cell, a plurality of individually controlled dividers of the potential from said source, a plurality of gang switches, a plurality of voltage balancing means in said circuit selectively controlled by said gang switches, a means in said circuit adapted to indicate electrical balance and unbalance of said circuit, said voltage balancing means including potentiometer means associated with each of said potential dividers for balancing the circuit and thereby measuring the electrical current passing through said test cell, and switch means for selectively impressing potentials from said potential dividers of about 0.05 to 0.1 volt, about 0.25 to 0.4 volt, and about 0.6 to 0.8 volt across said electrodes.



2,773,238

## ELECTRICAL TACHOMETER FOR INTERNAL COMBUSTION ENGINES

Merlin O. Peterson, Grayslake, and Thomas E. Bjorn, Chicago, Ill., assignors to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia

Application September 17, 1953, Serial No. 380,702
8 Claims. (Cl. 324—70)

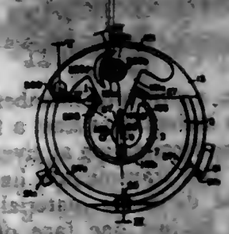
1. An electrical tachometer adapted to be interconnected with the ignition system of an internal combustion engine and comprising, in combination, a power supply and electrical isolation transformer having a low impedance primary winding adapted to be connected in series with the ignition system, rectifier and filtering circuit means connected to receive the output voltage of the transformer secondary, voltage limiting means connected to limit the output voltage of the rectifier and filtering circuit means to a uniform value, frequency meter means including a vacuum tube amplifier having a control grid therein, means connected to apply the output voltage from said rectifier and filtering circuit means as a plate potential on the amplifier, means connected to apply voltage pulses from said transformer secondary to the amplifier control grid, rectifier tube means connected to rectify the output of said amplifier tube means, means interconnected with the output of said rectifier and filtering circuit means and said rectifier tube means to apply a reduced bucking voltage against the voltage supplied from said amplifier to said rectifier tube means, and a graduated ammeter connected to the output of said rectifier tube means.

2,773,239

## ELECTRICAL INDICATING INSTRUMENTS

Louis W. Parker, Great Neck, N. Y.

Application May 14, 1952, Serial No. 287,704
18 Claims. (Cl. 324—150)



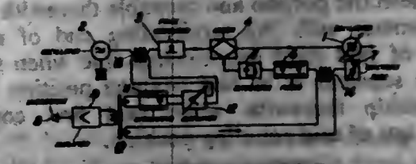
1. An electrical measuring instrument comprising a disc of conducting material, two coils mounted on one face of the disc with their centers on a common diameter and said centers being on opposite sides of the center of the disc, two coils mounted on the other side of the disc respectively substantially coaxial with two coils on the first side of the disc, said disc being metallic and having the surfaces of both of its faces composed of an insulating compound that includes part of the metal of the disc and is bonded to the metal of the disc and the coils being lines of conducting material on the surface of the insulating compound, means connecting said coils in series with the fields of complementary coaxial coils additive and the fields of coils on opposite sides of the center of the disc being in opposite directions, means for biasing the disc to zero position, U-shaped magnet means on each side of said disc for producing magnetic flux through the disc parallel to the axis thereof with increasing field strength along the path of rotation of the coils, said magnet means producing flux in one direction through the coils on one side of the center of the disc and in the opposite direction through the coils on the other side of the center of the disc, and means for indicating the rotary position of the disc.

2,773,240

## MOVING-COIL ELECTRICAL INSTRUMENTS

Douglass A. Young, East Orange, N. J., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application November 18, 1950, Serial No. 196,429
13 Claims. (Cl. 324—150)



1. In an electroresponsive device, a magnetic structure comprising a magnetic core member, a pole piece member spaced from the core member for defining an air gap therebetween, and means for establishing a magnetomotive force between said members to provide a magnetic field in the air gap, a coil having a coil side in said air gap, means mounting the coil for movement about a first axis relative to the magnetic structure to carry the coil side through the air gap, and mechanism mounting one of said members for adjustable movement relative to the other of said members and relative to the first-named means about a second axis substantially parallel to the first axis, said coil side being substantially included in a plane defined by said axes when the coil side is substantially at one end of the path of its movement.

2,773,241

## AUTOMATIC FREQUENCY CONTROL

Edward Herman Hagenbeek, Hilversum, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application May 22, 1953, Serial No. 356,781
Claims priority, application Netherlands May 27, 1952
7 Claims. (Cl. 332—19)

1. A stabilized frequency-modulation apparatus comprising a source of alternating control voltage, means for producing stabilization pulses at a repetition rate corresponding to the frequency of said alternating control voltage, a high-frequency oscillator for producing a high-frequency alternating voltage at a harmonic frequency of the frequency of said alternating control voltage, a frequency modulator coupled to said oscillator to control the frequency thereof, a mixing stage connected to receive and mix said stabilization pulses and said high-frequency alternating voltage and produce therefrom

pulses forming an automatic frequency control voltage, said mixing stage being normally cut off and being released only upon the occurrence of said stabilization pulses, an automatic frequency control circuit comprising an integrating network and a low-pass filter, means for feeding said automatic frequency control voltage successively through said integrating network and low-pass filter and to said frequency modulator, a source of modulation voltage, a phase modulator connected to modulate the positions of said stabilization pulses in response to said modulation voltage, and means coupling said modulation voltage to said frequency modulator independently of said automatic frequency control circuit.

---

2,773,242

**MICROWAVE SWITCHING ARRANGEMENTS**

Donald D. Grieg, North Caldwell, N. J., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland

Application April 2, 1952, Serial No. 280,165
2 Claims. (Cl. 333—7)

1. In combination, a switching member and a plurality of transmission lines including at least a first, second and third transmission line terminating at given distances from each other, each of said transmission lines comprising a planar strip of solid dielectric material, a first planar conductor lying flat against one face of said dielectric strip, a second planar conductor lying flat against the opposite face of said dielectric strip, said conductors extending parallel to each other, said dielectric strips spacing said conductors a fraction of a quarter wavelength apart, said second conductor being wider than the corresponding first conductor so that the electric field of a wave traveling along said transmission line is distributed between said conductors in a manner approximating the TEM mode, said switching member comprising a transmission line segment including a first conductive segment, a second wider conductive segment, a dielectric member extending the full length between said segments and separating them by a thickness of dielectric which is equal to the thickness of said dielectric strips, at least a portion of said dielectric member being movable, said first conductive segment being carried by said movable dielectric portion into and out of coupling position in which it couples together said first conductors of said first and second transmission lines, said second conductive segment of said switching member coupling said second conductor of said first and second transmission lines to the second conductor of said third transmission line, and a terminating impedance embedded in and terminating in the dielectric for absorbing microwave energy propagated along the line and carried on said movable dielectric portion and movable therewith into immediate contact with the terminating end of said first conductor of said third transmission line when said first conductive segment is in said couping position and out of relationship therewith when said first conductive segment is out of said coupling position.

---

2,773,243

**WAVE GUIDE WITH DUAL PURPOSE GAS DISCHARGE DEVICE**

Ladislas Goldstein, Urbana, Ill., and Herbert F. Engelmann, Mountain Lakes, N. J., assignors to International Telephone and Telegraph Corporation, a corporation of Maryland

Application July 25, 1952, Serial No. 300,998
3 Claims. (Cl. 333—13)

1. A combination T-R and attenuating switch gas discharge device system providing selective T-R action and attenuation of low-power radio-frequency energy comprising means defining a resonant chamber, an ionizable gas filling said chamber, first and second electrodes disposed within said chamber and insulated from one another for direct current and electrically connected to the means defining a resonant chamber at radio frequency, means to couple a source of biasing voltage between said first and second electrodes whereby said electrodes serve as keep-alive electrodes, and a third electrode spaced from said first and second electrodes and insulated therefrom, said first and third electrodes being so disposed that high-power radio-frequency energy propagating through said

chamber will cause ionization of said gas and a discharge directly between said first and third electrodes, low-power radio-frequency energy being insufficient of itself to cause said discharge, a source of voltage, and switching means operable independently of high-power radio-frequency energy propagating through said chamber to couple said source of voltage between said first and third electrodes whereby during the on period of operation of said switching means low-power radio-frequency energy propagating through said chamber will cause a discharge directly between said first and third electrodes thereby attenuating said energy in its passage through the chamber.

---

2,773,244

**BAND PASS FILTER**

Donald D. Grieg, North Caldwell, N. J., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland

Application August 2, 1952, Serial No. 302,292
1 Claim. (Cl. 333—73)

A microwave bandpass filter comprising a hollow waveguide filter of the distributed parameter type having signal input and output sections, each of said sections having an opening therein, a coaxial transmission line coupled between said sections with the inner conductor thereof extending through the openings into said sections to provide a bypass communication about said waveguide filter to bypass a portion of the signal energy from said input section to said output section to reduce the selectivity of the filter during tuning adjustments, and means to interrupt the bypass communication after tuning to introduce the selectivity characteristics of said filter, said bypass coaxial transmission line including a coupling section coupled to each of said input and output sections and a central section coupled between said coupling sections, the center conductor of said coupling sections being disposed in sliding contact relation with the ends of the center conductor of said central section, the ends of the center conductor of said coupling sections extending through the opening in said input and output sections to provide a

probe type coupling in said input and output sections, said coupling sections being extended beyond the point of sliding contact with the center conductor of said central section, said means included in this extended portion to short the inner and outer conductors of said coupling sections to provide a quarter wave choke section therein at the operating frequency of said filter to cooperate in impedance matching, and said means to interrupt bypass communication includes means coupled to the center conductors of said coupling sections to control the probe lengths thereof extending into said input and output sections.

---

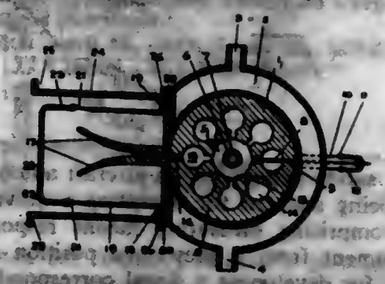
2,773,245

**GYRATOR METHODS AND MEANS**

Ladislas Goldstein, Weehawken, N. J., Murray A. Lampert, New York, N. Y., and John F. Heney, Clifton, N. J., assignors to International Telephone and Telegraph Corporation, a corporation of Maryland

Application June 18, 1951, Serial No. 232,148
3 Claims. (Cl. 333—98)

1. A method for rotating the polarization of a plane-polarized wave propagated in a waveguide structure and for maintaining the attenuation at a low value, said waveguide structure having an ionizable body of a gaseous medium therein and means for establishing a magnetic field having a major component substantially parallel to the longitudinal axis of said waveguide disposed thereabout to interact with the electrons of said gaseous medium, comprising propagating a guided electromagnetic wave having a given signal frequency within said waveguide, maintaining said magnetic field at an intensity which establishes an electron gyromagnetic frequency within said gaseous medium above the signal frequency of said propagated wave, and pulsing the ionization thereof to establish a decaying gas discharge plasma within said gaseous medium whereby the electric field of said electromagnetic wave interacts with the electrons of the decaying gas discharge plasma, the duration of said decaying gas discharge plasma being prolonged for a period of time so that its electron temperature is decreased to substantially that of the un-ionized gas.



---

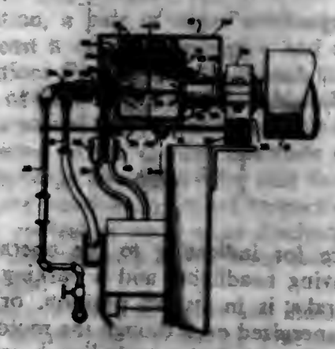
2,773,246

**SEALED SAPPHIRE WAVE GUIDE WINDOW**

Frank Brook, Barrow, England, assignor to The General Electric Company Limited, London, England, a British company

Application October 16, 1952, Serial No. 315,113
Claims priority, application Great Britain October 19, 1951
3 Claims. (Cl. 333—98)

1. An electrical device including a hollow metal tube arranged to act as a waveguide carrying high frequency energy in operation of the device and closed by a thin closure member of insulating material, said closure member consisting of a central flat sapphire disk and an annular glass piece, the outer periphery of said annular glass piece being sealed to the metal tube and the inner periphery of said annular glass piece being sealed to the periphery of the sapphire disk.



---

2,773,247

**CURRENT COLLECTOR FOR ROTARY SHAFT OF ELECTROPLATING APPARATUS**

John E. Erhardt, Jr., Baltimore, Md., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York

Application October 3, 1951, Serial No. 249,511
3 Claims. (Cl. 339—5)

1. In apparatus having a current roll for electro-plating and the like, a shaft extending from the current roll at one end thereof, a bearing having a cap portion for rotatably supporting the shaft, a current transfer device frame supported by the bearing, a cylindrical current transfer shoe supported on the shaft, a plurality of brushes mounted on the frame and positioned to ride against the cylindrical surface of the current transfer shoe, the transfer shoe being supported on the shaft by means of a split coupling, one portion of the split coupling being removable from engagement with the shoe and shaft to permit movement of the shaft away from the shoe in a direction transverse to the axis of the shoe, the arrangement being such that removal of the said bearing cap and the said one portion of the split coupling will permit removal of the current roll and shaft from the shoe while the shoe remains substantially in its original position with respect to the brushes and said frame and brushes remain in alignment with said bearing.

---

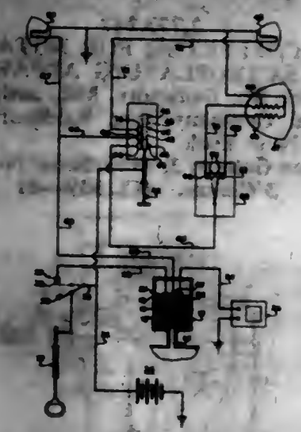
2,773,248

**WIRING DEVICE**

Clarence M. Smith, Trumbull, Conn., assignor to The Bryant Electric Company, Bridgeport, Conn., a corporation of Connecticut

Application May 5, 1954, Serial No. 427,733
11 Claims. (Cl. 339—164)

1. A wiring device comprising a hollow casing of insulating material having a terminal located in fixed relationship therein, said terminal having a plurality of resilient staggered jaws each of which is spaced a different distance from a movable jaw so that each staggered jaw forms a spaced pair of jaws in conjunction with said movable jaw, each of said pair of jaws being spaced to receive a known size inserted conductor therebetween, means whereby a conductor may be inserted between any one of said pairs of jaws from the exterior of said casing, and an opening in said casing adjacent said movable jaw so that said movable jaw is accessible to be moved and thereby release said inserted conductor from said one pair of jaws.



2,773,249

**REMINDER TO DISCONNECT VEHICLE LIGHTS OR TO SET THE HAND BRAKE**

Ernest R. De Sanlis, Glenolden, Pa.

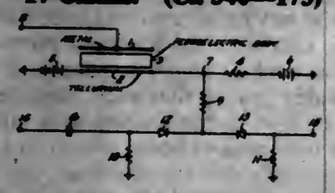
Application January 31, 1955, Serial No. 485,110

1 Claim. (Cl. 340—52)

A device for indicating to the operator of a motor vehicle having headlights and a parking brake, that the parking brake is in its off position, or that the headlights are energized even though the motor of said vehicle is turned off, said device including a casing, a conducting plate movably mounted in said casing, means normally biasing said plate to a first position within said casing, means connecting said casing to the suction manifold of the motor whereby said plate is moved to a second position within said casing when the motor is operating, a first, a second and a third terminal, all of said terminals being fixed in a common plane within said casing and arranged for simultaneous contact with said plate when said plate is in said first position, an electrically operated signal, a first conductor connecting said first terminal to said signal, a first circuit for energizing said headlights, a first switch included in said first circuit, a second conductor connecting said second terminal to said first circuit through said first switch, a second circuit including a second switch, means connecting said second circuit to said parking brake in such a manner that said second switch is opened when the parking brake is in its on position and closed when said brake is in its off position, a conductor connecting said third terminal to one side of said second switch, and means connecting either of said circuits to the electric system of the vehicle subject to the control of either of said switches.

2,773,250

**DEVICE FOR STORING INFORMATION**



Pierre Raoul Roger Aigrain and Georges Benoit Antoine Liandrat, Paris, France, assignors to International Standard Electric Corporation, New York, N. Y., a corporation of New York

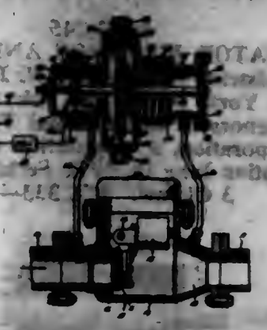
Continuation of abandoned application Serial No. 426,173, April 28, 1954. This application May 5, 1955, Serial No. 526,927

Claims priority, application France May 13, 1953

(Filed under Rule 47(b) and 35 U. S. C. 118)

17 Claims. (Cl. 340—173)

1. An information storing device characterized in this that said device comprises a condenser having a first electrode of metal, a second electrode of a thin layer of a semi-conductor containing impurities of the p type, and a dielectric body of a ferro-electric material between said electrodes, means for applying electric potentials to said first electrode, and means for detecting variations in the electrical characteristics of said second electrode which take place in response to potentials applied to said first electrode.



2,773,251

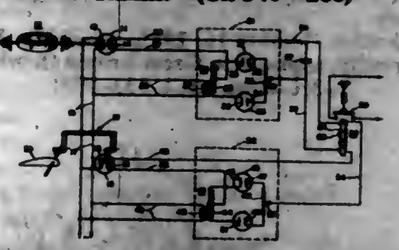
**BACKFLOW PREVENTION AND ALARM DEVICE**

Leonard L. Snyder, Los Angeles, Calif., assignor to Backflow Engineering & Equipment Co., a copartnership

Application November 24, 1952, Serial No. 322,327

5 Claims. (Cl. 340—242)

1. In a device for use with a check valve connecting a supply conduit to a consumers conduit, the check valve having a movable closure establishing a pressure drop from the supply conduit to the consumers conduit under conditions of normal flow therethrough and establishing a certain value of pressure differential at cessation of flow, the combination of: a differential pressure switch having a diaphragm interposed between two chambers, relatively movable electrical contact elements connected for operation by said diaphragm, piping connecting one of the said chambers to reflect pressure in the supply conduit and connecting the other of the chambers to reflect pressure in the consumers conduit, whereby the contacts are closed whenever the pressure in the consumers conduit approaches the pressure in the supply conduit within the range between zero p. s. i. differential and said certain value of pressure differential established by the movable closure at cessation of flow, and an electrical circuit having an alarm device in series with said contact elements.



2,773,252

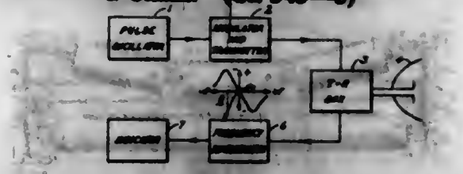
**AUTOMATIC PILOT MONITOR**

Paul A. Noxon, Teaneck, and John C. Owen, Palisades Park, N. J., assignors to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware

Application October 21, 1949, Serial No. 122,791

7 Claims. (Cl. 340—268)

1. A safety system for an aircraft automatic pilot, the latter being adapted for operating a movable craft surface, comprising measuring means responsive to craft displacement from a prescribed position about an axis thereof for developing a signal corresponding in amount and direction to the amount and direction of craft displacement from the prescribed position, a second measuring means separate and distinct from the automatic pilot responsive to surface movement by said automatic pilot as a result of automatic pilot operation for developing a signal corresponding in amount and direction to the amount and direction of surface movement by said automatic pilot, and monitor means connected for operation by said signals for monitoring the operation of said automatic pilot.



2,773,253

**METHOD OF DETECTING DISCONTINUITIES IN THE REFLECTIVE PROPERTIES OF SURFACES**

David E. Sunstein, Cynwyd, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania

Application August 24, 1946, Serial No. 692,851

1 Claim. (Cl. 343—5)

In a radar system comprising a transmitter of high frequency energy, a receiver of reflections of said transmitted energy from target objects and an indicator for indicating the relative intensities of said reflections, the method of enhancing the indications produced by said indicator in response to reflections of said transmitted energy from target objects at which substantial discontinuities in reflective properties obtain, which comprises: transmitting signals comprising a band of frequency components, said band being of sufficient width to cause transmitted signals reflected from a target region at which a discontinuity in reflective properties in excess of a predetermined minimum obtains to undergo a momentary shift in frequency in excess of a predetermined shift in frequency undergone by signals reflected from targets moving radially with respect to said transmitter at a predetermined maximum velocity, reflecting said transmitted signals from target regions at which said discontinuities in reflective properties obtain thereby to produce shifts in the frequency of the reflected signals in excess of the shift in frequency undergone by said signals in response to reflection from targets moving radially with respect to said transmitter at said predetermined minimum velocity, and modifying the intensities of signals received by said receiver differently as a function of their frequencies and so as to enhance the intensities of signals which have been subjected to relatively greater frequency shift by reflection from target regions at which substantial discontinuities in reflective properties obtain relative to the intensities of signals which have been subjected to no appreciable frequency shift or to lesser frequency shift by reflection from targets moving radially with respect to said transmitter.

2,773,254

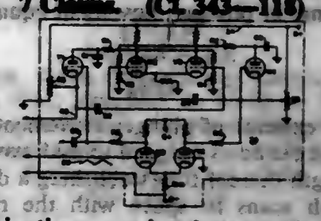
**PHASE SHIFTER**

Herbert F. Engelmann, Mountain Lakes, N. J., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland

Application April 16, 1953, Serial No. 349,118

11 Claims. (Cl. 343—100)

1. An antenna for radiating circularly polarized electromagnetic waves comprising a ground conductor having a planar surface, dielectric material in the form of a disc, and a conductor in the form of a planar helix carried by said disc in substantially parallel relation to the planar surface of said ground conductor.



2,773,255

**ELECTRONIC DETECTING AND INDICATING SYSTEM**

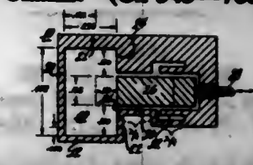
Ward M. Meier and Basil M. Lide, Baltimore, Md., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application October 27, 1950, Serial No. 192,506

7 Claims. (Cl. 343—118)

1. In combination, a pair of space discharge devices each having at least a cathode, an anode and a control electrode, connections from the anode of each tube to the control electrode of the other to provide a bi-stable multivibrator circuits, a pair of pulse-forming gaseous discharge tubes each connected to the control electrode of an associated space discharge device to drive said devices into non-conducting and conducting states respectively, and means under the control of each space discharge device for disabling the non-associated tube when said device is in a conducting state.

5. In combination, a radio detection and indicating system of the type employing a scanning antenna and an oscilloscopic indicator of the plan position type, means for deriving a periodic voltage wave having a different magnitude corresponding to each scan position of said antenna, and means controlled by said voltage wave for periodically brightening a trace of said indicator corresponding to a predetermined point in the excursion of said antenna, said means controlled by said voltage wave comprising a bi-stable multivibrator circuit, pulse forming means responsive to a condition of said voltage wave for triggering said circuit from a first stable condition to another stable condition at a first predetermined point on said voltage wave, and pulse forming means responsive to a different condition of said voltage wave for restoring said circuit to its original condition at a second predetermined point on said voltage wave.



2,773,256

**SCANNER WAVE GUIDE**

John R. Ford, Narberth, Pa., and Richard W. Howery, Haddonfield, N. J., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Air Force

Application November 30, 1950, Serial No. 198,306

6 Claims. (Cl. 343—768)

1. An electromagnetic energy scanning apparatus comprising, a rectangular hollowpipe waveguide having a longitudinal axis and including a waveguide section a plurality of wavelengths long at the operating frequency, said waveguide section having three fixed walls and a fourth wall having a portion thereof adapted to receive a movable metallic plunger, a metallic plunger extending the length of said waveguide section transversely movable through said fourth wall in a direction normal to said axis toward and away from the wall opposite said fourth wall for varying the wave velocity of energy propagated in said waveguide section, said waveguide section having effective dimensions $a_1$ and $b_1$ and energy propagated therethrough having a guide wavelength of $\lambda_{g1}$ when said plunger is at one extreme of said transverse movement, said waveguide section having effective dimensions of $a_2$

and $b_2$ and energy propagated therethrough having a guide wavelength of $\lambda_{g2}$ when said plunger is at the other extreme of said transverse movement,

$$\frac{\lambda_{g2}}{a_2^2 b_2}$$

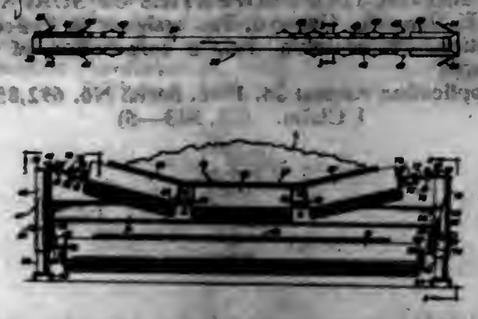
for one extreme of plunger movement equalling

$$\frac{\lambda_{g2}}{a_2^2 b_2}$$

for the other extreme of plunger movement, and a plurality of antenna elements coupled to said waveguide section along the length thereof for establishing a directive energy pattern which scans in space with the motion of said plunger.

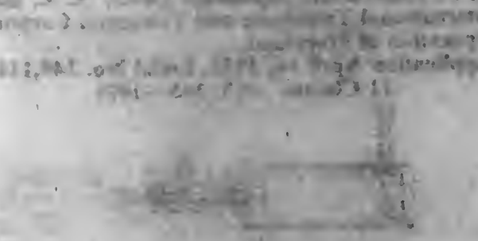
---

**2,773,257**



**CONVEYOR HAVING FLEXIBLE STRAND SIDE FRAMES AND TROUGHING ROLLER ASSEMBLY THEREFOR**

Joseph Crapps and Keith McCann, Taylorville, Ill., assignors to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois



Continuation of application Serial No. 521,355, July 11, 1955. This application July 27, 1956, Serial No. 600,418

40 Claims. (Cl. 198—192)

1. In a belt conveyor having flexible strand means trainable along a course, supporting means for supporting said flexible strand means, an elongated belt carrying anti-friction means adapted to have the load carrying run of a movable belt supported for movement thereacross, said anti-friction means being flexible in a direction transverse to the length thereof, connecting means connecting said anti-friction means to said strand means remote from said supporting means for concurrent flexing movements of the strand means and anti-friction means under loads applied to said anti-friction means; said flexible strand means, flexible anti-friction means, and connecting means cooperating to absorb impact by the cumulative flexing of said flexible anti-friction means and of said flexible strand means remote from said supporting means.

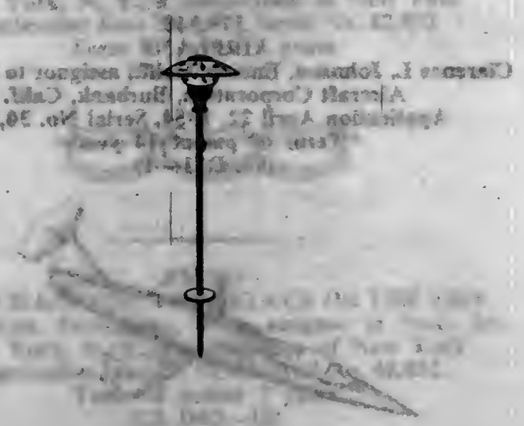
# DESIGNS

## DECEMBER 4, 1956

**179,336**
**GIRDLE**

Anna Y. Bayer, North Haven, Conn., assignor to The Strouse Adler Company, New Haven, Conn., a corporation of Connecticut

Application August 6, 1956, Serial No. 42,528
Term of patent 14 years
(Cl. D26—2)



---

**179,337**
**GARDEN LAMP**

Thornton H. Brown, Essex, Conn., assignor to Verplex Company, Essex, Conn., a corporation of Connecticut

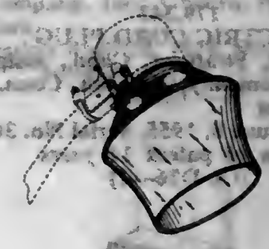
Application March 14, 1956, Serial No. 40,611
Term of patent 3½ years
(Cl. D48—31)

---

**179,338**
**ASH TRAY**

John G. Clarke, Toledo, Ohio, assignor to Owens-Illinois Glass Company, Toledo, Ohio, a corporation of Ohio

Application October 19, 1955, Serial No. 38,455
Term of patent 3½ years
(Cl. D85—2)



---

**179,339**
**LUMINAIRE**

Philip B. Clark, Hales Corners, and Donald W. Harling, Milwaukee, Wis., assignors to McGraw Electric Company, Milwaukee, Wis., a corporation of Delaware

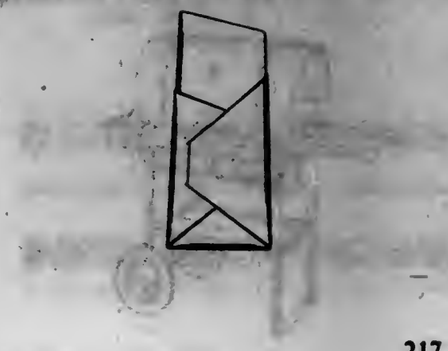
Application April 30, 1956, Serial No. 41,247
Term of patent 14 years
(Cl. D48—31)

---

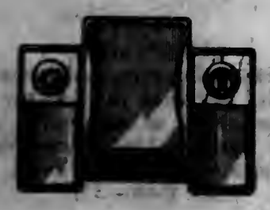
**179,340**
**CLOCK**

Dominic J. Delpidio, Belmont, Mass.

Application April 18, 1956, Serial No. 41,117
Term of patent 14 years
(Cl. D42—7)

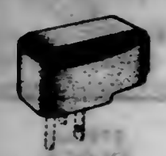


---



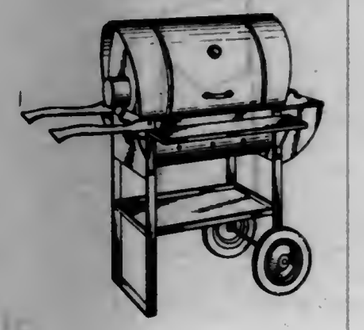
**179,341**
**SPECTACLE CASE**

Robert G. De Weese, Rochester, N. Y., assignor to Sharon Optical Company, Inc., Geneva, N. Y., a corporation of New York



Application May 7, 1956, Serial No. 41,367
Term of patent 14 years
(Cl. D57—1)

179,342
**TELEPHONE TRAY**
Leo Flicht, Skokie, Ill., assignor to M and M Corporation, Skokie, Ill., a corporation of Illinois
Application April 25, 1956, Serial No. 41,198
Term of patent 14 years
(Cl. D26—14)



179,343
**ELECTRIC CORD PLUG**
Andrew J. Gesmer, Stratford, Conn., assignor to The Whitney Blake Company, Hamden, Conn., a corporation of Connecticut
Application June 8, 1955, Serial No. 36,426
Term of patent 14 years
(Cl. D26—1)

179,344
**COVER FOR A BOX**
Benjamin Greenstein, Bronx, and Carl Molk, New York, N. Y.
Application September 19, 1955, Serial No. 37,988
Term of patent 7 years
(Cl. D58—11)

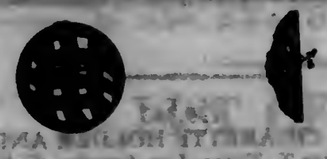
179,345
**OUTDOOR STOVE**
Larry S. Henry and George F. Henry, Morton Grove, Ill., assignors to George Henry Company, Morton Grove, Ill., a corporation of Illinois
Application November 29, 1955, Serial No. 39,076
Term of patent 14 years
(Cl. D61—10)

179,346
**KNOB ROSE**
Glen Holland, Villanova, Pa.
Application March 23, 1956, Serial No. 40,759
Term of patent 3½ years
(Cl. D50—6)

179,347
**XYLOPHONE**
Grover C. Jenkins, Decatur, Ill., assignor to G. C. Jenkins Co., Decatur, Ill.
Application February 3, 1955, Serial No. 34,347
Term of patent 3½ years
(Cl. D56—1)

179,348
**AIRPLANE**
Clarence L. Johnson, Encino, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Application April 22, 1954, Serial No. 30,122
Term of patent 14 years
(Cl. D71—1)

179,349
**CHRISTMAS ORNAMENT**
Ralph O. Johnson, Bristol, Conn., assignor to Associated Spring Corporation, Bristol, Conn., a corporation of Delaware
Application August 18, 1955, Serial No. 37,558
Term of patent 14 years
(Cl. D29—1)



179,350
**SHOE OR SIMILAR ARTICLE**
Felo Joyce, Pasadena, Calif., assignor to Joyce, Inc., Pasadena, Calif., a corporation of California
Application May 5, 1955, Serial No. 35,829
Term of patent 3½ years
(Cl. D7—7)

179,351
**BROOCH OR THE LIKE**
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application June 25, 1956, Serial No. 42,021
Term of patent 7 years
(Cl. D45—19)

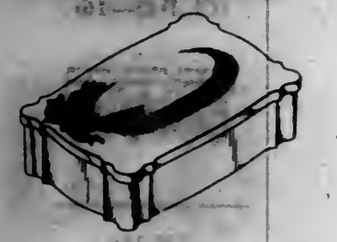
179,352
**LINK CHAIN FOR A NECKLACE OR THE LIKE**
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application June 25, 1956, Serial No. 42,031
Term of patent 7 years
(Cl. D45—16)

179,353
**LINK CHAIN FOR A NECKLACE OR THE LIKE**
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application June 25, 1956, Serial No. 42,032
Term of patent 7 years
(Cl. D45—16)

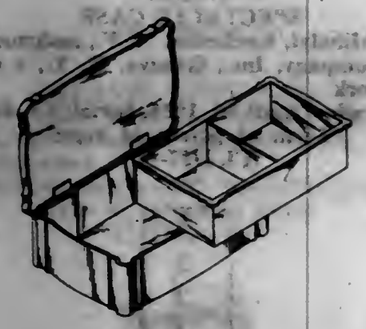
179,354
**LINK CHAIN FOR A BRACELET OR THE LIKE**
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application June 25, 1956, Serial No. 42,033
Term of patent 7 years
(Cl. D45—4)

179,355
**LINK CHAIN FOR A NECKLACE OR THE LIKE**
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application June 25, 1956, Serial No. 42,035
Term of patent 7 years
(Cl. D45—16)

179,356
**SPECTACLE CASE**
Richard F. Mihalyi, Rochester, N. Y., assignor to Sharon Optical Company, Inc., Geneva, N. Y., a corporation of New York
Application April 16, 1956, Serial No. 41,076
Term of patent 14 years
(Cl. D57—1)

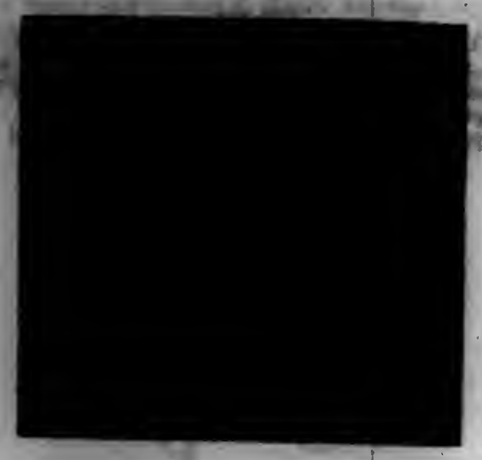


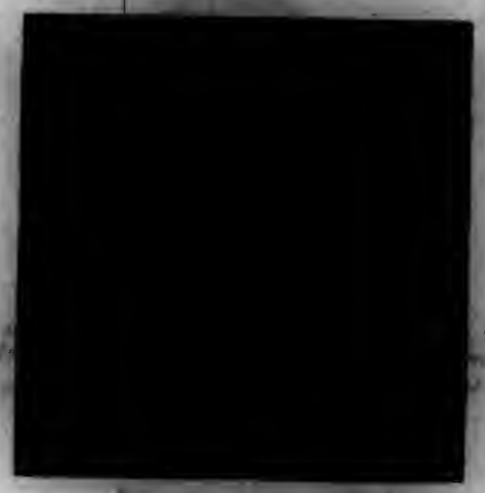
179,357
**FENDER FLAP FOR AUTOMOBILES**
Harold Price, Chicago, Ill.
Application March 3, 1955, Serial No. 34,856
Term of patent 3½ years
(Cl. D14—6)



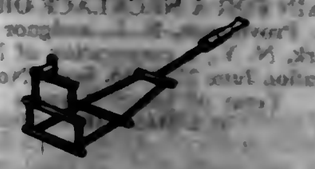
179,358
**EXPANSIBLE WRISTWATCH BRACELET**
John F. Sand, Convent Station, N. J., assignor, by mesne assignments, to The Gemex Corporation, Union, N. J., a corporation of New Jersey
Application August 2, 1954, Serial No. 31,714
Term of patent 14 years
(Cl. D45—4)

179,359
**PLASTIC CIGARETTE BOX**
John Schwarz, Glendale, Calif.
Application July 2, 1956, Serial No. 42,123
Term of patent 14 years
(Cl. D85—2)

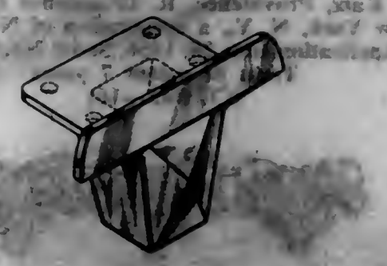




179,360
**COMBINED DISPLAY STAND AND PICTURE PROJECTOR**
James W. Small, Chicago, Ill.
Application October 10, 1955, Serial No. 38,316
Term of patent 3½ years
(Cl. D60—9)



179,361
**TEXTILE**
Leslie Tillett, New York, N. Y., assignor to Golding Bros. Company, Inc., New York, N. Y., a corporation
Application August 31, 1956, Serial No. 42,801
Term of patent 3½ years
(Cl. D92—1)



179,362
**TEXTILE**
Leslie Tillett, New York, N. Y., assignor to Golding Bros. Company, Inc., New York, N. Y., a corporation
Application August 31, 1956, Serial No. 42,802
Term of patent 3½ years
(Cl. D92—1)

179,363
**COMBINED CIGARETTE HOLDER AND FILTER**
Booker T. Tyree, Los Angeles, Calif.
Application May 21, 1956, Serial No. 41,572
Term of patent 14 years
(Cl. D85—8)

179,364
**SUPPORT FOR FURNITURE**
Forest Wilson, Chicago, Ill.
Application August 1, 1955, Serial No. 37,258
Term of patent 3½ years
(Cl. D33—1)

179,365
**TELEPHONE DIALER OR THE LIKE**
Cecil B. Woofter, Minneapolis, Minn., assignor to U. O. Colson Company, Paris, Ill., a corporation of Delaware
Application May 17, 1956, Serial No. 41,526
Term of patent 14 years
(Cl. D26—14)

# LIST OF REISSUE PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 4TH DAY OF DECEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Ager, Dres. Roof gutter. Re. 24,245, 12–4–56, Cl. 108—28.
Bodner, Hyman: *See*—
Kaplan, Yale, and Ross. Re. 24,251.
Creo-Dipt Co., Inc.: *See*—
Fink, Carl J., and Heintz. Re. 24,246.
Driver-Harris Co.: *See*—
Lohr, James M. Re. 24,242.
Lohr, James M. Re. 24,243.
Lohr, James M. Re. 24,244.
Fink, Carl J., and C. E. Heintz, to Creo-Dipt Co., Inc. Multiple shingle structure. Re. 24,246, 12–4–56, Cl. 106—6.
Gehrig, Walter. Combined weights and assembly members. Re. 24,247, 12–4–56, Cl. 42—43.1.
General Motors Corp.: *See*—
Hansen, Kai H. Re. 24,248.
Hansen, Kai H., to General Motors Corp. Independent vehicle wheel suspensions. Re. 24,248, 12–4–56, Cl. 267—8.
Heintz, Charles E.: *See*—
Fink, Carl J., and Heintz. Re. 24,246.
Hogue, Ephraim W. Hydraulic motors. Re. 24,252, 12–4–56, Cl. 121—56.
Johnson, Milton M. Railway journal box stabilizer. Re. 24,249, 12–4–56, Cl. 308—40.
Kaplan, Yale, and H. M. Ross, ½ to H. Bodner. Dispensing containers for liquids. Re. 24,251, 12–4–56, Cl. 222—107.
Lohr, James M., to Driver-Harris Co. Alloys and electrical resistance elements. Re. 24,242, 12–4–56, Cl. 75—171.
Lohr, James M., to Driver-Harris Co. Alloys and electrical resistance elements. Re. 24,243, 12–4–56, Cl. 75—124.
Lohr, James M., to Driver-Harris Co. Alloys and electrical resistance elements. Re. 24,244, 12–4–56, Cl. 75—171.
Ross, Harold M.: *See*—
Kaplan, Yale, and Ross. Re. 24,251.
Waldschmidt, Henry. Electrician's fish tape reel. Re. 24,250, 12–4–56, Cl. 254—134.3.

# LIST OF PLANT PATENTEES

Conard-Pyle Co., The: *See*—
De Ruiter, Gerrit. 1,533.
De Ruiter, Gerrit, to The Conard-Pyle Co. Rose plant. 1,533, 12–4–56, Cl. 47—61.
Mahan, Fred A. Pecan tree and nut. 1,532, 12–4–56, Cl. 47—62.

# LIST OF DESIGN PATENTEES

Associated Spring Corp.: *See*—
Johnson, Ralph O. 179,349.
Bayer, Anna Y., to The Stroude Adler Co. Girdle. 179,336, 12–4–56, Cl. D20—2.
Brown, Thornton H., to Verplex Co. Garden lamp. 179,337, 12–4–56, Cl. D48—31.
Clarke, John G., to Owens-Illinois Glass Co. Ash tray. 179,338, 12–4–56, Cl. D85—2.
Clark, Philip B., and D. W. Harling, to McGraw Electric Co. Luminaire. 179,339, 12–4–56, Cl. D48—31.
Colson, U. O., Co.: *See*—
Woofter, Cecil B. 179,365.
Coro, Inc.: *See*—
Katz, Adolph. 179,351–179,355.
Delpidio, Dominic J. Clock. 179,340, 12–4–56, Cl. D42—7.
De Weese, Robert G., to Sharon Optical Co., Inc. Spectacle case. 179,341, 12–4–56, Cl. D57—1.
Flight, Lee, to M and M Corp. Telephone tray. 179,342, 12–4–56, Cl. D26—14.
Gemex Corp., The: *See*—
Sand, John F. 179,358.
Golding Bros. Co., Inc.: *See*—
Tillett, Leslie. 179,361.
Tillett, Leslie. 179,362.
Gombar, Andrew J., to The Whitney Blake Co. Electric cord plug. 179,343, 12–4–56, Cl. D26—1.
Greenstein, Benjamin, and C. Molk. Cover for a box. 179,344, 12–4–56, Cl. D52—11.
Harling, Donald W.: *See*—
Clark, Philip B., and Harling. 179,339.
Henry, George, Co.: *See*—
Henry, Larry S. and G. F. 179,345.
Henry, George F.: *See*—
Henry, Larry S. and G. F. 179,345.
Henry, Larry S. and G. F., to George Henry Co. Outdoor stove. 179,345, 12–4–56, Cl. D61—10.
Holland, Glen. Knob rose. 179,346, 12–4–56, Cl. D50—6.
Jenkins, G. C., Co.: *See*—
Jenkins, Grover C. 179,347.
Jenkins, Grover C., to G. C. Jenkins Co. Xylophone. 179,347, 12–4–56, Cl. D56—1.
Johnson, Clarence L., to Lockheed Aircraft Corp. Airplane. 179,348, 12–4–56, Cl. D71—1.
Johnson, Ralph O., to Associated Spring Corp. Christmas ornament. 179,349, 12–4–56, Cl. D29—1.
Joyce, Pale, to Joyce, Inc. Shoe or similar article. 179,350, 12–4–56, Cl. D7—7.
Joyce, Inc.: *See*—
Joyce, Pale. 179,350.
Katz, Adolph, to Coro, Inc. Brooch or the like. 179,351, 12–4–56, Cl. D45—19.
Katz, Adolph, to Coro, Inc. Link chain for a necklace or the like. 179,352, 12–4–56, Cl. D45—16.
Katz, Adolph, to Coro, Inc. Link chain for a necklace or the like. 179,353, 12–4–56, Cl. D45—16.
Katz, Adolph, to Coro, Inc. Link chain for a bracelet or the like. 179,354, 12–4–56, Cl. D45—4.
Katz, Adolph, to Coro, Inc. Link chain for a necklace or the like. 179,355, 12–4–56, Cl. D45—16.
Lockheed Aircraft Corp.: *See*—
Johnson, Clarence L. 179,348.
M and M Corp.: *See*—
Flight, Lee. 179,342.
McGraw Electric Co.: *See*—
Clark, Philip B., and Harling. 179,339.
Mihalyi, Richard F., to Sharon Optical Co., Inc. Spectacle case. 179,356, 12–4–56, Cl. D57—1.
Molk, Carl: *See*—
Greenstein, Benjamin, and Molk. 179,344.
Owens-Illinois Glass Co.: *See*—
Clarke, John G. 179,338.
Price, Harold. Fender flap for automobiles. 179,357, 12–4–56, Cl. D14—6.
Sand, John F., to The Gemex Corp. Expansible wristwatch bracelet. 179,358, 12–4–56, Cl. D48—4.
Schwarz, John. Plastic cigarette box. 179,359, 12–4–56, Cl. D85—2.
Sharon Optical Co., Inc.: *See*—
De Weese, Robert G. 179,341.
Mihalyi, Richard F. 179,356.
Small, James W. Combined display stand and picture projector. 179,360, 12–4–56, Cl. D60—9.
Stroude Adler Co., The: *See*—
Bayer, Anna Y. 179,336.
Tillett, Leslie, to Golding Bros. Co., Inc. Textile. 179,361, 12–4–56, Cl. D92—1.
Tillett, Leslie, to Golding Bros. Co., Inc. Textile. 179,362, 12–4–56, Cl. D92—1.
Tyree, Booker T. Combined cigarette holder and filter. 179,363, 12–4–56, Cl. D85—8.
Verplex Co.: *See*—
Brown, Thornton H. 179,337.
Whitney Blake Co., The: *See*—
Gombar, Andrew J. 179,343.
Wilson, Forest. Support for furniture. 179,364, 12–4–56, Cl. D33—1.
Woofter, Cecil B., to U. O. Colson Co. Telephone dialer or the like. 179,365, 12–4–56, Cl. D26—14.

Baker, Stephen C. Ignition element. 2,772,141, 12–4–56.
Binding, Kenneth W., to L. M. Beckwith. Automobile top

# LIST OF PATENTEES

Grundig, Henry. 2,772,805.
Hamner, Glen P. 2,773,106.
Jones, Clifton H., and Foust. 2,772,664.
Leary, Robert F. 2,773,061.
Ludi, William C., and Loeser. 2,772,783.
Meyer, Herbert W. H., and Wadley. 2,773,005.
Tausch, Gilbert H. 2,772,738.
Waddell, Mathis T. 2,773,019.
Yoder, Richard J. 2,773,015.

Ethyl Corp.: *See*—
Calingaert, George. 2,773,103.
Carley, David R., and Foster. 2,773,092.
Clarke, John T., and Cragg. 2,773,102.
Cohen, Lester S., Giraitis, and Zietz. 2,773,052.
Dunn, James H., and Weimer. 2,773,046.
Kolka, Alfred J. 2,773,105.
Ligett, Waldo B. 2,773,104.

Evans, Seth, to Hughes Tool Co. Threaded oil well drill stem connection with the threads having included crest angle of 90 degrees. 2,772,899, 12–4–56, Cl. 285—333.

Evans, William R.: *See*—
Neijstrom, Kenneth L., Peterson, and Evans. 2,772,715.

Fairbanks, Morse & Co.: *See*—
Armstrong, Werner E. 2,772,669.
Budsien, Hugo F. 2,773 955.
Budsien, Hugo F. 2,773,207.

Fairchild Camera and Instrument Corp.: *See*—
Boyajean, John A. 2,773,163.
Doyle, Irving W. 2,772,479.
Hotine, William. 2,772,598.

Farbenfabriken Bayer Aktiengesellschaft: *See*—
Schmidt, Fritz, and Bayer. 2,773,083.

Farnam, Roy A. Coupler for crank shaft grinder. 2,772,527, 12–4–56, Cl. 51—237.

Farnier, Andre. Device for obtaining liquid tightness of an enclosed space. 2,772,566, 12–4–56, Cl. 73—229.

Fast, Theodore M.: *See*—
Jacobs, Henry S., and Fast, 2,773,204.

Faull, John T.: *See*—
Bailey, Roy W., Faull, and Gill. 2,772,426.

Fauser, Giacomo, to Montecatini, societa generale per l'Industria Mineraria e Chimica. Process for the production of hydrogen and carbon monoxide from liquid fuels (heavy mineral oils). 2,772,955, 12–4–56, Cl. 48—215.

Faust, John A.: *See*—
Sahyun, Melville, Faust, and Julea. 2,773,096.

Federal Paper Board Co., Inc.: *See*—
Arneson, Edwin L. 2,772,610.
Arneson, Edwin L. 2,772,810.

Feick, Daniel E., W. G. Gibbs, and R. E. Howell, to United States Steel Corp. Sheet piling mechanisms. 2,772,612, 12–4–56, Cl. 93—93.

Feigley, David A., Jr., to Armstrong Cork Co. Method of making fibrous sheet material containing a synthetic rubber binder. 2,772,970, 12–4–56, Cl. 92—21.

Feller, Morris: *See*—
Field, Edmund, and Feller. 2,773,059.

Fernandez Andicio, Adolfo. Cylinder lock mechanism. 2,772,557, 12–4–56, Cl. 70—363.

Ferree, Joseph A.: *See*—
Kiefer, George C., and Ferree. 2,773,992.

Ferri, Antonio. Air inlet for supersonic airplane or missile. 2,772,620, 12–4–56, Cl. 98—1.

Ferro Stamping Co.: *See*—
Pickles, Joseph. 2,772,877.

Ferrucci, Tony F. Cardboard frames. 2,772,499, 12–4–56, Cl. 40—154.

Ferry, Chamberlain: *See*—
Roby, Sheldon S., and Ferry. 2,773,148.

Field, Edmund, and M. Feller, to Standard Oil Co. Ethylene polymerization with catalyst of group VA metal oxide and alkaline earth hydride. 2,773,063, 12–4–56, Cl. 260—94.9.

Filipowicz, Chester J.: *See*—
Lesparre, Jean N., and Filipowicz. 2,772,980.

Findley, Howard J., to Eaton Mfg. Co. Power transmitting apparatus. 2,773,205, 12–4–56, Cl. 310—96.

Firestone Tire & Rubber Co., The: *See*—
Albert, Harry E., and Kibler. 2,773,097.

Firth Sterling Inc.: *See*—
Williams, Everard M. 2,773,168.

Fischer, Richard A.: *See*—
Crawford, James V., Fischer, and Le May. 2,772,829.

Fishwood, Bollis W., and N. C. Williams, to Power Brake Equipment Co. Emergency air relay valve. 2,772,926, 12–4–56, Cl. 303—63.

Flexigrip, Inc.: *See*—
Post, Louis. 2,772,712.

Flint, Russell C., to LCN Closers, Inc. Connection for door-checks. 2,772,439, 12–4–56, Cl. 16—49.

Ford, John R., and E. W. Howery, to the United States of America as represented by the Secretary of the Air Force. Scanner wave guide. 2,773,256, 12–4–56, Cl. 343—768.

Formo, Jerome L., L. H. Le Gault, L. L. Bolstad, and A. D. Sinning, to Minneapolis-Honeywell Regulator Co. Epoxy resin composition containing para, para' diamino diphenylmethane. 2,773,048, 12–4–56, Cl. 260—37.

Forstrom, Edward E., and W. F. Allenby, to The Bryant Electric Co. Switch. 2,773,139, 12–4–56, Cl. 200—5.

Foster, Theodore D., to The Bell Machine Co. Automatic mortising and tenoning machine. 2,772,709, 12–4–56, Cl. 144—87.

Foster, Walter E.: *See*—
Carley, David R., and Foster. 2,773,092.

Foundry Equipment Ltd.: *See*—
Beech, Austin S. 2,772,453.

Foust, Charles W.: *See*—

Swenson Paul F., and Cooperrider. 2,772,834.

Weijlard, John, to Merck & Co., Inc. Preparation of glycoxyl steroids. 2,773,078, 12–4–56, Cl. 260—397.45.

Weimer, Paul E.: *See*—
Dunn, James H., and Weimer. 2,773,046.

Weintraub, Morris: *See*—
Gastright, Frank A. 2,772,890.

Werries, John W. Bolt holding dual socket wrench. 2,772,590, 12–4–56, Cl. 81—55.

West, De Witt H., and W. T. Phelps, to The International Nickel Co., Inc. Production of carbonyl iron powder. 2,772,956, 12–4–56, Cl. 75—0.5.

Westcott Russell G.: *See*—
Behnke, George W., and Westcott. 2,772,769.

Westinghouse Air Brake Co.: *See*—
Bush, Rankin J. 2,772,828.
Cotter, George L. 2,772,830.
Cotter, George L. 2,772,831.
Doolittle, Charles. 2,772,904.
McGowan, Kenneth J. J. 2,772,844.

Westinghouse Electric Corp.: *See*—
Baker, Robert M. 2,773,161.
Barrows, Robert C. 2,772,546.
Bright, Richard L. 2,773,132.
Brooks, Hamilton. 2,773,220.
Chauvin, David M. 2,773,222.
Colaiaco, August P. 2,773,211.
Dailey, Hampton J. 2,772,661.
Dunnet, Wallace J. 2,773,133.
Dunnet, Wallace J. 2,773,134.
Friedrich, Robert E. 2,773,155.
Gamberg, Edward R., and Ludwig. 2,772,989.
Guzzi, Walter B. 2,773,200.
Hall, James A. 2,773,212.
Hunt, William T., Jr. and Mathias. 2,773,229.
Immel, Ralph B. 2,773,145.
Immel, Ralph B., and Wibell. 2,773,144.
Large, William E. 2,773,234.
Lowry, Lewis R., Jr., and Richards. 2,773,156.
Malick, Franklin S. 2,773,235.
Marcks, Donald F. 2,773,233.

Westinghouse Electric Corp.: *See*—Continued.
Meier, Ward M., and Lide. 2,773,255.
Miller, Coleman J. 2,773,213.
Moore, Raymond W., Hull, and Stringer. 2,773,228.
Opel, Lawrence G., and Kimball. 2,773,203.
Opsahl, Alert M. 2,773,149.
Pennow, Willis A. 2,773,171.
Pennow, Willis A. 2,773,172.
Reichenecker, William J. 2,772,962.
Ricks, Herbert E., and Trigg. 2,773,025.
Saner, Louis E. 2,773,146.
Schneider, William, and Worthington. 2,772,696.
Singel, John B. 2,773,181.
Sinomo, John. 2,772,752.
Thomas, Donald E., Goldman, Gordon, and Johnson. 2,772,964.
Turner, Dennis R. 2,773,022.
Young, Douglass A. 2,773,240.
Zuhas, Florian J. 2,773,043.

Wettstein, Lee E. Load equalising trailer hitch. 2,772,893, 12–4–56, Cl. 280—406.

Wheldon, Robert J., A. E. Widdowson, and K. H. Wilkinson, to The M-O Valve Co. Ltd. Dispersed getter elements. 2,772,771, 12–4–56, Cl. 206—.4.

White Castle System, Inc.: *See*—
Tansley, Leslie R. 2,772,937.

White, David C. Special course torpedo. 2,772,647, 12–4–56, Cl. 114—23.

Whitehurst, Harry B., and W. H. Otto, to Owens-Corning Fiberglas Corp. Method of coating glass filaments with metal. 2,772,518, 12–4–56, Cl. 49—77.

Whitehurst, Harry B., and W. H. Otto, to Owens-Corning Fiberglas Corp. Glass composition and metal coated glass fiber. 2,772,987, 12–4–56, Cl. 117—126.

Whiteside, Arthur L.: *See*—
Rich, John P., and Whiteside. 2,772,864.

Whitney, William B., and W. N. Axe, to Phillips Petroleum Co. Lubricants. 2,773,038. 12–4–56, Cl. 252—48.8.

Whittaker, Wm. R., Co., Ltd.: *See*—
Campbell, Rodney B. 2,772,900.

Wibell, Martin: *See*—
Immel, Ralph B., and Wibell. 2,773,144.

Widdowson, Arthur E.: *See*—
Wheldon, Robert J., Widdowson, and Wilkinson. 2,772,771.

Wiedemann, Geo., Brewing Co., Inc., The: *See*—
Rickers, Frank O. 2,772,975.

Wieland, Hans, to Wieland Werke A. G. Continuous casting of metals. 2,772,459, 12–4–56, Cl. 22—200.1.

Wieland Werke A. G.: *See*—
Wieland, Hans. 2,772,459.

Wigton-Abbott Corp.: *See*—
Sowerwine, Elbert O., Jr. 2,772,947.

Wiland, Julius: *See*—
Masci, Joseph N., Ashton, and Wiland. 2,773,000.

Wilkinson, Kenneth H.: *See*—
Wheldon, Robert J., Widdowson, and Wilkinson. 2,772,771.

Williams, Cledwyn: *See*—
Lee, William G., and Williams. 2,772,920.

Williams, Ernest, to General Electric Co. Electric switch. 2,773,154. 12–4–56, Cl. 200—146.

Williams, Everard M., to Firth Sterling Inc. High-speed spark machining apparatus. 2,773,168, 12–4–56, Cl. 219—69.

Williams, J. H., & Co.: *See*—
Johnson, Walter J. 2,772,763.

Williams, Norman C.: *See*—
Fishwood, Rollin W., and Williams. 2,772,926.

Williams, Victor G., to Delamere & Williams Co., Ltd. Apparatus for forming, filling and sealing bags. 2,772,530, 12–4–56 Cl. 53—180.

Williams, Woodbury. Photocomposing apparatus and justifying apparatus. 2,772,613, 12–4–56, Cl. 95—4.5.

Williamson Adhesives Inc.: *See*—
Williamson, Donald G., Snover, and H. A. and R. H. Andresen. 2,772,653.
Williamson, Donald G., Snover, and H. A. and R. H. Andresen. 2,772,655.

Williamson, Donald G., M. W. Snover, and H. A. and R. H. Andresen, to Williamson Adhesives, Inc. Apparatus for coating strip material. 2,772,653, 12–4–56, Cl. 118—43.

Williamson, Donald G., M. W. Snover, and H. A. and R. H. Andresen, to Williamson Adhesives, Inc. Coating applicator for flexible strip material. 2,772,655, 12–4–56, Cl. 118—126.

Wills, Robert L. Method of welding rubber articles. 2,772,719, 12–4–56, Cl. 154—14.

Wilson, Charles T., Jr.: *See*—
Slier, Albert E., and Wilson. 2,772,572.

Wilson, Evelyn H., and M. Tishler, to Merck & Co., Inc. Chemical compounds and processes of preparing the same. 2,773,075 12–4–56, Cl. 260—397.45.

Wilson, Joseph D. C., II, to E. I. du Pont de Nemours and Co. Leather replacement compositions and process. 2,772,995, 12–4–56, Cl. 154—124.

Wilson, Thomas Y.: *See*—
Easton, Rufus, and Wilson. 2,772,455.

Wintle, Thomas D. G., to J. A. Crabtree & Co., Ltd. Electric switches and circuit breakers. 2,773,150, 12–4–56, Cl. 200—116.

Witherspoon, John E.: *See*—
Boden, Robert H., and Witherspoon. 2,772,567.

Witte, Roy, to Motorola, Inc. Converter mechanism for TV receiver. 2,773,177, 12–4–56, Cl. 250—16.

Woitach, Peter R., Jr.: *See*—
Herrick, Clifford E., Jr., Woitach, and Trojnar. 2,772,972.

Wolf, Joseph E.: *See*—
Snuggs, John F., Bock, and Wolf. 2,773,014.

Wolf, Joseph E., D. H. Wagner, and J. A. Bock, to Standard Oil Co. Hydrocarbon reforming system for high sulfur naphthas. 2,773,013, 12–4–56, Cl. 196—50.

Wolfe, Harry H., to The Buckeye Steel Castings Co. Railway coupler. 2,772,791, 12–4–56, Cl. 213—150.

Woodring, Albert P.: *See*—
Woodring, Emory R. and A. P. 2,772,587.

Woodring, Emory R. and A. P. Tool set for opening and closing chain links. 2,772,587, 12–4–56, Cl. 81—15.

Woodward, Alva W. Ladder attachment. 2,772,927, 12–4–56, Cl. 304—31.5.

Woodworth, Lee R., to the United States of America as represented by the Secretary of the Navy. Compressor discs. 2,772,853, 12–4–56, Cl. 253—39.

Worthington, Aubrey W.: *See*—
Schneider, William, and Worthington. 2,772,696.

Worthington Corp.: *See*—
Sebald, Joseph F. 2,773,029.

Woydatt, Lasek, and R. Chwialkowski. Reusable bottle stopper with severable skirt portion. 2,772,802, 12–4–56, Cl. 215—41.

Wright, Walter W., and G. P. Robinson, Jr. Duffer comb mechanism. 2,772,446, 12–4–56, Cl. 19—106.

Wünsch, Guido, and H. Ziegler, to Askania-Werke A. G. Precision galvanometer. 2,772,687, 12–4–56, Cl. 137—83.

Wüsteney, Herbert, J. Bauder, and R. Stabenau, to Siemens & Halske Aktiengesellschaft. Device for advancing tape records in telegraph apparatus. 2,772,678, 12–4–56, Cl. 271—2.4.

Wyckoff, Ralph D.: *See*—
Martin, B. G., and Wyckoff. 2,773,236.

Yamamoto, Nobuki: *See*—
Miura, Noboru, and Oketani. 2,772,580.

Yates, De Witt E., to W. S. Darley & Co. Centrifugal pump. 2,772,636, 12–4–56, Cl. 103—103.

Yoder, Richard J., to Esso Research and Engineering Co. Fluid hydroforming process. 2,773,015, 12–4–56, Cl. 196—50.

Young, Douglass A., to Westinghouse Electric Corp. Moving-coil electrical instruments. 2,773,240, 12–4–56, Cl. 324—150.

Yuba Mfg. Co.: *See*—
Sharp, Bayard. 2,772,577.

Zahlan, Antoine B.: *See*—
Linnell, Robert H., and Zahlan. 2,773,066.

Zahnradfabrik Friedrichshafen Aktiengesellschaft: *See*—
Maier, Albert, Schwab, and Kiechle. 2,772,581.

Zenczak, Piotr: *See*—
Grondal, Bror L., and Zenczak. 2,772,968.

Zerante, James A., and N. E. Bergdall. Fishing float. 2,772,504, 12–4–56, Cl. 43—17.

Ziegler, Horst: *See*—
Wünsch, Guido, and Ziegler. 2,772,687.

Zielinski, Edward A., ¼ to J. S. Kishel. Harmonica apparatus. 2,772,593, 12–4–56, Cl. 84—1.04.

Zietz, Joseph R., Jr.: *See*—
Cohen, Lester S., Giraitis, and Zietz. 2,773,052.

Zody, Forrest F., J. E. Key, Jr., and W. N. Taylor, Jr., to Junior Achievement, Inc. Golf cart seat. 2,772,720, 12–4–56, Cl. 155—5.

Zoxulin, Igor V., G. J. Okulitch, G. M. Volkoff, V. J. Okulitch, and A. S. J. Eliett, to Tormag Transmissions Ltd. Magnetic positive drive couplings. 2,773,206, 12–4–56, Cl. 310—100.

Zukas, Florian J., to Westinghouse Electric Corp. Resinous compositions comprising thermosetting epoxide resins and thermoplastic polyvinyl resins and benzoin-to-amine reaction products. 2,773,043, 12–4–56, Cl. 260—3.3.

Zupi, Anthony V. Internal combustion engine. 2,772,666, 12–4–56, Cl. 123—74.

Zwanenburg, Gooitsen: *See*—
Blok, Lourens, Starre, Zwanenburg, and de Kuiter. 2,773,192.

# CLASSIFICATION OF PATENTS

## ISSUED DECEMBER 4, 1956

NOTE.—First number—class, second number—subclass, third number—patent number

1— 44.4: 2,772,415
102: 2,772,416
2— 37: 2,772,417
42: 2,772,418
224: 2,772,419
4— 11: 2,772,420
178: 2,772,421
261: 2,772,422

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington 25, D. C., to whom all subscriptions should be made payable and all communications addressed; subscription price, $10.00 per annum, foreign mailing $2.60 additional; single copies, 20 cents each.

SN 5,075. American Synthetic Rubber Corporation, Louisville, Ky. Filed Mar. 23, 1956.

SN 10,239. Kleinwanzlebener Saatzucht vorm. Rabbethge & Giesecke Aktiengesellschaft, Einbeck, Hannover, Germany.

# MARKS PUBLISHED FOR OPPOSITION

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Notice of opposition under section 13 may be filed within thirty days of this publication. See Rules 20.1 to 20.5.

As provided by section 31 of said act, a fee of twenty-five dollars must accompany each notice of opposition.

## CLASS 1

## RAW OR PARTLY PREPARED MATERIALS

SN 690,746. Lee Patten Seed Company, Jersey City, N. J. Filed July 5, 1955.

Long Islander

For Lawn and Seed Mixture.
First use May 11, 1955.
Subj. to Intf. with SN 691 and SN 2,028.

SN 696,791. Flex-O-Glass, Inc., d. b. a. Warp Brothers, Chicago, Ill. Filed Oct. 20, 1955.

**POLYWRAP**

For Thin Plastic Sheets.
First use January 1955.

SN 699,072. Halvorson Trees, Inc., Duluth, Minn. Filed Nov. 29, 1955.

For Christmas Trees.
First use Nov. 12, 1955.

SN 657. Canadian International Paper Company, Montreal, Quebec, Canada. Filed Jan. 13, 1956.

**BRIGHTCELL**

Priority claimed under Sec. 44(d) on Canadian application filed Dec. 14, 1955; Reg. No. 104,226, dated Aug. 24, 1956.
For Cellulose Pulp for Use in the Production of Viscose.

SN 691. Pedigreed Seed Co., Jersey City, N. J. Filed Jan. 13, 1956. Sec. 2(f).

Without waiving its common law rights, applicant disclaims the map of Long Island and the words "Grass Seed Mixture," apart from the mark as shown.
For Lawn Grass Seed.
First use in 1940.
Subj. to Intf. with SN 2,028 and SN 690,746.

SN 2,028. Garfield Williamson, Inc., Jersey City, N. J. Filed Feb. 3, 1956.

**LONG ISLAND**

For Grass Seed.
First use April 1949.
Subj. to Intf. with SN 691 and SN 690,746.

SN 3,276. Charter Seed Company, Twin Falls, Idaho. Filed Feb. 24, 1956.

The drawing is lined for blue, red, and yellow.
For Vegetable Seeds.
First use Jan. 11, 1956.

SN 5,053. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Mar. 22, 1956.

The drawing is lined for red. Owner of Reg. Nos. 116,944, 581,289, and others.
For Coal.
First use Dec. 13, 1955.

SN 5,056. Proban Limited, London, England. Filed Mar. 22, 1956.

**PROBAN**

Owner of British Reg. No. 745,070, dated Aug. 9, 1955.
For Textile Fibres.

SN 5,075. American Synthetic Rubber Corporation, Louisville, Ky. Filed Mar. 23, 1956.

For Polymers Such as Synthetic Rubber.
First use May 14, 1955.

SN 8,648. Henry Field Seed & Nursery Company, Shenandoah, Iowa. Filed May 21, 1956.

**HY-X**

For Tomato Seeds and Plants.
First use Apr. 10, 1956.

SN 9,453. The Fair, Chicago, Ill. Filed June 1, 1956.

**FAIRVIEW**

For Grass Seed.
First use December 1930.

SN 9,566. Mitchell Farms, Windfall, Ind. Filed June 4, 1956.

The drawing is lined for red and yellow, but applicant does not wish to be bound by said colors. Owner of Reg. Nos. 391,481, 527,090, and 540,010.
For Seed Corn.
First use Feb. 21, 1956.

SN 9,919. Interplastics Corporation, New York, N. Y. Filed June 11, 1956.

For Raw Materials for the Plastics Industry—Namely, Synthetic Resin Material in the Form of Powder, Pellets, Flakes, Granules, Sheets, Rods, Bars and Tubes.
First use Feb. 6, 1956.

SN 10,239. Kleinwanzlebener Saatzucht vorm. Rabbethge & Giesecke Aktiengesellschaft, Einbeck, Hannover, Germany. Filed June 14, 1956.

**TRIBETA**

Owner of German Reg. No. 607,002, dated May 8, 1951.
For Sugar Beets, Sugar-Beet Seed, Fodder Beets, and Fodder-Beet Seed.

SN 11,131. Basic Ceramics, Inc., Cleveland, Ohio. Filed June 28, 1956.

**CERAMAKOTE**

For Materials Used in Forming Shell Molds for Precision Metal Castings.
First use Sept. 9, 1952.

SN 11,268. Loren Products Corporation, New York, N. Y. Filed June 29, 1956.

**SPRAY-BOND**

For Batting Made of Natural Fibres, of Synthetic Fibres, and of Combinations Thereof.
First use Nov. 15, 1955.

SN 12,246. American Artists' Color Works, Inc., Hazleton, Pa. Filed July 17, 1956.

**MAGICLAY**

For Clay Modeling Sets for Children and Adults.
First use July 10, 1956.

SN 12,806. The R. T. French Company, Rochester, N. Y. Filed July 25, 1956. Sec. 2(f).

**FRENCH'S**

Owner of Reg. No. 519,858.
For Bird and Pet Supplies—Namely, Bird and Aquarium Gravel, Cuttlebone, Nesting Hair, and Catnip Mice.
First use May 1922 on cuttlebone.

SN 13,139. Celanese Corporation of America, New York, N. Y. Filed July 31, 1956.

**CELACLOUD**

For Fibrous Filling Material for Use in Upholstery, Pillows, Mattresses, and the Like.
First use July 18, 1956.

## CLASS 4

## ABRASIVES AND POLISHING MATERIALS

SN 294. S. M. Arnold, Inc., St. Louis, Mo. Filed Jan. 9, 1956.

**SPUN GOLD**

For Polisher Discs and Bonnets, Wax Applicator Pads, and Mitts for Cleaning and Polishing.
First use on or before Apr. 9, 1954.

SN 6,438. Leavitt Machine Company, Orange, Mass. Filed Apr. 16, 1956.

**STEL O DEX**

For Abrasive Facing Members for a Grinding Machine.
First use Mar. 26, 1954.

## CLASS 5

### ADHESIVES

SN 7,235. Branded Products Corp., Hackensack, N. J. Filed Apr. 27, 1956.

**SO-E-Z**

For Liquid Adhesive Applied to Fabrics To Be Mended, the Fabrics To Which the Adhesive Has Been Applied Being Then Pressed Together.
First use Mar. 2, 1956.

## CLASS 6

### CHEMICALS AND CHEMICAL COMPOSITIONS

SN 680,825. James Robert Tully, d. b. a. Wood Preservatives Products, Seattle, Wash. Filed Jan. 31, 1955.

**Penwa-Stik**

For Chemical Wood Preservatives in the Form of Rods for Insertion Into Holes in Wood.
First use May 5, 1954.

SN 691,449. Eastman Kodak Company, Rochester, N. Y. Filed July 18, 1955. Sec. 2(f).

**Eastman**

Owner of Reg. Nos. 67,012, 513,160, and others.
For Polyethylene Waxes, and Waxes Made From Polyethylene.
First use May 19, 1955.

SN 693,565. Pennsylvania Refining Company, d. b. a. Penreco, Butler, Pa. Filed Aug. 23, 1955.

**SUKROIL**

No claim is made to the word "Oil" apart from the mark as shown.
For Self Emulsifying, Highly Refined Petroleum Oil Used To Eliminate and Inhibit the Growth of Secondary Leaves on Tobacco Plants Commonly Referred to as "Suckers."
First use June 27, 1955.

SN 696,958. Diamond Black Leaf Company, Cleveland, Ohio. Filed Oct. 24, 1955.

**NICO-FUME**

Owner of Reg. No. 49,622.
For Insecticidal Compound for Fumigating Greenhouses.
First use June 8, 1904.

SN 696,977. Halben Chemical Co. Inc., New York, N. Y. Filed Oct. 24, 1955.

**CHLOR-O-GAS**

For Insecticides and Mothicides—Namely, Crystals for Killing and Preventing Moths and Compositions for Killing Larvae and Eggs Consisting of Paradichlorobenzene.
First use January 1955.

SN 697,237. Nu-Vita Products Company, Pittsburgh, Pa. Filed Oct. 27, 1955.

**MICROJET**

Applicant disclaims the word "Sanitation."
For Household Germicide and Disinfectant.
First use December 1952.

SN 1,796. Lanolized, Incorporated, New York, N. Y. Filed Jan. 31, 1956.

**Lano-septic**

For Finishes for Textile Fabrics or Natural or Synthetic Fibers, and for Paper and Paper Products.
First use Nov. 28, 1955.

SN 3,768. Perdeck Solder Products Limited, Waltham Abbey, Essex, England. Filed Mar. 2, 1956.

**EPATAM 3311**

The numerals "3311" are disclaimed apart from the mark as shown. Owner of British Reg. No. 707,391, dated May 23, 1952.
For Soldering Preparations.

SN 4,657. Monsanto Chemical Company, St. Louis, Mo. Filed Mar. 15, 1956.

The drawing is lined for red. Owner of Reg. Nos. 333,369, 500,123, and others.
For Antifreeze.
First use Oct. 1, 1945.

SN 6,990. Crosby Chemicals, Inc., De Ridder, La. Filed Apr. 24, 1956.

**CROFATOL**

For Fatty Acids.
First use on or about Aug. 9, 1955.

SN 7,031. Metal and Thermit Corporation, Woodbridge, N. J. Filed Apr. 24, 1956.

**TBTO**

For Organic Chemicals Containing Tin.
First use on or about Apr. 6, 1956.

SN 7,254. Edwin R. Joseph, d. b. a. E. R. Joseph Co., Trooper, Norristown, Pa. Filed Apr. 27, 1956.

**ERJO**

For Brazing Flux.
First use Apr. 1, 1946.

SN 7,337. E. I. du Pont de Nemours and Company, Wilmington, Del. Filed Apr. 30, 1956. Sec. 2(f).

**DU PONT**

Owner of Reg. Nos. 374,883, 606,570, and others.
For Anhydrous Ammonia, Cyclohexanol, Cyclohexanone, Diglycolic Acid, Dimethyl Sulfate, Formamide, Hydroxyacetic Acid, Fatty Alcohols, Methacrylate Monomers, Methyl Formate, and Urea.
First use Sept. 6, 1949.

SN 7,767. Constructional Chemicals, Inc., Austin, Tex. Filed May 7, 1956.

**SEPTAMENE**

For Liquid Additive To Control the Setting and Quality of Concrete Mix.
First use March 1954.

SN 7,970. The Dow Chemical Company, Midland, Mich. Filed May 9, 1956.

**SEPARAN**

For Water-Soluble Organic Polymer Sold as a Flocculating Agent.
First use Sept. 24, 1954.

SN 8,694. R-Columbia Products Co., Highwood, Ill. Filed May 21, 1956.

**FONO-MAGIC**

For Liquid Compound for Application to Phonograph Drives To Eliminate Slippage.
First use May 10, 1956.

## CLASS 10

### FERTILIZERS

SN 6,027. Roderick I. McLellan, d. b. a. Rod McLellan Co., South San Francisco, Calif. Filed Apr. 9, 1956.

**Wonderbark**

For Plant Matrix Consisting of Fir Bark To Which Nutrients for Orchids and Other Plants Have Been Added.
First use Oct. 15, 1955.

SN 12,389. South Memphis Stockyard Company, Memphis, Tenn. Filed July 18, 1956.

**GRO! GRO!!!**

For Plant Food.
First use May 22, 1956.

## CLASS 11

### INKS AND INKING MATERIALS

SN 9,601. Speedry Products, Inc., Richmond Hill, N. Y. Filed June 4, 1956.

**MAGIC MARKER**

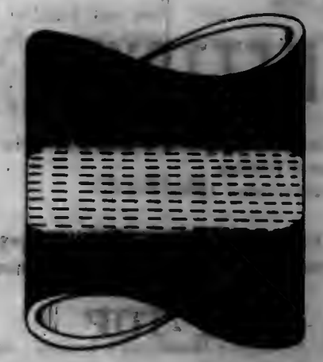
Applicant disclaims the term "Marker" apart from the mark as a whole.
For Felt Nib Marking Pens Comprising Small Containers for Such Ink, Equipped With Caps and Having Felt Nibs at Their Ends for Marking.
First use on or about Sept. 1, 1952.

SN 11,798. Scripto, Inc., Atlanta, Ga. Filed July 9, 1956.

**SATELLITE**

For Ink.
First use June 27, 1956.

SN 11,800. Scripto, Inc., Atlanta, Ga. Filed July 9, 1956.



**SPACE MASTER**

For Ink.
First use June 27, 1956.

## CLASS 12

### CONSTRUCTION MATERIALS

SN 687,401. Orangeburg Manufacturing Co., Inc., Orangeburg, N. Y. Filed May 12, 1955.

The mark consists of a grey circumferential band which is sprayed directly onto or otherwise applied directly to the goods. Applicant disclaims the representation of the goods.
For Conduit, Ducts, and Pipes Made of Fibre Composition.
First use Feb. 1, 1955.

SN 691,653. American-Marietta Company, Chicago, Ill. Filed July 21, 1955.

**AMSEAL**

For End Rings for Pipe Formed of Concrete and the Like.
First use on or about July 1, 1954.

SN 696,926. The Adapane Company, Winnipeg, Manitoba, Canada. Filed Oct. 24, 1955.

ADAPANE

For Glazing and Weather Strips for Windows and Doors.
First use October 1954.

SN 700,295. Basic Refractories Incorporated, Cleveland, Ohio, now by change of name Basic, Incorporated. Filed Dec. 20, 1955. Sec. 2(f).

"Spreads like warm butter"

For Hydrated Lime for Building and Construction Purposes.
First use May 1, 1920.

SN 2,374. Orchard Brothers Incorporated, Rutherford, N. J. Filed Feb. 9, 1956.

ERECTANGLE

For Metal Structural Members—Namely, Channels, Angles, Beams, and the Like.
First use Jan. 26, 1956.

SN 2,933. Tarr and Wonson, Limited, Gloucester, Mass. Filed Feb. 17, 1956.

SEA JACKET

For Bedding Compound, Non-Skid Compound, Wood Filler, and Seam Compound.
First use September 1954.

SN 3,377. Fair Haven Slate Company, Inc., Fair Haven, Vt. Filed Feb. 27, 1956.

METTOWEE

For Slate Stone Flooring, Slate Stone Hearth Flooring, and Slate Stone Mantel Facing.
First use about October 1950.

SN 5,662. Northwest Ga. Enterprises, Inc., Rome, Ga. Filed Apr. 2, 1956.

TIP-TOP

For Prefabricated Boat Houses.
First use Mar. 5, 1956.

SN 6,249. Globe Roofing Products Co., Inc., Whiting, Ind. Filed Apr. 12, 1956.

EVERGLAZE

For Mineral Surfaced Asphalt Shingles.
First use Sept. 5, 1945.

SN 7,951. Sears, Roebuck and Co., Chicago, Ill. Filed May 8, 1956.

VERTI-STRIPE

For Metal Awnings.
First use on or about June 1, 1953.

CLASS 13

HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

SN 696,832. Safe-T Flow Corporation, Barre, Mass. Filed Oct. 20, 1955.

SAFE-T-FLOW

For Float-Type Automatic Shut-Off Devices for Overflow of Fuel Oil Burners and the Like.
First use Nov. 1, 1954.

SN 2,936. Alfonso J. Diletto, d. b. a. Enterprise Ornamental Statuary Products, Meadowbrook, Pa. Filed Feb. 20, 1956.

CONCEAL-A-VENT

For Ornamental Figures for Concealing Roof Plumbing Vent Pipes.
First use Oct. 10, 1955.

SN 7,752. Buckeye Iron & Brass Works, Dayton, Ohio. Filed May 7, 1956. Sec. 2(f).

PRESTITE

Owner of Reg. No. 388,452.
For Fill Caps for Closing Liquid Conduit Openings.
First use Mar. 22, 1951.

SN 8,440. Russell Sabor, Minneapolis, Minn. Filed May 16, 1956.

SPRINK-O-MATIC

For Automatic Valves for Dispensing and Distributing Liquids in an Irrigation Sprinkling System From a Main Source to the Individual Channels Through Mechanical Means.
First use Jan. 4, 1955.

SN 11,273. Market Forge Company, Everett, Mass. Filed June 29, 1956. Sec. 2(f).

STEAM-IT

Owner of Reg. No. 545,771.
For Pressure Cookers.
First use Nov. 11, 1949.

SN 11,484. Melvin J. Houck, d. b. a. Mel Houck Products, Tulare, Calif. Filed July 3, 1956.

First use October 1951.
For Drawer Slides.

SN 11,646. Snell-Jones Mfg. Co., Inc., Brockton, Mass. Filed July 3, 1956.

PRESTO

For Wire and Cut Tacks, Nails, Staples, Brads, and Double Pointers.
First use Jan. 1, 1940.

CLASS 15

OILS AND GREASES

SN 700,936. Paragon Oil Company, Incorporated, Long Island City, N. Y. Filed Dec. 27, 1955.

paragon
None Better

"None Better," "Gasoline," and "Motor Oils" are disclaimed apart from the mark as shown. Owner of Reg. No. 554,167.
For Gasoline and Petroleum Lubricating Oils.
First use Apr. 1, 1925.

SN 14,299. Union Carbide and Carbon Corporation, New York, N. Y. Filed Aug. 20, 1956.

UNION CARBIDE

For Synthetic Lubricant.
First use June 20, 1956.

SN 14,602. Victrylite Candle Company, Oshkosh, Wis. Filed Aug. 24, 1956.

HERITAGE

For Candles.
First use July 1, 1956.

CLASS 16

PROTECTIVE AND DECORATIVE COATINGS

SN 686,522. American-Marietta Company, Chicago, Ill. Filed Apr. 29, 1955.

Jell-O MAGIC

The drawing is lined for red but no claim is made to color. Applicant claims exclusive right to the use of the word "Jelled" as a part of its mark, but not otherwise. Owner of Reg. No. 617,380.
For Thixotropic Gel Paint.
First use on or about Mar. 7, 1955.

SN 8,430. The O'Brien Corporation, South Bend, Ind. Filed May 16, 1956.

BONANZA

For Wall Paint.
First use Feb. 1, 1955.

SN 8,862. The Marsol Corporation, Bay City, Tex. Filed May 23, 1956.

CRETO

For Waterproof and Preservative Coating Compound.
First use Jan. 13, 1956.

CLASS 17

TOBACCO PRODUCTS

SN 7,533. Riggio Tobacco Corporation, Brightwaters, N. Y. Filed May 2, 1956.

REGENT
High Quality
CIGARETTES

The drawing is lined for red. The words "High Quality Cigarettes" are disclaimed apart from the mark. Owner of Reg. No. 369,300.
For Cigarettes.
First use Jan. 9, 1956.

CLASS 18

MEDICINES AND PHARMACEUTICAL PREPARATIONS

SN 696,117. The Central Pharmacal Company, Seymour, Ind. Filed Oct. 10, 1955.

PALATABS

For Sweetened Flavored Medicinal Tablets Especially for Children, for the Relief of Headaches, Neuralgia, Minor Aches and Pains, and Discomforts Due to Colds.
First use 1932.

SN 698,613. E. W. Heun Co., St. Louis, Mo. Filed Nov. 21, 1955.

GASTROSEAL

For Enteric Coated Pharmaceutical Tablets.
First use September 1952.

SN 78. Dr. L. D. Le Gear Medicine Company, St. Louis, Mo. Filed Jan. 3, 1956.

PIG SWIG

Owner of Reg. Nos. 291,444, 600,912, and others.
For Liquid Wormer for the Removal of Large Round Worms and Nodular Worms From Swine.
First use Nov. 10, 1955.

SN 238. Clover Chemical Company, Eightyfour, Pa. Filed Jan. 6, 1956.

CLOVER-FEEN

For Anthelmintic for Removing Internal Parasites From Livestock, Comprising Flavored Phenothiazine.
First use Oct. 15, 1955.

SN 478. Botan Pharmaceutical Company, Providence, R. I. Filed Jan. 11, 1956.

KIN

For Skin Ointment for the Protection of the Skin and Treatment of Skin Irritations.
First use Aug. 26, 1955.

SN 2,589. Sun-Gold Vitamin Supply Co., Seattle, Wash. Filed Feb. 13, 1956.

SUN-GOLD

For Vitamin and Mineral Food Supplement.
First use Dec. 29, 1955.

SN 3,028. Protein Feed Corp., Tennent, N. J. Filed Feb. 20, 1956.

PRO-VI-MIN

For Pharmaceutical in Concentrated Form Having as Essential Ingredients Thereof Selected Vitamins, Minerals, and Proteins, Used as a Feed Supplement for Animal Feeds.
First use May 1952.
Subj. to Intf. with Reg. No. 621,690.

SN 3,375. Eric, Kirk & Gary, Inc., Cincinnati, Ohio. Filed Feb. 27, 1956.

For Drugs and Medicines—Namely, Vitamins in Capsule, Tablet or Liquid Form; Cardio-Vascular Drugs in Capsule or Tablet Form.
First use Jan. 12, 1956.

SN 4,586. S. J. Tutag & Company, Detroit, Mich. Filed Mar. 14, 1956.

TRE-O-TABS

For Anorectic-Hormonal Preparation for Use in Obesity.
First use February 1945.

SN 4,587. S. J. Tutag & Company, Detroit, Mich. Filed Mar. 14, 1956.

TRE-O-CAPS

For Anorectic-Hormonal Preparation for Use in Obesity.
First use February 1953.

SN 4,980. Nysco Laboratories, Inc., Long Island City, N. Y. Filed Mar. 21, 1956.

PENTASERPINE

For Medicinal Relaxant and Sedative Preparation.
First use Mar. 1, 1956.

SN 6,270. Nordmark Pharmaceutical Laboratories, Inc., Irvington, N. J. Filed Apr. 12, 1956.

PANZYNORM

For Extract of the Hog Stomach Mucosa To Be Used as a Pharmaceutical Preparation for the Deficiency of Gastric Secretion.
First use Mar. 21, 1956.

SN 6,879. George S. Varner, d. b. a. Varner Mills, Rock Island, Ill. Filed Apr. 20, 1956.

VARO-VITA

For Cattle Feed Supplement Containing Vitamins and Sulphates.
First use Apr. 2, 1956.

SN 7,053. Harvey Wolfson, d. b. a. Columbia Medical Company, New York, N. Y. Filed Apr. 24, 1956.

SPEEDRIN

For Buffered Aspirin.
First use Feb. 3, 1956.

SN 7,456. Premo Pharmaceutical Laboratories, Inc., South Hackensack, N. J. Filed May 1, 1956.

VITA RESPITAL

Owner of Reg. No. 630,301.
For Therapeutic Composition for Malnourished and/or Mentally Disturbed Persons.
First use Oct. 15, 1955.

SN 8,477. George Wayne Edwards, d. b. a. Deaf Smith County Pharmaceutical Co., Hereford, Tex. Filed May 17, 1956.

FLUORAMIN

For Vitamin Preparation in Tablet Form.
First use Apr. 26, 1956.

SN 8,519. Xtrium Co., Chicago, Ill. Filed May 17, 1956.

RYTHROSITE

For Dietary Supplement in Treatment of Anemia.
First use Mar. 1, 1956.

SN 8,602. Abbott Laboratories, North Chicago, Ill. Filed May 21, 1956.

TERGEMIST

For Solution for Aerolisation for Relief of Bronchial Congestion.
First use Feb. 7, 1956.

SN 9,234. The Borden Company, New York, N. Y. Filed May 31, 1956.

D-Q

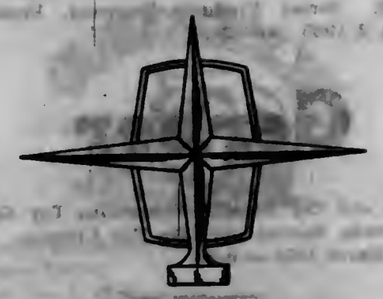
For Vitamin A and D Concentrate and for Vitamin-Mineral Mixture.
First use May 31, 1954.

SN 9,468. Hoffmann-La Roche Inc., Nutley, N. J. Filed June 1, 1956.

TASHAN

For Therapeutic Skin Cream.
First use Mar. 28, 1956.

SN 12,696. Ortho Pharmaceutical Corporation, Raritan, N. J. Filed Aug. 13, 1956.



RARICAL

Owner of Reg. No. 590,771.
For Dietary Supplements Containing Minerals.
First use Oct. 29, 1953.

CLASS 19

VEHICLES

SN 691,762. Ford Motor Company, Dearborn, Mich. Filed July 22, 1955.

The mark comprises an emblem having four right-angled points overlying a generally rectangular frame. Owner of Reg. No. 606,637.
For Motor Cars.
First use June 24, 1955.

SN 9,435. Boles-Aero, Inc., Burbank, Calif. Filed June 1, 1956.

ZENITH

For Trailer Coaches.
First use May 5, 1956.

SN 9,558. Loria-Cournand, Inc., Havre de Grace, Md. Filed June 4, 1956.

SKIMBOAT

For Motor Boats.
First use May 14, 1956.

SN 9,588. Stanley F. Raczynski, d. b. a. Nashua Manufacturing Co. of California, Tulare, Calif. Filed June 4, 1956.

NASHUA

For House Trailers.
First use May 1, 1949.

SN 9,859. Goodyear Aircraft Corporation, Akron, Ohio. Filed June 8, 1956.

INFLATOPLANE

For Airplanes.
First use Feb. 1, 1956.

CLASS 21

ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

SN 3,506. Zayon Corporation, Seattle, Wash. Filed Feb. 27, 1956.

For Electrical Glass Heating Assemblies.
First use Jan. 2, 1955.

SN 3,612. Julius Kupfer, Inc., New York, N. Y. Filed Feb. 29, 1956.

HOLLY-LITES

For Christmas Tree Lights.
First use May 1, 1952.

SN 3,701. Municipal Street Sign Co., Inc., Brooklyn, N. Y. Filed Mar. 1, 1956.

For Sound Producing Device Incorporating an Automatic Sound Recording and/or Reproducing System and/or Microphone for Instantaneous Sound Reproduction.
First use May 1955.

SN 5,511. Doyle Vacuum Cleaner Company, Grand Rapids, Mich. Filed Mar. 30, 1956. Sec. 2(f).

DOYLE

Owner of Reg. No. 536,491.
For Electrical Vacuum Cleaners and Attachments Therefor and Vacuum Cleaner Bags.
First use on or about Sept. 1, 1938.

SN 5,790. Radiant Products, Inc., Monroe, N. C. Filed Apr. 4, 1956.

KOZY KIDDY

For Heated Baby Play Pen Pad.
First use Nov. 25, 1955.

SN 7,251. Given Manufacturing Co., Los Angeles, Calif., now by change of name Waste King Corporation. Filed Apr. 27, 1956.

**WASTE KING**

Owner of Reg. Nos. 444,294 and 570,172.
For Electrically Operated Automatic Dishwashers and Electric Machines for Grinding Up Garbage.
First use in February 1947 on electric machines for grinding up garbage.

SN 7,258. Lodge Plugs Limited, Rugby, England. Filed Apr. 27, 1956.

**SINTOX**

Owner of British Reg. No. 687,996, dated Apr. 6, 1950; and U. S. Reg. No. 370,078.
For Electrical Insulating Material and Electrical Insulator Parts, All Made Principally of Alumina.

SN 8,885. Sprague Electric Company, North Adams, Mass. Filed May 23, 1956.

**FABMIKA**

For Electrical Capacitors.
First use May 4, 1956.

SN 9,118. Control Products, Inc., Harrison, N. J. Filed May 28, 1956.

**FLAT-STAT**

For Electric Switch.
First use May 14, 1956.

SN 9,267. Hermes Sonic Company, New York, N. Y. Filed May 29, 1956.

Hermes sonic

For Ultrasonic Watch Cleaning Machine.
First use May 2, 1956.

SN 9,772. Comet Lamp Company, New York, N. Y. Filed June 7, 1956.

*TRAC-O-LITE*

For Interchangeable Lighting Fixture.
First use January 1956.

SN 10,084. Duro-Test Corporation, North Bergen, N. J. Filed June 12, 1956.

**SUPER-LUMEN**

For Incandescent and Fluorescent Lamps.
First use May 17, 1956.

SN 10,087. General Cable Corporation, New York, N. Y. Filed June 12, 1956.

**GENCATROL**

For Insulated Electrical Wires.
First use May 26, 1956.

SN 10,186. New York Merchandise Co., Inc., New York, N. Y. Filed June 13, 1956.

**FLIK-A-LITE**

For Electric Christmas Tree Lights and Decorations.
First use Feb. 1, 1956.

## CLASS 22

## GAMES, TOYS, AND SPORTING GOODS

SN 691,687. Gerber Products Company, Fremont, Mich. Filed July 21, 1955. Sec. 2(f) as to "Gerber."

**The Gerber Baby**

For Dolls and Toy Utensils—Namely, Toy Spoons, Dishes, Bottles, Brushes, Bubble Pipes and Like Toy Utensils, and Dolls' Clothing—Namely, Boots, Dresses, and Sleeping Garments.
First use Dec. 31, 1954; March 1936 as to "Gerber."

SN 692,325. Gerber Products Company, Fremont, Mich. Filed Aug. 2, 1955. Sec. 2(f).

**Gerber**

For Dolls and Toy Utensils Comprising Toy Nursing Bottles, Toy Bowls, Spoons and Like Toy Utensils.
First use March 1936 on dolls.

SN 694,008. Sifo Company, St. Paul, Minn. Filed Aug. 31, 1955.

*Fran-Tick the Train*

For Pull Train Toy.
First use Apr. 1, 1955.

SN 694,009. Sifo Company, St. Paul, Minn. Filed Aug. 31, 1955.

**ROCK-A-BYE TWIN BUILD-UP**

For Platform and Build Up Blocks.
First use Apr. 5, 1955.

SN 694,014. Sifo Company, St. Paul, Minn. Filed Aug. 31, 1955.

**KINDER-SCHOOL**

For Children's Bag and Container in Combination With Play Blocks or Toys.
First use Apr. 5, 1955.

SN 694,201. Consolidated Research and Development Corporation, Monrovia, Calif. Filed Sept. 6, 1955.

Aqua-Glide

Owner of Reg. No. 558,258.
For Water Skis.
First use Nov. 15, 1949.

SN 700,418. La Chemise Lacoste, Paris, France. Filed Dec. 19, 1955.

Owner of French Reg. No. 393,011, dated Mar. 30, 1949 (Paris); Natl. Inst. No. 448,089.
For Sports Equipment—Namely, for Tennis Racquets, Tennis Balls, Golf Clubs, and Golf Balls.

SN 4,339. Maxwell Manufacturing Company, Vancouver, Wash. Filed Mar. 12, 1956.

The drawing is lined for red.
For Fishing Tackle.
First use June 1, 1946.

SN 4,346. Monsanto Chemical Company, St. Louis, Mo. Filed Mar. 12, 1956.

**MONSANTO**

For Golf Balls and Golf Tees.
First use Feb. 15, 1939, on golf tees.

SN 4,439. Gerber Products Company, Fremont, Mich. Filed Mar. 13, 1956.

The representation of an infant's head is an artistic drawing of a picture of Ann Turner Cook taken when a child, consent of record.
For Toys—Namely, Blocks, Balls, Building Sets, Sand Pile Sets—Namely, Sand Sieves, Pails, Shovels and Molds, Bottles, Wagons and Wagon Sets, Sprinklers and Sprinkler Sets, Wheelbarrows and Wheelbarrow Sets.
First use August 1955.

SN 4,730. Cyril Edmond McDonald, Washington, D. C. Filed Mar. 16, 1956.

**CHAMPION**

For Medium for Scoring Amateur and Professional Boxing Matches (Prize Fights).
First use Mar. 1, 1956.

SN 4,883. E. L. Blair & Son, Williamsport, Pa. Filed Mar. 20, 1956.

**PER-F-ECT**

For Salmon Egg Hooks; Minnow Wires; Snelled Worm Gangs; Nylon Snelled Hooks; Leaders and Spinning Nylon Lines.
First use Jan. 10, 1948.

SN 9,493. Lewis Sargent, Kernville, Calif. Filed June 1, 1956.

For Fishing Lures.
First use Feb. 2, 1954.

## CLASS 23

## CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

SN 676,624. Geraetebau-Anstalt, Balsers, Balsers, Liechtenstein. Filed Nov. 15, 1954.

**BALZERS**

Owner of Liechtenstein Reg. No. 344, dated Oct. 22, 1953.
For Vacuum Machinery and Parts and Accessories Thereof for Use in Connection With Smelting, Melting, Casting, Annealing, Sintering, De-Gassing and Distillation of Metals and for Impregnation, Distillation, Drying and the Coating of Eye and Spectacle Glasses, Lenses and Other Optical Goods With Thin Films for Producing Reduced or Increased Absorption or Reflection.

SN 685,503. Kwikset Locks, Inc., Anaheim, Calif. Filed Apr. 14, 1955.

For Powdered Metal Parts, Such as Sprockets, Gears, Brush Holders.
First use Jan. 19, 1954.

SN 692,903. Daniel M. Cecharlo, West Hollywood, Calif. Filed Aug. 12, 1955.

STA-GREEN

For Hand Tool for Removing Pock Marks on Golf Courses.
First use during the month of November 1954.

SN 1,461. Nordischer Maschinenbau Rud. Baader, Lubeck, Germany. Filed Jan. 25, 1956.

## STRAIGHTLINE

Owner of German Reg. No. 675,447, dated May 4, 1955.
For Machines for Decapitating, Eviscerating, Boning, Cleaning and Filleting Fish Bodies and Drives for Such Machines.

SN 6,806. Horne-Wilson, Inc., Atlanta, Ga. Filed Apr. 20, 1956.

Readi-Flo

The drawing is lined for red, but no claim is made to color.
For Pumps and Water Systems.
First use Apr. 3, 1956.

SN 6,950. Noble Company, Oakland, Calif. Filed Apr. 23, 1956.

## BATCHMOBILE

For Cement and Aggregate Batching Plants.
First use Apr. 2, 1956.

SN 8,538. Taylor E. Decker, d. b. a. Decker Manufacturing Co., Rockford, Ill. Filed May 18, 1956.

## HYDRO-FLATER

For Tire Liquid Inflaters and Accessories Therefor.
First use Mar. 9, 1956.

SN 8,591. Triangle Package Machinery Company, Chicago, Ill. Filed May 18, 1956.

## ELEC-TRI-FLEX

For Automatic Bag Making, Filling, and Sealing Machines.
First use on or about Mar. 29, 1956.

SN 8,671. Frank C. Kopecky, d. b. a. Pewaukee Novelty Mfg. Co., Pewaukee, Wis. Filed May 21, 1956.

## CICLE BUSTER

For Device To Split Twin Water Ice Novelties.
First use Aug. 20, 1955.

SN 9,064. Underwood Corporation, New York, N. Y. Filed May 25, 1956.

## GOLDEN TOUCH

For Typewriters and Parts Thereof.
First use Apr. 9, 1956.

SN 9,408. Dr. Otto Stader, d. b. a. Ardmore Specialties, Ardmore, Pa. Filed May 31, 1956.

## "HooKouT"

For Fisherman's Pliers.
First use Mar. 25, 1956.

SN 9,417. Stevens Walden Inc., Worcester, Mass. Filed May 31, 1956.

SW

For Adjustable, Box, Open End, and Combination Wrenches and Special Wrenches, Screw-Drivers, Flaring Tools, Tubing Cutters, Valve Tools, and Piston Vices.
First use Jan. 3, 1956.

SN 9,440. Clinton Machine Company, Clinton, Mich. Filed June 1, 1956.

CLINTON

For Internal Combustion Engines, Outboard Motors, Chain Saws, and Parts Thereof.
First use at least as early as 1946 on internal combustion engines and parts thereof.

SN 9,507. The Waterbury Farrel Foundry & Machine Company, Waterbury, Conn. Filed June 1, 1956.

## HEADMASTER

For Machine Tools—Namely, Headers Employed in the Making of Bolts and Screws.
First use May 9, 1956.

SN 9,643. Joy Manufacturing Company, Pittsburgh, Pa. Filed June 5, 1956.

## COPPERHEAD

For Drill Bits.
First use Feb. 3, 1954.

SN 9,649. Kwikset Locks, Inc., Anaheim, Calif. Filed June 5, 1956.

K P M P

For Structural Parts—Namely, Rotating Bands and Cams.
First use Jan. 18, 1954.

SN 9,668. Regie Nationale des Usines Renault, Billancourt, Seine, France. Filed June 5, 1956.

## VENTOUX

Owner of French Reg. No. 450,425, dated Apr. 15, 1955 (Seine); Natl. Inst. No. 55,215.
For Motors for Motor Vehicles.
First use February 1956.

SN 9,831. Viber Company, Burbank, Calif. Filed June 7, 1956.

## UNIVIBER

Owner of Reg. Nos. 297,997 and 623,385.
For Machines for Vibrating, Placing, and Packing Wet Concrete in Forms and Molds.
First use on or about May 1, 1956.

SN 9,835. Worthington Corporation, Harrison, N. J. Filed June 7, 1956. Sec. 2(f).

## WORTHINGTON

For Pumps, Compressors, Blowers, Ejectors, Internal Combustion Engines, Comminutors, Condensing and Evaporating Apparatus, Accumulators, Oil Separators, Boiler Feedwater Apparatus, Machinery, Apparatus and Valve Elements for Raising, Forcing, Controlling and Regulating Flow of Liquids, Gases or Steam.
First use in the year 1845.

SN 9,865. The International Silver Company, Meriden, Conn. Filed June 8, 1956.

## MARK III

For Stainless Steel Flatware—Knives, Forks, and Spoons.
First use Apr. 26, 1956.

SN 9,876. John M. R. Lyeth, Jr., d. b. a. Lyeth Engineering Company, East Detroit, Mich. Filed June 8, 1956.

HI-TORK

For Vehicle Differential Assemblies.
First use Oct. 7, 1953.

SN 9,951. Joseph B. Cox, d. b. a. Omark Industries, Portland, Oreg. Filed June 11, 1956.

Omark

The shaded portions denote color contrast.
For Powder Actuated Tools, Drive Pins, Drill Anchors, and Tool Kits.
First use May 25, 1956.

SN 10,000. Midas, Inc., Chicago, Ill. Filed June 11, 1956.

MIDAS

Owner of Reg. No. 620,322.
For Mufflers for Internal Combustion Engines and Parts Thereof—Namely, Tail Pipes, Exhaust Pipes, and Muffler Clamps.
First use June 1955.

SN 10,082. A. B. Dick Company, Niles, Ill. Filed June 12, 1956.

Owner of Reg. Nos. 352,367, 547,242, and 599,022.
For Machines for Offset Duplication and Parts Thereof.
First use Oct. 13, 1955.

SN 16,002. Markwell Manufacturing Co. Inc., New York, N. Y. Filed Oct. 8, 1956.

## STAPLE-MASTER

The term "Staple" is hereby disclaimed apart from the mark as shown.
For Stapling Machines Used for Fastening Papers, Cardboard, Fabrics, Metal, Etc.; Together Also for Fastening Papers, Cardboard, Fabrics, Metal, Etc. on to Wood, Etc.
First use Aug. 26, 1936.

SN 16,003. Markwell Manufacturing Co. Inc., New York, N. Y. Filed Oct. 8, 1956.

## PUNCHMASTER

For Hand-Carried Punches Used for Punching Holes in Tickets, Papers, Cardboard, and Cloth Fabrics.
First use July 10, 1940.

SN 16,004. Markwell Manufacturing Co. Inc., New York, N. Y. Filed Oct. 8, 1956.

## ATOMIC

For Stapling Machines Used for Fastening Papers, Cardboard, Fabrics, and Metal Together, and Also for Fastening Papers, Cardboard, Fabrics, and Metal on to Wood.
First use Aug. 9, 1945.

SN 16,007. Thomas Collators Inc., New York, N. Y. Filed Oct. 9, 1956.

For Mechanical Fingers for Gathering Paper Sheets in Their Proper Sequence Termed Collators.
First use May 1947.

SN 16,311. Geo. J. Meyer Manufacturing Co., Cudahy, Wis. Filed Oct. 10, 1956. Sec. 2(f).

MEYER-DUMORE

For Bottle Washing Machines, Bottle Filling Machines, and Pasteurisers.
First use Jan. 1, 1919.

## CLASS 26

## MEASURING AND SCIENTIFIC APPLIANCES

SN 686,596. A. S. Aloe Company, St. Louis, Mo. Filed May 2, 1955.

DISPENSA-SLIDE

For Containers for Microscope Slides.
First use Apr. 20, 1955.

SN 1,439. Emil C. Hellwig, d. b. a. E. C. Hellwig, Burlington, Iowa. Filed Jan. 25, 1956.

For Guides for Aligning Pipe When Being Bent.
First use Sept. 12, 1955.

SN 4,955. Heia Manufacturing Corp., New York, N. Y. Filed Mar. 21, 1956.

CLIP-PER CASE

Applicant disclaims the word "Case" apart from the mark as shown.
For Eye Glass Cases.
First use Mar. 1, 1954.

SN 15,430. Perry Industries Incorporated, Brooklyn, N. Y. Filed Sept. 13, 1956.

ACCOFIL

For Filling Machine for Rapid and Accurate Premeasured Filling of Vials in Small Containers by Vacuum With Powder and Other Free Flowing Materials Other Than Liquids.
First use Apr. 26, 1948.

## CLASS 27

## HOROLOGICAL INSTRUMENTS

SN 686,453. Importadora de Relogios Sul-Americana S. A., Rio de Janeiro, Brazil. Filed Apr. 28, 1955.

Langton

Priority is claimed under Sec. 44(d) on Brazilian application filed Nov. 8, 1954; Reg. No. 187,978, dated Aug. 31, 1956.
For Watches and Clocks.

SN 8,709. Pierre Seitz, Les Breuets, Switzerland. Filed May 21, 1956.

Priority claimed under Sec. 44(d) on Swiss Reg. No. 160,055, dated Feb. 14, 1956.
For Shock Absorbers for Watches and Parts of Watches.

## CLASS 28

## JEWELRY AND PRECIOUS-METAL WARE

SN 1,154. Gale Creations, Inc., New York, N. Y. Filed Jan. 20, 1956.

For Costume Jewelry, Not Including Watches.
First use July 1, 1955.

SN 12,820. D. Lisner & Co. Inc., New York, N. Y. Filed July 25, 1956.

JUNIOR PROM

For Jewelry—Namely, Necklaces, Bracelets, Earrings, and Brooches for Personal Wear or Adornment, Not Including Watches.
First use June 11, 1956.

## CLASS 31

## FILTERS AND REFRIGERATORS

SN 2,680. Arizona Minerals Corporation, Yuma, Ariz. Filed Feb. 15, 1956.

AMCO

For Water Conditioning Material—Namely, Natural Ion Exchange Materials, Artificial Sodium Aluminosilicate Cation Exchange Material, Artificial Resinous Cation, and Anion Exchange Materials.
First use Oct. 3, 1955.

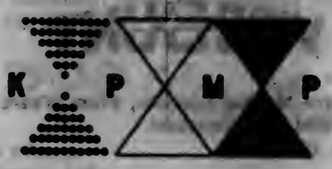
SN 3,343. The Barnebey-Cheney Company, Columbus, Ohio. Filed Feb. 27, 1956.

BLACK MAGIC

For Gas and Liquid-Conditioning Filters Containing Activated Charcoal.
First use Oct. 24, 1955.

SN 8,186. Carl L. Boehler, d. b. a. C. L. B. Company, Houston, Tex., to C. L. B. Company, Houston, Tex. Filed May 14, 1956.

CLIP IT



For Air Filters.
First use on or about Apr. 11, 1956.

SN 9,646. Kwikset Locks, Inc., Anaheim, Calif. Filed June 5, 1956.

Owner of Reg. Nos. 518,394, 625,287, and others.
For Filters.
First use Dec. 9, 1954.

SN 9,650. Kwikset Locks, Inc., Anaheim, Calif. Filed June 5, 1956.

For Filters.
First use Dec. 9, 1954.

SN 9,715. Fram Corporation, Providence, R. I. Filed June 6, 1956.

FRAM

Owner of Reg. No. 337,799.
For Filters and Filter Elements for Filtering Liquids and Gases, and for Separating Liquids.
First use about September 1948.

## CLASS 32

## FURNITURE AND UPHOLSTERY

SN 685,775. Speed Products Company, Inc., Long Island City, N. Y., now by change of name Swingline, Inc. Filed Apr. 18, 1955.

Swingline

Owner of Reg. Nos. 358,506, 628,205, and others.
For Office Cabinets and Display Cabinets.
First use June 15, 1952.

SN 4,154. Sedgwick Equipment Corporation, New York, N. Y. Filed Mar. 8, 1956.

MONO-AISLE

For Storage Systems Comprising Mobile Shelving Racks Mounted on Rollers and Tracks Therefor.
First use Dec. 20, 1955.

SN 5,951. Tepper's Plainfield, Plainfield, N. J. Filed Apr. 6, 1956.

NETHERWOOD

### CLASS 2

### RECEPTACLES

637,882. TIPSY TIM. Reldon G. Pinney, d. b. a. Renel Manufacturing Company. SN 685,074. Pub. 9–18–56. Filed 4–4–55.

637,883. KEAPSIT. The American Thermos Bottle Company, now by change of name The American Thermos Products Company. SN 700,292. Pub. 9–18–56. Filed 12–20–55.

637,884. H AND DESIGN. H. D. Hudson Manufacturing Company. SN 2,037. Pub. 9–18–56. Filed 2–3–56.

637,885. BACCA-PAK. Container Corporation of America. SN 2,284. Pub. 9–18–56. Filed 2–8–56.

637,886. "QUIKTAINER." Schmidt Lithograph Company. SN 3,036. Pub. 9–18–56. Filed 2–20–56.

637,887. SALISBURY ARTISANS. The Salisbury Cutlery Handle Co., Inc. SN 4,370. Pub. 9–18–56. Filed 3–12–56.

### CLASS 3

### BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

637,888. TUMBLING THOMAS. Lester L. Cox. SN 648,374. Pub. 12–15–53. Filed 6–8–53.

### CLASS 4

### ABRASIVES AND POLISHING MATERIALS

637,889. ALOXITE. The Carborundum Company. SN 123. Pub. 9–18–56. Filed 1–9–56.

637,890. "AERO-POWER." Kent-Moore Organization, Inc. SN 1,594. Pub. 9–18–56. Filed 1–27–56.

637,891. DESIGN OF WOMAN. Fitzpatrick Bros., Inc. SN 3,934. Pub. 9–18–56. Filed 3–6–56.

### CLASS 5

### ADHESIVES

637,892. POLYMARK AND DESIGN. Polymark Limited. SN 640,062. Pub. 6–23–53. Filed 11–24–52.

637,893. HYDROCOR. Corn Products Refining Company. SN 699,623. Pub. 9–18–56. Filed 12–8–55.

637,894. LAMILITE. The Jennison-Wright Corporation. SN 2,637. Pub. 9–18–56. Filed 2–14–56.

637,895. RAPCO. Radio Active Products Corp., d. b. a. Rapco Products. SN 3,227. Pub. 9–18–56. Filed 2–23–56.

637,896. BAZOOKA PAC. Mastro Plastics Corp. SN 5,733. Pub. 9–18–56. Filed 4–3–56.

### CLASS 6

### CHEMICALS AND CHEMICAL COMPOSITIONS

637,897. VIPLA. Aziende Colori Nazionali Affini. A. C. N. A. S. p. A. SN 671,132. Pub. 9–18–56. Filed 8–5–54.

637,898. SH-BOOM. Demert & Dougherty, Inc. SN 689,815. Pub. 9–18–56. Filed 6–20–55.

637,899. NEUTROLOX. The Pennsylvania Salt Manufacturing Company. SN 690,190. Pub. 9–18–56. Filed 6–24–55.

637,900. COLORSLIP. C. G. Pardee Co., Inc. SN 690,314. Pub. 9–18–56. Filed 6–27–55.

637,901. TEXCOLOR. C. G. Pardee Co., Inc. SN 690,316. Pub. 9–18–56. Filed 6–27–55.

637,902. AVCOSET. American Viscose Corporation. SN 690,424. Pub. 9–18–56. Filed 6–29–55.

637,903. BRIFISOL. Joh. A. Benckiser GMBH. SN 690,524. Pub. 9–18–56. Filed 6–30–55.

637,904. BELORAN. Ciba Limited. SN 690,534. Pub. 9–18–56. Filed 6–30–55.

637,905. FUNGITEX. Ciba Limited. SN 690,537. Pub. 9–18–56. Filed 6–30–55.

637,906. LANFRAX. Malmstrom Chemical Corp. SN 692,723. Pub. 9–18–56. Filed 8–9–55.

637,907. LANURGIC. Malmstrom Chemical Corp. SN 692,725. Pub. 9–18–56. Filed 8–9–55.

637,908. CAVIARE CUT. Imperial Chemical Industries Limited. SN 697,555. Pub. 9–18–56. Filed 11–2–55.

637,909. LUKONITE. Lukon, Inc. SN 700,039. Pub. 9–18–56. Filed 12–15–55.

637,910. GRAVIDIAN. Remington-Douglas Corp. SN 165. Pub. 9–18–56. Filed 1–4–56.

637,911. MWM AND DESIGN. Mid-West Mineral Co. SN 351. Pub. 9–18–56. Filed 1–9–56.

637,912. LOMAR. Jacques Wolf & Co. SN 2,473. Pub. 9–18–56. Filed 1–17–56.

637,913. MOBILBEAD. Socony Mobil Oil Company, Inc. SN 2,917. Pub. 9–18–56. Filed 2–17–56.

637,914. GRAINULOSE. Malt Products Corporation of New Jersey. SN 3,210. Pub. 9–18–56. Filed 2–23–56.

### CLASS 7

### CORDAGE

637,915. VHS. American Chain & Cable Company, Inc. SN 5,010. Pub. 9–18–56. Filed 3–22–56.

637,916. DUALOC. American Chain & Cable Company, Inc. SN 5,815. Pub. 9–18–56. Filed 4–5–56.

### CLASS 9

### EXPLOSIVES, FIREARMS, EQUIPMENTS, AND PROJECTILES

637,917. ZIPPER. The Marlin Firearms Company. SN 688,438. Pub. 9–18–56. Filed 5–27–55.

### CLASS 10

### FERTILIZERS

637,918. BOVUNG. Walker-Gordon Laboratory Company, Inc. SN 2,732. Pub. 9–18–56. Filed 2–15–56.

637,919. RATH BLACK HAWK AND DESIGN. The Rath Packing Company. SN 5,869. Pub. 9–18–56. Filed 4–5–56.

637,920. STEAMBOAT AND DESIGN. Mississippi River Fuel Corporation, d. b. a. Mississippi River Chemical Company. SN 6,030. Pub. 9–18–56. Filed 4–9–56.

### CLASS 11

### INKS AND INKING MATERIALS

637,921. CITATION. Manifold Supplies Company. SN 5,652. Pub. 9–18–56. Filed 4–2–56.

637,922. FLEXOGEM. Interchemical Corporation. SN 5,729. Pub. 9–18–56. Filed 4–3–56.

### CLASS 12

### CONSTRUCTION MATERIALS

637,923. LITE HOUSE AND DESIGN. Walter M. Krants, d. b. a. Lite House Storm Window Company. SN 644,326. Pub. 2–8–55. Filed 3–27–53.

637,924. STAYON. Colonial Cedar Company, Inc. SN 684,400. Pub. 9–18–56. Filed 3–29–55.

637,925. CONTINENTAL HOMES AND DESIGN. Continental Homes, Inc. SN 699,476. Pub. 9–18–56. Filed 12–6–55.

### CLASS 15

### OILS AND GREASES

637,926. RED LINE 76 AND DESIGN. Union Oil Company of California. SN 687,425. Pub. 9–18–56. Filed 5–12–55.

### CLASS 16

### PROTECTIVE AND DECORATIVE COATINGS

637,927. ACRYLOTONE. Robert G. Gibbs, d. b. a. Gibbs Chemical Company. SN 3,531. Pub. 9–18–56. Filed 2–28–56.

637,928. WONDER-MATIC YOUR COLOR LIBRARY. Devoe & Raynolds Company, Inc. SN 4,697. Pub. 9–18–56. Filed 3–16–56.

637,929. WONDER-PRUF. Devoe & Raynolds Company, Inc. SN 4,893. Pub. 9–18–56. Filed 3–20–56.

637,930. SHER-GIDE. The Sherwin-Williams Company. SN 4,992. Pub. 9–18–56. Filed 3–21–56.

### CLASS 18

### MEDICINES AND PHARMACEUTICAL PREPARATIONS

637,931. ENERGAL. Pharmaceutical Corporation of America. SN 656,837. Pub. 6–29–54. Filed 11–23–53.

637,932. DARTRINS. Norman Dartell, d. b. a. Dartell Laboratories. SN 676,183. Pub. 6–21–55. Filed 11–8–54.

637,933. BECHOLINE. W. James Taylor, d. b. a. Taylor Drug Company. SN 690,765. Pub. 9–18–56. Filed 7–5–55.

637,934. ANBESOL ETC. AND DESIGN. The Anbesol Company, Inc. SN 692,758. Pub. 9–18–56. Filed 8–10–55.

637,935. THREE LOST LINKS. Billings Lee. SN 693,156. Pub. 9–18–56. Filed 8–16–55.

637,936. FOOT JOY AND DESIGN. Ernie Barbush. SN 695,135. Pub. 9–18–56. Filed 9–22–55.

637,937. LIPNOCAINE. Barfred Research Laboratories. SN 695 679. Pub. 9–18–56. Filed 10–3–55.

637,938. PANATAL. Gray Pharmaceutical Company, to Warner-Lambert Pharmaceutical Company, Inc. SN 697,548. Pub. 9–18–56. Filed 11–2–55.

637,939. CHYMAR. Armour and Company. SN 698,395. Pub. 9–18–56. Filed 11–17–55.

637,940. TRISULES. Charles C. Haskell & Co., Inc. SN 698,521. Pub. 9–18–56. Filed 11–18–55.

637,941. CYTOMEL. Smith Kline & French Laboratories. SN 698,555. Pub. 9–18–56. Filed 11–18–55.

637,942. DR. MACDONALD'S THRIFT-T-MIX. Robert W. Dodds, administrator of the estate of John R. Macdonald, deceased, d. b. a. Dr. Macdonald's Vitamised Feed Co. SN 700,205. Pub. 9–18–56. Filed 12–19–55.

637,943. IVERSAL. Farbenfabriken Bayer Aktiengesellschaft. SN 585. Pub. 9–18–56. Filed 1–12–56.

637,944. PRADASE. E. S. Miller Laboratories, Inc. SN 818. Pub. 9–18–56. Filed 1–16–56.

637,945. ALBAMYCIN. The Upjohn Company. SN 1,297. Pub. 9–18–56. Filed 1–23–56.

637,946. AQUATRACIN. Whitmoyer Laboratories, Inc. SN 2,733. Pub. 9–18–56. Filed 2–15–56.

637,947. CODISTAN. Chicago Pharmacal Company. SN 3,652. Pub. 9–18–56. Filed 3–1–56.

637,948. ANCHOL. G. D. Searle & Co. SN 3,773. Pub. 9–18–56. Filed 3–2–56.

637,949. MEDIHALER-EPI. Riker Laboratories, Inc. SN 4,148. Pub. 9–18–56. Filed 3–8–56.

637,950. MEDIHALER-ISO. Riker Laboratories, Inc. SN 4,149. Pub. 9–18–56. Filed 3–8–56.

637,951. TENTITE. George Gibson Meredith. SN 4,340. Pub. 9–18–56. Filed 3–12–56.

637,952. SINTOCINON. Sandoz Chemical Works, Inc. SN 4,480. Pub. 9–18–56. Filed 3–13–56.

637,953. PYRIHIST. Ormont Drug & Chemical Company, Inc. SN 4,558. Pub. 9–18–56. Filed 3–14–56.

637,954. PYRIMIST. Ormont Drug & Chemical Company, Inc. SN 4,559. Pub. 9–18–56. Filed 3–14–56.

637,955. C. B. F. U. S. Vitamin Corporation. SN 4,590. Pub. 9–18–56. Filed 3–14–56.

637,956. NUTRI-SCIENCE. Nutritional Science Corporation. SN 4,659. Pub. 9–18–56. Filed 3–15–56.

637,957. TYLENOL. McNeil Laboratories, Incorporated. SN 4,815. Pub. 9–18–56. Filed 3–19–56.

637,958. BISLUMINA. Mining and Chemical Products Limited. SN 4,817. Pub. 9–18–56. Filed 3–19–56.

# PATENTS

## NOTICES

### Adjudicated Patents

(D. C. Pa.) Chott Patent No. 2,286,599 (241—175), for mortar and pestle. Claims 1 to 3 *Held* valid but not infringed. *Crescent Dental Manufacturing Company* v. *The S. S. White Dental Manufacturing Company*, 144 F. Supp. 1; 111 USPQ 88.

(D. C. Mich.) Belden Patent No. 2,458,134 (160—223), for an adjustable ventilator, *Held* invalid. *Belden et al., doing business as Louver Manufacturing & Supply Company* v. *Air Control Products, Inc.*, 144 F. Supp. 248; 111 USPQ 9.

(D. C. Calif.) Slopa Patent No. 2,521,756 (16—131), for an overlapping hinge, *Held* invalid. *Butcher Boy Refrigerator Door Co.* v. *Phillips Refrigeration Products Co.*, 144 F. Supp. 331; — USPQ —.

(D. C. Calif.) Slopa Patent No. 2,535,324 (16—131), for a compensating hinge. Claims 1, 2, 3, 4, 5, and 7 *Held* invalid. *Id.*

(D. C. Calif.) Slopa Patent No. 2,586,573 (16—131), for an infitting type hinge, *Held* invalid. *Id.*

(D. C. Md.) Collins Patent No. 2,667,218 (160—84), for a folding closure. Claim 10 *Held* valid and infringed. *Collins* v. *Kraft*, 144 F. Supp. 162; — USPQ —.

(D. C. N. Y.) Guide Patent No. 2,674,963 (112—2), for a spiral seam producing mechanism for sewing machines. Claims 1 to 3, 6, 7, 12, and 14 *Held* invalid. *Guide* v. *Desperak et al., doing business as Advance Sewing Machine Company; Same* v. *Advance Spiral Machine Company, Inc.*, 144 F. Supp. 182; 111 USPQ 32.

(D. C. Calif.) Slopa Design Patent No. 157,294 (D10—9), for a hinge, *Held* invalid. *Butcher Boy Refrigerator Door Co.* v. *Phillips Refrigeration Products Co.*, 144 F. Supp. 331; — USPQ —.

### Classification Order No. 206

Classification Order No. 206, dated November 23, 1956, incorporates changes in the following classes:

Classes 12, 95, 96, 317

The above changes will be incorporated in the Manual of Classification replacement sheets dated January 1957.

M. C. ROSA,
Nov. 21, 1956. *Director, Patent Examining Operation.*

### Disclaimers

2,649,564.—*Frederick William Meredith*, London, England. AUTOMATIC CONTROL SYSTEMS. Patent dated Aug. 18, 1953. Disclaimer filed Nov. 2, 1956, by the assignee, *Minneapolis-Honeywell Regulator Company.*

Hereby enters this disclaimer to claims 1, 3, 5, 6, 11, and 12 of said patent.

2,708,415.—*Ernest Contelo White*, Bronxville, N. Y. NEEDLE STOP APPARATUS FOR POWER-DRIVEN SEWING MACHINES. Patent dated May 17, 1955. Disclaimer filed Oct. 26, 1956, by the assignee, *The Singer Manufacturing Company.*

Hereby enters this disclaimer to claim 11 of said patent.

### Patents Available for Licensing or Sale

2,737,738. Article Protector for Ironing Boards and the Like (Mounted on Floor To Protect Articles From Soiling). Marylie W. Montgomery and Jesse N. Williams, Jr., 422 West Fifth St., Greenville, N. C.

2,770,023. Press Fastener (for Penetrating and Securing Together Papers and the Like). Peter Michalsky, 197 Cambridge Ave., Garfield, N. J.

General Electric Company is prepared to grant nonexclusive licenses on reasonable terms under the following 33 patents to domestic manufacturers.

Applications for license may be addressed to: Patent Counsel, Switchgear & Control Division, General Electric Company, 6901 Elmwood Ave., Philadelphia 42, Pa.

2,212,399. Protection of Alternating Current Electric Systems.
2,222,719. Air Blast Circuit Breaker.
2,233,362. System of Electric Distribution.
2,243,575. Multiple Switching Apparatus and Method.
2,269,233. Electrical Conductor.
2,277,522. Phase Sequence Apparatus.
2,282,065. Electromagnetic Device.
2,284,840. Fluid Blast Circuit Breaker.
2,285,191. Automatic Reclosing Circuit Breaker Equipment.
2,296,099. Protection of Alternating Current Electric Power Systems.
2,306,240. Gas Blast Circuit Breaker.
2,315,468. Protective System.
Re.22,498. Mounting Electrical Apparatus.
2,347,493. Protection of Alternating Current Electric Power Systems.
2,348,026. Electric Power Transmission System.
2,360,110. Electric Circuit.
2,360,172. Supervisory System.
2,366,493. Electric Circuit.
2,374,994. Electric Protective Arrangement.
2,378,268. Protective Apparatus.
2,378,752. Electric Power Transmission System.
2,380,805. Protective System.
2,381,375. Protective Apparatus.
2,381,527. Protective Apparatus.
2,383,329. Protective System.

### New Applications Received During October 1956

| | |
|---|---|
| Patents | 6,722 |
| Designs | 473 |
| Plants | 9 |
| Reissues | 21 |
| Total | 7,225 |

### Issue

| | | | |
|---|---|---|---|
| Patents | 815 | No. 2,773,258 to No. | 2,774,072, incl. |
| Designs | 38 | No. 179,366 to No. | 179,403, incl. |
| Plant Pats | 3 | No. 1,534 to No. | 1,538, incl. |
| Reissues | 4 | No. 24,253 to No. | 24,256, incl. |
| | 862 | | |

| | | | |
|---|---|---|---|
| 2,396,635. | Protective System. | 2,416,951. | Switching Means. |
| 2,399,942. | Circuit Breaker Operating System. | 2,445,588. | Electrical Switchgear. |
| 2,398,648. | Protection of Electric Systems. | 2,454,973. | Polarised Electromagnetic Control Device. |
| 2,405,696. | Relay Protective Arrangement. | 2,756,306. | Circuit Breaker Operating Mechanism. |

# CONDITION OF PATENT APPLICATIONS AS OF OCTOBER 31, 1956

| | |
|---|---|
| Total number of pending applications (excluding Designs) | 217,058 |
| Total number of pending Design applications | 6,321 |
| Total number of applications awaiting action (excluding Designs) | 117,257 |
| Total number of Design applications awaiting action | 2,972 |
| Date of oldest new application | June 27, 1955 |
| Date of oldest amended application | June 18, 1954 |

ROSA, M. C., Director, Patent Examining Operation

| PATENT EXAMINING GROUPS, AND SUPERVISORY EXAMINERS | DIVISIONS |
|---|---|
| I. STONE, I. G., CHEMICAL AND RELATED ARTS | 6, 31, 38, 45, 46, 50, 52, 59, 60, 63, 64. |
| II. STRACHAN, C. W., COMMUNICATIONS, RADIANT ENERGY AND ELECTRICAL ARTS | 16, 22, 25, 27, 42, 44, 49, 52, 54, 60, 76. |
| III. YUNG KWAI, B., MECHANICAL MANUFACTURING, MACHINE ELEMENTS AND DESIGNS | 2, 12, 13, 14, 21, 24, 57, 58, 61, Designs. |
| IV. FREEHOF, H. B., MATERIAL HANDLING AND TREATING, OPTICS, RAILWAYS AND AMUSEMENT DEVICES. | 7, 11, 17, 27, 34, 35, 39, 53, 62. |
| V. HULL, J. S., STATIC STRUCTURES AND INSTRUMENTS OF PRECISION | 5, 20, 30, 33, 36, 40, 41, 55, 66. |
| VI. MURPHY, T. F., AGRICULTURE, TRANSPORTATION, PUMPS AND MOTORS | 1, 4, 8, 9, 10, 18, 32, 38, 45, 47. |
| VII. KAUFFMAN, H. E., HEATING AND COOLING, PLASTIC SHAPING AND COATING, SEPARATION AND MIXING, BODY TREATMENT AND CARE. | 3, 15, 19, 25, 30, 32, 48, 55, 67. |
| CL. GORECKI, G. A., ARTS UNDERGOING RECLASSIFICATION AS LISTED UNDER CLASSIFICATION DIVISIONS. | I, II, III, IV, V. |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Amended |
|---|---|---|
| 1. (VI) GOLDBERG, A. J., Brakes; Excavating; Planting; Plant Husbandry; Scattering Unloaders | 11- 9-55 | 1- 3-55 |
| 2. (III) HERRMANN, D., Fishing, Trapping and Vermin Destroying; Presses; Tobacco; Textile Wringers | 2- 6-56 | 8- 2-55 |
| 3. (VII) LE ROY, C. A., Metal Founding and Treatment; Metallurgy (Process and Apparatus); Alloys | 3-19-56 | 1-14-55 |
| 4. (VI) FALLER, E. A., Hoists; Power Driven Conveyors; Handling Apparatus; Elevators; Feeding of Indefinite Lengths | 2- 1-56 | 2-10-55 |
| 5. (VI) ROBINSON, C. W., Harvesters; Potato Diggers; Stalk Pullers and Choppers; Stone Gatherers; Threshing; Knotters; Animal Husbandry; Bee Culture; Dairy; Butchering; Vegetable and Meat Cutters and Comminutors; Fences; Gates | 2- 6-56 | 7- 5-55 |
| 6. (I) SURLE, H., Carbon Chemistry (part), e. g. Natural Resins, Proteins, Heterocyclic Amides, Amines, General Organic Processes | 7-20-55 | 5-10-55 |
| 7. (IV) GONSALVES, J. E., Optics, Photographic Apparatus | 12-23-55 | 2-21-55 |
| 8. (V) LEWIS, R. O., Beds; Chairs and Seats; Cabinets; Tables; Miscellaneous Furniture | 9-20-55 | 1- 5-55 |
| 9. (VI) BRANSON, J. H., Pumps; Fans; Turbines | 2- 1-56 | 2-14-55 |
| 10. (VI) BOYD, S., Firearms; Ordnance; Ammunition; Explosive Charge Making | 10-26-55 | 1-20-55 |
| 11. (IV) BENHAM, E. V., Boots, Shoes and Leggings; Shoe and Leather Manufacture; Button, Eyelet and Rivet Setting; Nailing, Stapling and Clip Classifying; Card, Picture and Sign Exhibiting; Cutlery; Cleaning and Liquid Treatment of Solids | 1- 3-56 | 2-10-55 |
| 12. (III) SPINTMAN, S., Machine Elements; Engine Starters; Interrelated Clutch and Motor Controls | 10-11-55 | 9-16-54 |
| 13. (III) BEALL, T. E., Gear Cutting; Electric Lamp and Tube Manufacture; Needle and Pin Making; Metal Working (part), e. g. Special Work, Forging, Plastic Working, Drawing, Sawing, Milling, Planing, Turning | 1-10-56 | 11-23-54 |
| 14. (III) MANIAN, J. C., Metal Working (part), e. g. Sheet Metal, Wire Bending, Miscellaneous Processes, Assembly and Disassembly Apparatus; Wire Fabrics; Air Brakes | 11-14-55 | 11-16-54 |
| 15. (VII) BRINDISI, M. V., Plastics; Plastic Block and Earthenware Apparatus; Glass | 2- 1-56 | 12- 6-54 |
| 16. (II) LOVEWELL, N. N., Televistas; Telephony; Recorders | 10-19-55 | 8-30-54 |
| 17. (IV) LEIGHEY, R. A., Paper Manufactures; Packaging; Typewriters; Printing; Type Casting and Setting; Sheet Material Association or Folding; Sheet or Web Feeding | 12-15-55 | 1-17-55 |
| 18. (VI) BLUM, A., Power Plants; Fluid Transmissions; Servomotor Systems; Jet Motors; Combustion Turbines; Speed Responsive Devices | 12-19-55 | 12- 8-54 |
| 19. (VII) PATRICK, P. L., Stoves and Furnaces; Boilers; Concentrating Evaporators; Fluid Fuel Burners | 1- 5-56 | 4-20-55 |
| 20. (V) BROWN, L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Safes; Bank Protection; Bread, Pastry and Confection Making; Tents and Canopies; Umbrellas; Canes; Undertaking | 2-20-56 | 2-10-55 |
| 21. (III) MADER, R. C., Textiles | 1-20-56 | 1-20-55 |
| 22. (VI) MARLAND, M. L., Aeronautics; Boats; Buoys; Ships; Marine Propulsion; Propellers; Windmills; Fluid Dispragms and Bellows; Boring and Drilling | 12-27-55 | 12- 6-54 |
| 23. (II) ANDRUS, L. M., Cash and Fare Registers; Calculators and Counters; Education | 8-29-55 | 7-16-54 |
| 24. (III) DRACOPOULOS, P. T. (HICKEY, T. J., acting), Apparel (except Corsets and Brassieres); Apparel Apparatus; Sewing Machines; Textiles, Ironing or Smoothing; Clutches and Power-Stop Control | 2- 9-56 | 2- 2-56 |
| 25. (VII) NEVIUS, R. D., Casting—Processes, Miscellaneous Products and Apparatus; Distillation; Wood Treating Apparatus | 1- 3-56 | 6- 8-55 |
| 26. (II) YOUNG, R. R., Electricity—Generation, Motive Power, Transmission Systems, Voltage and Phase Control Systems, Furnaces, Battery Charging and Discharging, Arc Lamps, Prime Mover Dynamo Plants; Elevators (part), e. g. Miscellaneous Electric Control Mechanism | 2- 5-56 | 9- 2-55 |
| 27. (IV) JAMES, S., Brushing, Scrubbing and General Cleaning; Brush, Broom and Mop Making | 2- 1-56 | 2-28-55 |
| 28. (VI) BRAUNER, R. H., Internal Combustion Engines; Expansible Chamber Motors; Fluid Servomotors; Spring, Weight and Animal Powered Motors; Cylinders; Pistons; Drive Shafts; Flexible-Shaft Couplings; Chucks or Sockets; Chute, Skid, Guide and Way Conveyors; Fluid Current Conveyors; Pressure Modulating Relays; Pneumatic Dispatch; Store Service; Wheel Substitutes | 10-26-55 | 2-21-55 |
| 29. (V) HABECKER, L. B., Tools; Woodworking; Button, Barrel and Wheel Making; Rubber Tire Removing Tools; Washing Machines; Baggage; Cloth, Leather and Rubber Receptacles; Package and Article Carriers | 12- 2-55 | 11-23-55 |
| 30. (VII) O'LEARY, R. A., Refrigeration; Heating Systems; Automatic Temperature and Humidity Regulation, Thermostats, Humidistats; Illuminating Burners; Miscellaneous Heating | 6- 2-56 | 7- 5-55 |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application | |
|---|---|---|
| | New | Amended |
| 31. (I) HUTCHISON, E. W., Carbon Chemistry (part), e. g. Urea Adducts, Silicon Containing Carbon Compounds, Hydrogenation of Carbon Oxides, Partial Oxidation of Non-Aromatic Hydrocarbon Mixtures, Hydrocarbons, Halogenated Hydrocarbons | 12-29-55 | 11-17-55 |
| 32. (VII) BERMAN, H., Gas and Liquid Contact Apparatus; Heat Exchange; Gas Separation; Agitation; Self Proportioning Fluid Systems; Liquid Level Responsive Systems; Fire Extinguishers | 2-15-56 | 8- 1-55 |
| 33. (V) MUSHAKE, W. L., Bridges; Hydraulic and Earth Engineering; Building Structures; Roads and Pavements | 2- 1-56 | 12- 3-54 |
| 34. (IV) SAPERSTEIN, S., Railways—Draft Appliances, Switches and Signals, Surface Track, Rolling Stock, Track Sanders; Electricity, Transmission to Vehicles; Dumping Vehicles; Vehicle Fenders; Hand and Hoist Line Implements | 12-19-55 | 9-13-54 |
| 35. (IV) BROMLEY, E. D., Dispensing; Fluent Material Handling, Filling; Toilet, Kitchen and Table Articles | 12- 9-55 | 2-14-55 |
| 36. (V) McFADYEN, A. D., Measuring and Testing | 11- 2-55 | 10-19-55 |
| 37. (II) LEVY, M. L., Electricity—Switches, Welding, Heating | 11-30-55 | 5-11-55 |
| 38. (I) MARMELSTEIN, N., Carbon Chemistry (part), e. g., Azo, Carbocyclic or Acyclic Compounds (part), e. g. Anthrones, Triarylmethanes, Esters, Acids, Ketones, Aldehydes, Ethers, Phenols, Alcohols | 3- 1-56 | 10-11-55 |
| 39. (IV) WEIL, I., Fluid-Pressure Regulators; Valves; Fluid Handling (except Pressure Modulating Relays, Self-Proportioning Systems, Float Valves, Diaphragms and Bellows) | 1-31-56 | 11-10-54 |
| 40. (V) DRUMMOND, E. J., Receptacles—Metallic, Paper, Wooden, Glass; Special Receptacles and Packages | 3- 1-56 | 10- 3-55 |
| 41. (V) GURLEY, R. B., Coin Controlled Apparatus; Dispensing Cabinets; Coin Handling; Mail, Fare or Other Collection Boxes or Chutes; Buckles, Buttons and Clasps; Racks; Fire Escapes; Ladders; Scaffolds | 10- 3-55 | 9-16-54 |
| 42. (II) MARANS, H., Electric Signaling; Signals and Indicators; Telegraphy; Electrical Connectors | 6-27-55 | 11- 3-54 |
| 43. (I) ARNOLD, D., Medicines; Poisons, Cosmetics; Sugar and Starch; Skins, and Leathers; Preserving, Sterilising and Disinfecting (except Wood Treatment Apparatus) | 11- 2-55 | 4- 1-55 |
| 44. (II) EVANS, N. H., Antennas; Automatic Pilots; Directive Radio Systems; Mass Spectrometers; Nuclear Batteries; Nuclear Resonant Devices; Neutron Detecting and Measuring; Radar; Sonar; Torpedoes | 7-29-55 | 6-18-54 |
| 45. (VI) MANIAN, J. A., Wheels, Tires and Axles; Railway Wheels and Axles; Lubrication; Bearings and Guides; Belt and Sprocket Gearing; Spring Devices; Animal Draft Appliances | 11- 4-55 | 2-18-55 |
| 46. (I) WILES, W. G., Actinide Series (e. g., fissionable) Compounds; Sintered Metal Stock; Explosives; Power Plants (part); Metallurgy (part); Surgery (part); Radioactive Medicines; Irradiation Chemistry; Carbon Chemistry (part) | 12- 7-55 | 1-13-55 |
| 47. (VI) KANOF, W. J., Mining, Quarrying, and Ice Harvesting; Motor Vehicles; Land Vehicles | 2- 6-56 | 9-13-55 |
| 48. (II) BERNSTEIN, S., Electricity—Conversion Systems, Protective Systems; Measuring and Testing (except Meters); Spark Plugs and Ignition Systems, Switchboards, Relays, Magnets, Inductors, Transformers, Condensers, Transistors, Barrier Layer Rectifiers | 7-29-55 | 9-23-54 |
| 49. (VII) BENDETT, B., Drying and Gas or Vapor Contact with Solids; Ventilation; Wells; Earth Boring | 11-21-55 | 4- 4-55 |
| 50. (I) BENGEL, W. G., Carbon Chemistry (part), e. g. Synthetic Resin Compositions, Synthetic Rubber Compositions, Natural Rubber | 1- 6-56 | 11- 3-54 |
| 51. (II) YAFFEE, S., Radio Transmitters, Receivers and Tuners; Modulators; Piezoelectric Devices; Music | 3- 1-56 | 9-13-54 |
| 52. (V) NEFF, P. R., Supports Joint Packing; Valved Pipe Joints or Couplings; Rod Joints or Couplings; Tool Handle Fastenings; Pipes and Tubular Conduits; Shaft Packing | 12- 8-55 | 12-24-54 |
| 53. (IV) REYNOLDS, E. R., (NINAS, G. A., acting), Label Pasting and Paper Hanging; Books and Book Making; Manifolding; Printed Matter; Stationery; Paper Files and Binders; Flexible or Portable Closures or Partitions; Doors, Windows, Awnings and Shutters; Harness; Whip Apparatus | 1-20-56 | 5-24-55 |
| 54. (II) NILSON, R. G., Electric Lamps; Electronic Tubes; Miscellaneous Discharge Devices; Lamp, Cathode Ray and Gas Discharge Device Circuits; Ray Energy (e. g. X-Ray, Ultraviolet, Radioactive) Applications | 12-12-55 | 12- 1-54 |
| 55. (VII) KLINE, J. R., Surgery; Dentistry; Artificial Body Members; Separating and Sorting Solids; Centrifugal Bowl Separators; Comminuters | 8-29-55 | 12- 1-54 |
| 56. (I) SPECK, J. R., Abrading Compositions; Batteries; Casting or Plastic Compositions; Electrical and Wave Energy Chemistry | 1-26-56 | 11-18-55 |
| 57. (III) MILLER, A. B., Bolt, Nut, Rivet, Nail, Screw, Chain and Horseshoe Making; Driven and Screw Fastenings; Nut and Bolt Locks; Jewelry; Pipe Joints or Couplings | 4-10-56 | 8- 8-55 |
| 58. (III) BRONAUGH, F. H., Rolls and Rollers; Making Metal Tools and Implements; Stone Working; Abrading Processes and Apparatus; Feed Apparatus; Closure Operators; Baths, Closets, Sinks and Spittoons | 12-14-55 | 4-21-55 |
| 59. (I) HENKIN, B., Inorganic Chemistry; Fertilizers; Gas, Heating and Illuminating | 12-19-55 | 3-24-55 |
| 60. (I) MANGAN, P. E., Carbon Chemistry (part), e. g., Synthetic Resins, Synthetic Rubber; Photographic Processes and Products | 12-28-55 | 1-24-55 |
| 61. (III) MORSE (Miss), E. L., Winding and Reeling; Pushing and Pulling; Horology; Time Controlling Apparatus; Railway Mail Delivery | 3- 6-56 | 3-16-55 |
| 62. (IV) SHAPIRO, A., Games; Toys; Amusements and Exercising Devices; Mechanical Guns and Projectors; Illumination | 3- 6-56 | 8-17-55 |
| 63. (I) WINKELSTEIN, A. H., Foods and Beverages; Carbon Chemistry (part), e. g., Lignins, Carbohydrate Derivatives; Fats and Metal Containing Carboxylic or Acyclic Carbon Compounds | 3- 1-56 | 1-13-55 |
| 64. (I) GREENWALD, J., Fuels; Miscellaneous Compositions | 2-13-56 | 1- 3-55 |
| 66. (V) LISANN, L., Geometric Instruments; Automatic Weighing Scales; Acoustics | 12-23-55 | 9- 7-54 |
| 67. (VII) KRAFFT, C. F., Laminated Fabrics; Ornamentation; Bleaching, Dyeing, Fluid Treatment of Textiles | 9-26-55 | 2-18-55 |
| 69. (II) GALVIN, D. J., Wave Guides; Electric Meters; Sound Recording; Conductors; Insulators | 1- 3-56 | 8-11-54 |

| CLASS. DIVS. III WAHL, R. A., Cutting and Punching; Apparel (part), e. g., Corsets and Brassieres | 1-18-56 | 8- 3-55 |
| CLASS. DIVS. IV SMITH (Mrs.), M. P., Harrows and Diggers; Plows; Fluid Sprinkling, Spraying and Diffusing | 1-26-56 | 8-24-55 |
| CLASS. DIVS. V ANGLE, C. D., Liquid Separation or Purification; Sewerage | 3- 2-56 | 3- 1-56 |
| DESIGNS (III) A—MONCURE, J. A. (acting), Industrial Arts | 4- 4-56 | 3- 3-56 |
| DESIGNS (III) B—GRAY, M. A., Household, Personal and Fine Arts | 3-19-56 | 4-17-56 |

The following divisions have been abolished: 65 and 68

## EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during December 1956, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1953*.

Patents ..... Numbers 2,181,858 to 2,185,169, inclusive
Plant Patent ..... Numbers 349 to 351, inclusive

# PATENT SUITS

Notices under 35 U. S. C. 290; Patent Act of 1952

2,170,858, E. F. Andrews, Power scarer, filed Nov. 7, 1956, Ct. Cls., Doc. 480/56, *Edward Penn Andrews* v. *The United States*.

2,266,825, E. G. Streckfuss, Strip dispensing machine; 2,272,440, 2,231,635, same, Form issuing machine, filed Apr. 11, 1949, D. C. Del. (Wilmington), Doc. 1204, *Ralph W. Brown* v. *Imautograph, Inc.* Stipulation and order holding patents valid; claims held not infringed; complaint and counterclaim dismissed Jan. 26, 1951.

2,272,440. (See 2,266,825.)

2,231,635. (See 2,266,825.)

2,486,217, R. J. McCall, Wagon unloader and motor drive unit therefor, filed Nov. 2, 1956, D. C., S. D. Ohio (Columbus), Doc. 4825, *The Five Mfg. Co., Inc.* v. *The Claffey Machine & Mfg. Co.*

2,637,251, F. J. Spiess, Glued flap box folding machine, filed Oct. 29, 1956, D. C., N. D. Calif. (San Francisco), Doc. 35950, *H & C Engineering Corp.* v. *Kieckhefer Container Co.*

2,667,906. (See Re. 24,166.)

2,673,976, C. M. Williams et al., Display sign; Des. 176,653, C. M. Williams, Rotatable display sign, filed Oct. 31, 1956, D. C., E. D. Ill. (Danville), Doc. 1494–D, *American Sign and Indicator Corp.* v. *Time-O-Matic Co. et al.*

2,674,963, A. Guide, Spiral seam producing mechanism for sewing machines, appeal filed Nov. 5, 1956, C. C. A., 2nd Cir., Doc. 24378, *Anthony Guide* v. *Sam Desperak et al.* Same, Doc. 24379, *Anthony Guide* v. *Advance Spiral Machine Co., Inc.*

2,680,945, J. N. Reed, Combined mower and trimmer, filed Nov. 6, 1956, D. C., S. D. Fla. (Miami), Doc. 7260–M, *J. N. Reed* v. *Lawn Mowing & Equipment Mfg. Co.* Same, Doc. 7261–M, *J. N. Reed* v. *Power Equipment Mfg. Co.*

Re. 24,166 (of 2,667,906), B. Stiller, Self-closing container, filed Oct. 31, 1956, D. C., N. D. Ohio (Cleveland), Doc. 33204, *Squeez-A-Purse Corp.* v. *Quikey Sales Co.*

Des. 176,628. (See Des. 171,463.)

Des. 171,463, Des. 176,628, E. Rodrigues, Expansible link chain for a bracelet, filed Nov. 7, 1956, D. C., S. D. N. Y., Doc. 114/277, *Jacoby-Bender, Inc.* v. *J. B. Importing Co.*

Des. 176,806, A. Armato, Self-service unit to test and store electronic tubes, filed Nov. 7, 1956, D. C., E. D. Mich. (Detroit), Doc. 16170, *U-Test-M Mfg. Co., Inc.* v. *Vu Aid, Inc.* Same, Doc. 16171, *U-Test-M Mfg. Co., Inc.* v. *BesTest Tube Testing Co. et al.*

Des. 176,653. (See 2,673,976.)

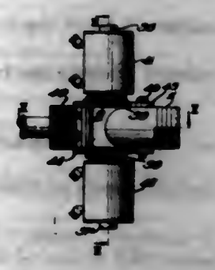
Des. 176,767, H. Benson, Child's stool, filed Nov. 8, 1956, D. C., N. D. Ill. (Chicago), Doc. 56c1876, *The Benson Co., Inc.* v. *John Plain & Co.*

# REISSUES

## DECEMBER 11, 1956

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

24,253
**METHOD OF PRODUCING A COMPOSITE LIQUID BITUMINOUS BINDER**
John F. Beaver, Piqua, Ohio
No Drawing. Original No. 2,602,774, dated July 8, 1952, Serial No. 26,475, May 11, 1948. Application for reissue July 12, 1955, Serial No. 521,655
3 Claims. (Cl. 204—52)



1. In a method of electrolytically depositing copper from a copper sulfate-sulphuric acid bath containing acetyl thiourea in an amount of from about 0.005 to 0.05 gm./l. and chloride anion in an amount of from about 0.001 to 0.015 gm./l., the step of maintaining the chloride anion concentration at a constant value within the range of about 0.001 to 0.015 gm./l. by addition of a chloride [,] *and wherein the bath is maintained at a current density of from 40 to 200 amperes per square foot.*

24,254
**DEEPWATER SUBMERSIBLE BARGE**
Robert A. J. Dawson, West University Place, Tex.
Original No. 2,653,452, dated September 29, 1953, Serial No. 85,931, April 6, 1949, which is a continuation of application Serial No. 584,330, March 23, 1945. Application for reissue August 12, 1954, Serial No. 449,535
7 Claims. (Cl. 61—46.5)

*5. A submergible barge for submarine operations comprising a principal apparatus including an elongated hollow totally closed water-tight submersible base pontoon means, said base pontoon means having a pair of spaced portions defining a lengthwise disposed opening extending from one end of said base pontoon means defining a space through which drilling operations can be conducted, means to introduce ballast into said base pontoon means and to withdraw ballast from said base pontoon means, said base pontoon means having sufficient buoyancy when without ballast to float the entire barge, an openwork rigid supporting structure secured to said base pontoon means and rising thereabove, and a floor carried by said structure above said base pontoon means and spaced therefrom a substantial distance whereby when said base pontoon means is sunk to the marine bottom in water having a lesser depth than the height of said base pontoon means plus said distance said floor will be above water; a derrick connected to said apparatus and disposed over said opening, a supplemental pontoon, rigid means connected to said apparatus, said supplemental pontoon including means co-acting with said rigid means, said rigid means constraining movement of said supplemental pontoon means to a predetermined path relative to said apparatus, said path including a position in which the center of displacement of the supplemental pontoon is above that of said base pontoon means and a position in which the center of displacement of said supplemental pontoon is close to that of said base pontoon means and successive positions intermediate therebetween as regards the vertical component of the distance between the centers of displacement of said pontoon and said pontoon means, said path being displaced from the midship section of said base pontoon means toward the end thereof opposite from said end from which extends said opening, means to introduce ballast into and to withdraw ballast from said supplemental pontoon, said supplemental pontoon when without ballast being buoyant but having less buoyancy than said base pontoon means when without ballast, and means for holding said supplemental pontoon at a desired position along said path against upward movement relative to said base pontoon means, said means for holding being adjustable as to the position along said path at which said supplemental pontoon is held, said distance of said floor above said base pontoon means being independent of the position at which said supplemental pontoon is held.*

24,255
**FLUID MIXING VALVE**
James K. Land, Oak Park, Ill., assignor to The Dole Valve Company, Chicago, Ill., a corporation of Illinois
Original No. 2,712,324, dated July 5, 1955, Serial No. 229,983, June 5, 1951. Application for reissue June 1, 1956, Serial No. 588,938
12 Claims. (Cl. 137—606)

1. A valve body comprising a hollow body part having two aligned spaced recessed outwardly facing annular wall portions, a central passageway through said wall portions opening to opposite sides of said valve body, the hollow part of said valve body defining a mixing chamber extending therealong parallel to said wall portions and intersecting said central passageway, an outlet from said valve body from one end of said mixing chamber, two spaced inlets leading into said valve body into the opposite end thereof from said outlet and extending along said body on opposite sides of said mixing chamber and parallel thereto, and separated therefrom by the walls of said passageway, and fluid passageways extending generally parallel to said central passageway for the flow of fluid from said inlets into said mixing chamber in opposed directions, including a fluid passageway from one of said inlets through one of said wall portions and another fluid passageway from the other of said inlets through the other of said wall portions.

24,256
**CROP DUSTING MACHINE**
Clarence E. Smith, Sharpsville, Ind.
Original No. 2,712,198, dated July 5, 1955, Serial No. 324,660, December 8, 1952. Application for reissue February 8, 1956, Serial No. 564,347
7 Claims. (Cl. 43—148)

*4. In a dusting machine, a wheeled chassis frame, a dust spraying boom to extend laterally to said chassis frame for use, a support on said chassis frame for providing vertical and horizontal swinging movement of said boom, means for raising and lowering said boom to provide said swinging movement, and a source of airborne dust coupled to one end of said boom, said boom comprising an elongated duct member having slots spaced from end to end of said boom in its bottom side, nozzles*

*communicating with said slots, and an adjustable gate operatively associated with at least one of said slots for controlling flow of dust from all of said nozzles.*

# PLANT PATENTS

## GRANTED DECEMBER 11, 1956

Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

1,534
**HONEY LOCUST TREE**
David B. Cole, Mentor Township, Lake County, Ohio, assignor to The Cole Nursery Company, Painesville, Ohio, a corporation of Ohio
Application December 6, 1955, Serial No. 551,463
1 Claim. (Cl. 47—59)

A new and distinct variety of thornless substantially seedless honey locust tree, *Gleditsia triacanthos* L., var. *inermis*, having a generally straight trunk, uniformly distributed well-spaced branches and fairly dense green foliage, particularly characterized in that such foliage remains green and in good condition for at least 10 days longer than the common thornless honey locust.

1,535
**ROSE PLANT**
Eugene S. Boerner, Newark, N. Y., assignor to Jackson & Perkins Company, Newark, N. Y., a corporation of New York
Application January 13, 1956, Serial No. 559,084
1 Claim. (Cl. 47—61)

A new and distinct variety of rose plant of the large-flowered polyantha class, substantially as herein shown and described, characterized particularly as to novelty by its floriferousness, its hardiness, the long-lasting quality of its flowers as cut flowers, and the distinctive Maize Yellow color of its buds which open slowly and gradually to mature flowers of a distinctive Maize Yellow lightly overcast with Buff Yellow general color tonality.

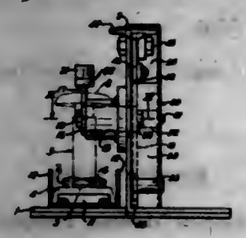
1,536
**HYBRID BUDDLEIA PLANT**
Albert Victor Pike, Chiddingstone, Kent, England, assignor to John J. Greulemans, Cleveland, Ohio
Application July 13, 1955, Serial No. 521,942
1 Claim. (Cl. 47—60)

The new and distinct hybrid species of Buddleia plant herein shown and described.

1,537
**ROSE PLANT**
Thomas Edison Meteee, Fairport, N. Y.
Application January 27, 1956, Serial No. 561,955
1 Claim. (Cl. 47—61)

A new and distinct variety of rose plant substantially as hereinabove disclosed and described, characterized as to novelty by its similarity to its parent "Vierlanden" in respect to the size, shape, texture and growth habit of its canes and foliage, but greatly distinguished therefrom by the clear light pink color of its blooms as described, by the unusually small quantity of thorns (averaging one or less to a flowering branch), by its abundant production of blooms in outdoor gardens, by its great resistance to mildew and black-spot infections and by its sweet fragrance which is a combination of those of *Rosa centifolia* and *Rosa damascena*, but without the scent of tea.

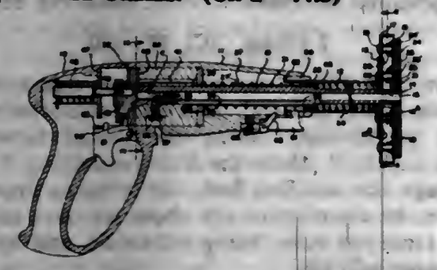
1,538
**PEACH TREE**
Grant Merrill, Red Bluff, Calif.
Application December 6, 1955, Serial No. 551,464
1 Claim. (Cl. 47—62)



A new and distinct variety of peach tree substantially as herein illustrated and described, characterized as to novelty by ripening during the period between July Elberta and J. H. Hale, the fruit resembling J. H. Hale in its large size and firm flesh, but being an improvement thereover by ripening usually about ten days earlier, and having more red color, being self-fertile, and by not having as many split pits.

# PATENTS

## GRANTED DECEMBER 11, 1956



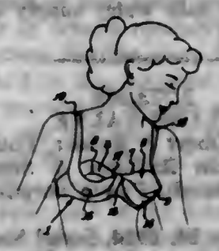
## GENERAL AND MECHANICAL

**2,773,258**
**MECHANICAL ACTUATOR FOR MANUAL STAPLER**
Frank Magidson, Pittsburgh, Pa., assignor to Pittsburgh Tag Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application October 6, 1954, Serial No. 460,591
9 Claims. (Cl. 1—3)

1. A mechanical actuator for operating a conventional manual stapler having a base and a depressible staple driving plunger, said actuator comprising a base member for receiving and holding the base of the stapler, an upright member secured to the base member, a striking head pivotally mounted on the upright member above and in striking relation to the plunger, spring means operatively connected with the striking head and one of the members for urging the striking head into striking engagement with the plunger, and releasable latch means pivotally mounted on one of the members and operatively connected with the striking head for normally holding the striking head in a cocked position out of engagement with the plunger.

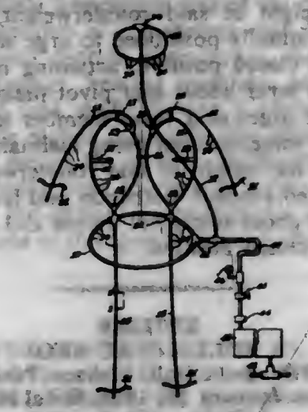
**2,773,259**
**SAFETY SHIELD FOR EXPLOSIVELY DRIVEN TOOLS**
Sidney H. Broughton and Virginius Robert Erickson, Portland, Oreg., assignors, by mesne assignments, to Joseph B. Coz, doing business as Powder Power Tool Co., Portland, Oreg.
Application May 17, 1954, Serial No. 430,288
11 Claims. (Cl. 1—44.5)

1. In a device of the character described for driving projectile fastening elements into a solid work surface, a gun barrel, a housing assembly mounted for limited slidable movement with respect to said gun barrel, spring means holding said housing assembly in normal extended position with respect to said gun barrel but permitting said housing assembly to be moved with respect to said gun barrel against the force of said spring means, a protecting pad on the forward end of said housing for engagement with said work surface, said pad extending about said gun barrel and normally positioned in a plane substantially perpendicular to the bore axis of said gun barrel, a flange on said housing end, a pad-carrying shield mounted on said flange, and resilient means supporting said pad in said shield, whereby said protecting pad will be held over the portion of said work surface surrounding said muzzle when said muzzle tip engages the work and said device is fired.



**2,773,260**
**GOGGLES**
Jack B. Hirschmann, Fairhaven, Mass.
Application September 25, 1953, Serial No. 382,327
5 Claims. (Cl. 2—14)

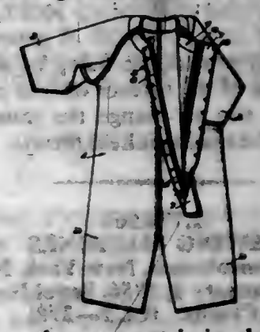
5. A goggle comprising a one-piece frame of flexible material including a front rim defining a single viewing aperture having portions for both eyes of the wearer connected by a portion of reduced vertical extent above the nose of the wearer, a one-piece lens of flexible material adapted to be received within said rim and of substantially complementary shape thereto including a recess in the lower edge thereof for overlying the nose of the wearer, a single continuous front flange on said rim proportioned to overhang and form a substantially continuous seat for the outer marginal strip on the front of said lens, said flange and said rim each including a saddle-like portion for entry in said nose recess in said lens, releasable fastener means mounted on the inside of said front flange and including a releasable fastener member carried by said saddle-like portion of said flange, complementary fastener means mounted in said marginal strip of said lens in position for engagement with said fastener means on said flange, said complementary fastener means including a fastener member located for engagement with said fastener member on said flange to secure said saddle-like portion of said rim within the complementary portion of said lens while providing for release of said lens from said frame by disconnection of said fastener means and deformation of said frame, said frame including a plurality of integral shoulder portions spaced with relation to each other around the inner periphery of said rim and spaced rearwardly with respect to said front flange for cooperation therewith to support said lens from the rear thereof, and releasable means connected with the ends of said frame for mounting said goggle on the head of the wearer.



**2,773,261**
**BRASSIERE**
Theo B. Schaumer, Los Angeles, Calif., assignor to Hollywood-Maxwell Co., Los Angeles, Calif., a corporation of California
Application November 14, 1955, Serial No. 546,432
3 Claims. (Cl. 2—42)

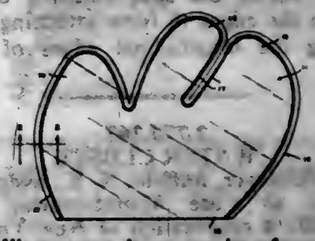
1. A brassiere comprising a body encircling member, a pair of breast cups in said member each having a depending essentially arcuate periphery portion, a pair of substantially crescent shaped breast supporters having essentially arcuate convex and concave edges, one supporter associated with each of said cups exteriorly thereof, said supporters being fixedly secured to the brassiere only along said depending peripheries of the cups by the convex edges of the supporters, with the concave edges thereof facing generally upwardly and being unattached to the cups, each supporter thereby overlying a portion of each cup with one end adjacent an inner portion of the respective cup and the other end adjacent an outer portion

of the respective cup, and a pair of shoulder straps each connected directly at one end to the outward portion only of a respective supporter and being otherwise unattached to said cups, said straps substantially forming continuations of both said edges of the supporters, said shoulder straps being joined at their other ends to the body encircling member.



**2,773,262**
**AIR VENTILATION HARNESS**
Lucien A. Brosius, Kennett Square, Pa., Paul E. Smith, Jr., Arden, Del., and John A. Zapp, Jr., Kennett Square, Pa., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application October 14, 1954, Serial No. 462,256
1 Claim. (Cl. 2—81)

An air ventilation harness adapted to be worn adjacent the body comprising an intercommunicating flexible tubing circuit consisting of a waist-encircling section, a pair of arm-receiving loops, a pair of arm feeder lengths and a pair of leg feeder lengths, all adapted for detachable individual attachment to the respective body members hereinabove identified, said tubing being provided with openings disposed in air-sweeping relationship at an angle in the range of about 10–15° to the surfaces of said respective body members, and said tubing circuit being provided with means for connection with a source of cool ventilating air maintained at superatmospheric pressure.



**2,773,263**
**CLOSURE FOR PROTECTIVE SUIT**
Dominic Pompa and Louis Cugini, Philadelphia, Pa., assignors to the United States of America as represented by the Secretary of the Army
Application February 21, 1955, Serial No. 489,812
1 Claim. (Cl. 2—96)
(Granted under Title 35, U. S. Code (1952), sec. 266)

In a supplemental closure for the front opening in a garment having zipper means for closing said opening, a flexible strip having one longitudinal edge secured to the garment at one side of the opening and another flexible strip having one longitudinal edge secured to the garment at the opposite side of the opening and both of said strips being substantially coextensive with the length of the opening, one of said strips being of sufficient width to have its free edge folded over the free edge of the

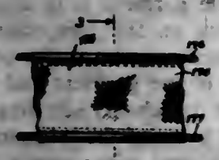
other strip when the garment is in closed position, complementary fasteners on the free edges of the strips to secure them in closed condition, and complementary fasteners on the body of the garment and on the exterior of the folded edge for detachably securing the supplemental closure against the body of the garment, said last-named fasteners being staggered with respect to the first-named fasteners.

**2,773,264**
**PROTECTIVE COVERING FOR THE HANDS**
Lewis E. Nover, Phoenix, Ariz.
Application June 9, 1953, Serial No. 360,416
2 Claims. (Cl. 2—159)

1. A glove-like protective covering for the hand of a wearer which will permit the free handling of comestibles for consumption, said covering being of greater width than length and comprising front and back identical portions produced from substantially thin fluid-proof, transparent and highly flexible sheet material, each of said portions having a relatively straight bottom edge, convex outer side edges and an upper edge formed with two spaced re-entrant portions of substantial depth so as to define a thumb receiving portion, an intermediate index finger receiving portion and an outer portion for receiving the remaining fingers of the hand, the thumb and outer portions being substantially of the same width and each being of greater width than the width of the intermediate portion, the peripheral edges of said front and back portions being substantially aligned and provided with a fluid-proof seal, said seal being inwardly spaced from said edges and following the peripheral contour of said front and back portions to provide a stiffening reinforcement of the same, said seal terminating at said straight bottom edge to provide an opening which extends substantially the full width of the glove-like covering to facilitate the placing of the covering on the hand.

**2,773,265**
**NON-SLIP BONING MATERIAL**
Franklin Dick, New York, N. Y., assignor to Richard A. Fisch, Long Island City, N. Y.
Application August 5, 1953, Serial No. 372,561
2 Claims. (Cl. 2—256)

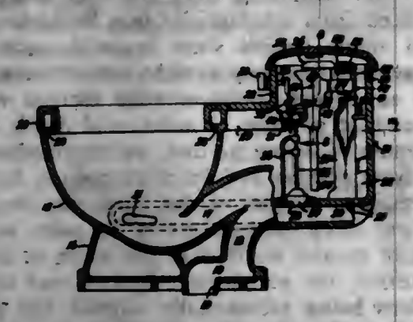
1. In combination a synthetic boning material comprising a longitudinal strip comprising two incompatible ther-



moplastic materials, said strip containing a multiplicity of roughening projections extending upwardly from substantially the entire flat surface regions thereof and a tape-like fabric jacketing the said strip, the depth and

spacing of the said projections being of a size sufficient to catch the surface of the threads of said jacketing fabric but of insufficient size to change the smoothness of the jacket itself when the boning is held therein.

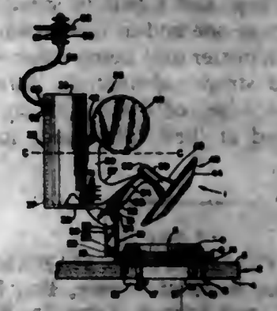
---



2,773,266
SEWING MACHINES
Max Blumenkrantz, New York, N. Y.
Application January 9, 1956, Serial No. 558,149
2 Claims. (Cl. 2—278)

1. As an article of manufacture, a double welted cushion boxing comprising a longitudinal strip of fabric material, the opposite edge portions of said longitudinal strip being folded about a pair of spaced apart substantially parallel cords and stitched to said longitudinal strip adjacent said cords, the said stitching being disposed inwardly from the edges to form attaching margins, said cords forming the longitudinal edges of said cushion boxing.

---



2,773,267
WATER CLOSET
George W. Kohlmeyer, Buffalo, N. Y., assignor, by mesne assignments, to Case Manufacturing Corporation, Robinson, Ill., a corporation of New York
Original application October 19, 1950, Serial No. 191,033. Divided and this application August 22, 1952, Serial No. 305,771
1 Claim. (Cl. 4—13)

In a water closet bowl having a flushing rim, a tank having a flush valve opening arranged below the upper level of said rim and communicating with the interior of said bowl and a flush valve normally closing said opening, the combination therewith of means for supplying water to said rim and also to said tank to form a body of flushing water therein, said means comprising a diverter valve having dual outlets, one of which supplies water to said rim and the other of which supplies water to said tank, the actuation of said flush and diverter valves being related, an imperforate dam wall arranged inwardly of the side wall of said tank to provide jointly therewith a vertically elongated channel which rises above the normal level of said water body and also above said rim, said channel being unfilled with water, a water supply pipe extending through said channel in spaced relation to the surrounding wall thereof and connected to the safe water supply system, a ball cock and an atmospheric vent valve arranged above said level and connecting the upper end of said pipe with the inlet of said diverter valve, whereby the water on the upstream side of said atmospheric vent valve is isolated from contact with water on the downstream side thereof and the likelihood of contamination of the safe water supply system is minimized.

---

2,773,268
FLUSH VALVE
Bohdan Hurko and Elbert P. Rohere, Louisville, Ky., assignors to American Radiator & Standard Sanitary Corporation, Pittsburgh, Pa., a corporation of Delaware
Application June 24, 1954, Serial No. 439,039
9 Claims. (Cl. 4—57)

2. In a flushing apparatus, a tank having an upward facing outlet, a valve member seatable on said outlet, a lever secured to said valve member, pivot means for said lever, a counterweight secured to said lever, means to decrease the weight of said counterweight, said counterweight being initially positioned to urge said valve member toward a closed position, actuating means operable to rotate said lever about said pivot means so that said counterweight urges said valve member toward an open position, said valve member being maintained in an open position until the weight of said counterweight decreases a predetermined amount thereupon said lever being operable to rotate about said pivot means and seat said valve member in a closed position.

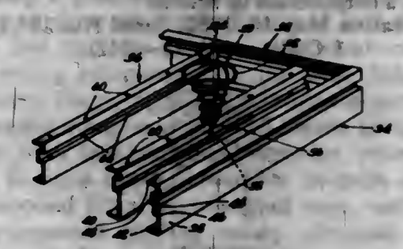
---

2,773,269
ROLL-A-WAY BED
William A. Holt, Mebane, N. C.
Application January 26, 1954, Serial No. 406,109
1 Claim. (Cl. 5—152)

A folding bed comprising a pair of upper frame members, a pair of upper horizontal stationary bars disposed between the inner ends of said members, means pivotally securing said frame members to the ends of said upper bars, a pair of vertical bars fixed one to each of said upper horizontal bars, a lower horizontal bar fixed to the lower end of each vertical bar, casters secured to the

outer ends of each lower bar, a pair of oppositely extending links pivotally connected at their inner ends to the outer ends of each lower bar, a pair of vertical outer end bars, a connecting bar fixed between each pair of said end bars, means pivotally securing the outer ends of said links to the lower ends of said outer end bars, a caster at the lower end of each outer end bar, means pivotally securing the upper ends of said outer end bars to said frame members, a pair of wheels rotatably carried by one pair of links, a common flexible sheet for said frame members, a wire fixed in the marginal edges of said sheet, a plurality of suspension springs secured between said frame members and said sheet, a substantially U-shaped latch bar fixed to the outer end of one frame member and formed with a keeper opening, and a latching pin carried by the outer end of the other frame member engageable with said keeper for holding said frame members in folded position.

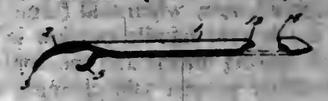
---



2,773,270
ADJUSTABLE INNERSPRING UNIT
Rexford A. Roselle, Chicago, Ill., assignor to Nachman Corporation, Chicago, Ill., a corporation of Illinois
Application September 13, 1952, Serial No. 309,438
19 Claims. (Cl. 5—253)

4. An adjustable innerspring unit of the class described comprising a plurality of coil springs each having convolutions of different degrees of resilience, shafts extending through said springs, bearing members supporting said shafts, each of said shafts having a plurality of offset portions, flexible means connecting the offset portions of the shafts, and means for moving said flexible means and shifting said shafts from inactive to active position, the offsets of said last-named shafts engaging and rendering rigid convolutions of coil springs through which said shafts extend.

---



2,773,271
FURNITURE STRUCTURE
Justin J. Wetzler, Evanston, Ill., assignor to The Englander Company, Inc., Chicago, Ill., a corporation of Delaware
Application November 8, 1954, Serial No. 467,263
10 Claims. (Cl. 5—264)

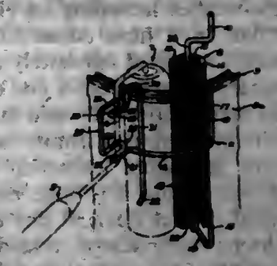
6. In a furniture structure, the combination comprising a frame including a pair of side frame members and a plurality of metal transverse frame members extending between and secured to said side frame members, each of said transverse frame members having a plurality of spaced superposed and integrally interconnected portions and a plurality of spaced sets of generally aligned aperture means in said frame portions, and a plurality of coil springs each disposed on one of said transverse frame members, each of said springs including a generally axially projecting wire section extending into one of said sets of aperture means, said transverse frame members including integral means defining portions of said aperture means and engaging said wire sections to restrain withdrawal of the wire sections from the aperture means.

---

2,773,272
COMBINATION CAN AND BOTTLE OPENER
George R. Harrah, Essex, Conn.
Application April 5, 1950, Serial No. 154,161
3 Claims. (Cl. 7—14.25)

1. A can opener comprising a unitary sheet metal blank shaped to form a cutting tip, a handle, and a hook for engaging under a bead of a can to act as a fulcrum for forcing the cutting tip into the top of the can, the handle and tip being arched in cross section reversely to each other, the tip being concave and the handle convex on the hook side of the opener.

---



2,773,273
BOAT HULL CONSTRUCTION
Theodore R. Drake, Long Beach, Calif.
Application January 16, 1953, Serial No. 331,525
1 Claim. (Cl. 9—6)

In a method for making a pattern for pieces of material for use in the construction of a boat hull portion having compound curved surfaces, comprising: placing a relatively thin and generally flat sheet of material on a boat hull form; conforming the sheet to the desired compound curved surface of said form; adjusting a rigid straight edge tool along the exposed surface of the sheet until contact is made all along said surface by the straight edge; scribing a line on said surface along said straight edge; pivoting said straight edge about a point on said line until contact is again made all along said hull by said straight edge and scribing a second line along said straight edge thereby making a V-shaped mark; similarly scribing a set of lines, each parallel to and spaced from the lines forming the V; and cutting the thin sheet of material along said lines in generally V-shaped parts.

---

2,773,274
CLEANING APPARATUS FOR PAINT APPLICATOR ROLLERS AND THE LIKE
James F. Beech, Battle Creek, Mich.
Application November 29, 1954, Serial No. 471,590
10 Claims. (Cl. 15—3)

1. In a cleaning device for a paint applicator of the type comprising an applicator roller, and a handle for

said roller having a lateral portion behind and spaced a short distance from the latter; a frame to engage the side wall of a can containing a solvent, a cleaning roller for vertical disposition in the can, said cleaning roller having an operating member at its upper end by means of which it may be rotated, bearing means mounting said cleaning roller on said frame, and additional bearing means on said frame positioned for disposition at the exterior of the can side wall to receive the lateral portion of the applicator handle when this lateral handle portion is positioned vertically; whereby when said frame is mounted on the can and the lateral handle portion is engaged with said additional bearing means and the applicator roller is positioned vertically against said cleaning roller, the applicator handle may be pivotally moved to press the applicator roller against said cleaning roller and the latter may be rotated, thereby rotating and cleaning the applicator roller.

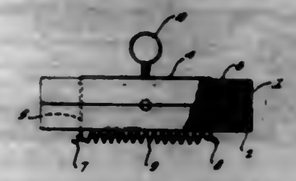
---

**2,773,275**
**BRUSH ASSEMBLY**
**Ruben O. Peterson, University Heights, Ohio, assignor to The Osborn Manufacturing Company, Cleveland, Ohio, a corporation of Ohio**
**Application November 10, 1950, Serial No. 195,011**
**3 Claims. (Cl. 15—77)**

3. A rotary brush comprising an arbor, a plurality of axially spaced annular discs of different diameters mounted thereon for rotation therewith, axially spaced sheet metal channel members secured to said discs and forming a series of circumferentially arranged alignments extending generally longitudinally of the brush assembly, said channel members opening radially outwardly and being axially spaced from one another in each such alignment, lengths of brush strip inserted in said channel members of such respective alignments, said brush strip comprising an elongated back portion with brush material of uniform length of trim retained therein and extending therefrom, and pins extending transversely through the side walls of said channel members and penetrating said brush material, said pins overlying the side edges of said back portions of said lengths of brush strip adapted to prevent escape of the latter from said channel members in use, the diameters of said respective discs being selected to afford the desired longitudinal contour of the brush.

---

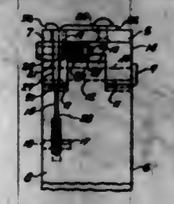
**2,773,276**
**LOUVER WINDOW-WASHER**
**Adolph G. Pape, Topeka, Kans.**
**Application June 9, 1954, Serial No. 435,499**
**1 Claim. (Cl. 15—130)**



A louver window-washer including an elongated fluid-supplying tubular handle, a hose connection at one end of said tubular handle, a pair of oppositely disposed tubular extension loops carried by the other end of said handle, each loop being in connection with said tubular handle, said loops being in parallel conformity and in spaced relation and having scrubbing elements thereon, each scrubbing element comprising a sponge member having an interiorly-extended pocket open at one end only, said tubular extension loops being seated in said pockets, said sponge members being of rectangular configuration and having opposed contacting flat surfaces to provide maximum opposed confronting cleaning surfaces adapted simultaneously to clean opposite surfaces of a louver, and fluid exit openings in each tubular extension loop contact-

ing a surface of said sponge member to provide a maximum fluid distribution therethrough.

---

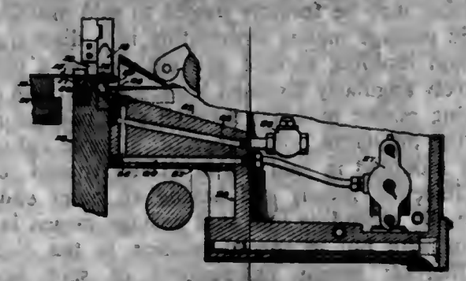


**2,773,277**
**OIL DIP STICK WIPER**
**Raymond A. Souter, Bellflower, Calif.**
**Application January 16, 1956, Serial No. 559,158**
**1 Claim. (Cl. 15—210)**

An oil dip stick wiper comprising a pair of pads, said pads being formed of a nonmetallic, flexible and oil absorbent material, one of the surfaces of said pads bearing against a like surface of the adjacent pad, a metallic clip securing said pads in juxtaposition, said clip being formed with a finger at each end thereof, said fingers extending transversely through said pads and one end of the fingers projecting beyond a pad, a loop formed on said clip between said fingers, and a coil spring attached at each end to the projecting ends of the fingers, said coil spring bearing against one of said pads throughout the length of said spring.

---

**2,773,278**
**AUTOMOBILE DOOR HINGE EMBODYING HOLD-OPEN MEANS**
**Seth B. Atwood and Agnar Johnson, Rockford, Ill., assignors to Atwood Vacuum Machine Company, Rockford, Ill., a corporation of Illinois**
**Application May 10, 1952, Serial No. 287,168**
**1 Claim. (Cl. 16—141)**

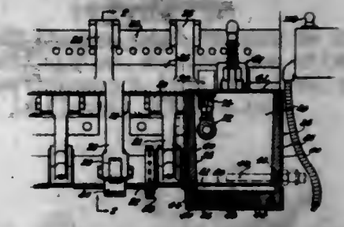


A hinge for a vehicle door comprising first and second elongated hinge members connected together at one end for relative pivotal movement through a predetermined angle, one of said hinge members being adapted to be mounted on a body pillar of the vehicle and the other adapted to be mounted on and for movement with the door pillar, said hinge members being disposed in side-by-side relation in the closed position of the door, an elongated longitudinally slotted link pivotally connected at one end to said first hinge member in radially spaced relation to the hinge axis, said second hinge member

being provided with a slot in radially spaced relation to the hinge axis, said link passing through said slot, a projection on said second hinge member extending parallel with said link and adjacent one side thereof at the slot through which said link passes, a bolt extending through an aperture in said projection and passing through the slot in said link, a friction drag plate on said bolt abuttting said link at the side away from said projection, spring means on said bolt having one end thereof bearing against said projection and the opposite end reacting against a nut on said bolt and urging said bolt axially in the direction to cause said drag plate to frictionally resist sliding movement of said link between said drag plate and projection, a flat portion on said nut slidably engaging said second hinge member to prevent the nut from turning with the bolt, the end portion of said link opposite the pivotally connected end being relatively thick to effect a comparatively high degree of friction drag on said link when the movable one of said hinge members has been moved away from the other hinge member to a position corresponding to the open position of the door thereby retaining said movable hinge member and door in the open position, the remaining longitudinal portion of said link being relatively thinner thereby to effect a comparatively much lower degree of friction drag thereon exerted by said drag plate and projection for movement of said movable hinge member and door between the closed and open position.

---

**2,773,279**
**APPARATUS AND METHOD FOR APPLYING SIDE SEAM SEALING COMPOUND TO CAN BODY BLANKS**
**Edwin L. Albright, Glenview, Ill., assignor to Continental Can Company, New York, N. Y., a corporation of New York**
**Application July 15, 1955, Serial No. 522,281**
**20 Claims. (Cl. 18—1)**



1. An apparatus for applying side seam sealing compound to a can body blank of a type having a hook flange joined by a bight to the contiguous portion of the blank; said apparatus comprising means for feeding the blank along a predetermined path with the hook flange of the blank disposed longitudinally of said path, means adjacent said path for directing an overabundant quantity of sealing compound into the zone defined jointly by the hook flange, bight and contiguous portion of the blank, sealing compound plowing means advanced along said path from said compound directing means and constructed to plow out a substantial quantity of the surplus compound from the aforesaid zone, and additional sealing compound plowing means advanced along said path from the first mentioned plowing means and constructed to plow out the remainder of the surplus sealing compound.

18. A method of applying side seam sealing compound to can body blanks each having a hook flange joined by a bight to the contiguous portion of the blank; said method comprising the steps of feeding the blanks along a predetermined path with their hook flanges disposed longitudinally of said path, at one point on said path injecting an overabundant quantity of sealing compound into the zone defined by the hook flange, bight and contiguous portion of each blank, at a more advanced point on said path plowing out substantially half of the surplus compound from the aforesaid zone, and at a still further advanced point on said path plowing out the remainder of the surplus compound from said zone and troweling the compound left on said hook flange, bight and contiguous portion of the blank.

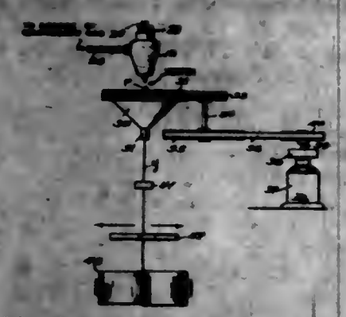
**2,773,280**
**CONTAINER SIDE SEAM SEALING COMPOUND APPLYING APPARATUS AND METHOD**
**Edwin L. Albright, Glenview, and Philip F. Catalano, Chicago, Ill., assignors to Continental Can Company, Inc., New York, N. Y., a corporation of New York**
**Application July 13, 1954, Serial No. 443,022**
**21 Claims. (Cl. 18—1)**

1. In apparatus of the character described, a sealing compound distributing plow, means for placing a can body blank with a longitudinal seam hook thereon having a sealing compound applied therein in accurate cooperative relation to said plow for having the plow engage the sealing compound within the hook, and means for bringing about relative movement along a straight line between said plow and said hook with the plow extending into and engaging in the hook while said accurate cooperative relation is maintained for causing the plow to distribute the sealing compound evenly throughout the whole length of the hook.

---

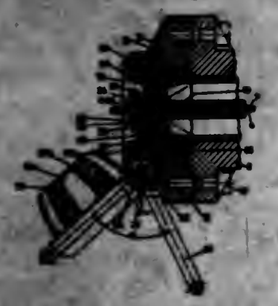
**2,773,281**
**METHOD AND APPARATUS FOR SPINNING HIGH STRENGTH SILK FROM CUPRAMMONIUM CELLULOSE SOLUTIONS**
**Viktor Ehrenner, Leverkusen, Germany, assignor to J. P. Bemberg Aktiengesellschaft, Wuppertal-Oberbarmen, Germany, a joint-stock company of Germany**
**Application April 7, 1953, Serial No. 347,208**
**2 Claims. (Cl. 18—8)**



1. The method of producing filaments of high tensile strength from cuprammonium cellulose solutions which comprises passing the filaments into a funnel shaped bath, allowing the filaments to partially coagulate in said bath so that at the end of the bath the filaments have an optimum viscosity of 50,000 to 60,000 poises, passing the filaments into a second bath, subjecting the filaments to the action of braking means for the filaments so as to increase the length of travel and uniformly apply stretching tension, and drawing off the filaments at the end of the second bath at more than twice the speed of the filaments at optimum viscosity whereby the filaments have been stretched to less than half their section at the point of optimum viscosity, the length of filament path in said second bath and the drawing off velocity being such

that the time of filament passage from the point of optimum viscosity through the second bath is at least 0.6 second.

---



2,773,282
**METHOD OF AND APPARATUS FOR SPINNING YARNS**
Stanley Backer, Cambridge, Mass.
Application January 17, 1950, Serial No. 139,110
5 Claims. (Cl. 18—9)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In combination, a nozzle having a connection with a supply of compressed gas and having a fluent material inlet and a discharge end and constructed and arranged to deliver a whirling blast of the gas flowing at supersonic velocity to a point outside of said discharge end so that the fluent material is disrupted at said point; a rotatable filament-collecting and yarn-forming member located just below said point and having a surface adapted to receive all the filaments formed by the action of the nozzle, said member having means mounted on its filament-receiving surface and engaging all the filaments so received and twisting them into a yarn, and an exit tube fixed to and extending out from the center of said member and receiving and discharging said yarn, said member being in the form of a funnel with flutes fixed to and upstanding from the upper frusto-conical face of the funnel, said flutes being spaced at their inner ends from the entrance to the exit tube and being arranged substantially radially relative to the axis of the exit tube.

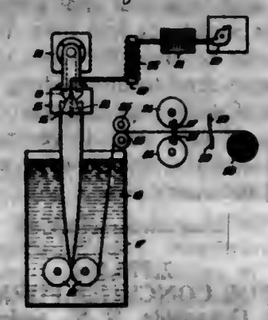
2,773,283
**HYDRAULIC PRESS FOR PRODUCING COATED ELECTRODE RODS**
Georges Maisonneuf and Max Rubli, Zurich, Switzerland, assignors to Holding Intercito S. A., Zurich-Oerlikon, Switzerland, a company of Panama
Application August 7, 1951, Serial No. 240,740
Claims priority, application Switzerland August 9, 1950
1 Claim. (Cl. 18—13)

A hydraulic press for the manufacture of coated electrode rods, said press comprising, in combination, a pressure cylinder, an extruding cylinder extending coaxially with said pressure cylinder and having a rear end connected with said pressure cylinder and an open front end, a common piston rod for both cylinders, said piston rod having an axial bore formed therein for the core wire, a flange ring upon the front end of said extruding cylinder and having formed thereon sections of spherical threads and grooves between said sections, a cover cap having sections of spherical threads adapted to mesh with the spherical thread sections of the flange ring and being at most as large as said grooves, whereby a rotation of said cover cap will engage said cap with said flange ring and will interrupt this engagement, a pin rotatably mounted in said flange ring transversely to the direction of said cylinders, a ring rotatably supporting said cover cap and said ring and having a slot formed therein, a worm gear segment connected with said cover cap and freely movable to a limited extent in said slot, a worm keyed upon said pin and meshing with said worm gear segment, and a hand lever swingable with said pin, whereby an initial swinging of said hand lever will turn said cover cap to unlock the same, whereupon said cover cap is swingable along with said lever.

---

2,773,284
**DIE CONSTRUCTION FOR PRESSURE INJECTION MOLDING MACHINES**
George W. Kelly, Columbus, Ohio, assignor to Columbus Plastic Products, Inc., Columbus, Ohio, a corporation of Ohio
Application March 13, 1953, Serial No. 342,169
2 Claims. (Cl. 18—30)



1. In an injection molding machine; a die having a molding surface and passage means through which plastic materials may be forcibly passed to said molding surface; said passage means terminating in a discharge orifice at said molding surface and embodying a plurality of relatively angularly disposed branches; injection means for forcing plastic material through said passage means toward the discharge orifice thereof; a sprue cut-off pin movably mounted in said die in axially spaced relation to said injection means and having an outer end, said pin normally extending into said passage means in axial alignment with but in spaced relation to the discharge orifice thereof; means independent of said injection means for moving said pin in the general direction of flow of plastic material toward said discharge orifice and to a position at which said pin closes the orifice of said passage means and is disposed in substantially flush relation to said molding surface; said pin-moving means embodying a lever pivotally mounted on said die and connected at one end with said sprue cut-off pin for moving the same between positions of orifice opening and closure; a cylinder mounted on and disposed exteriorly of said die; a fluid-actuated piston slidably mounted in said cylinder, said piston carrying a rigid rod that extends exteriorly of the cylinder; and means articulately joining the rod at its outer end with said lever.

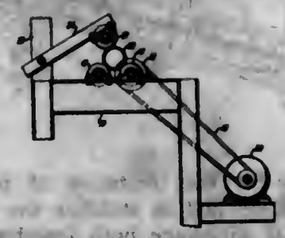
---

2,773,285
**METHOD OF MAKING STERILE CONTAINERS**
Thomas E. Pierce and Thomas E. Baxter, Mount Vernon, Ohio, assignors, by mesne assignments, to Continental Can Company, Inc., New York, N. Y., a corporation of New York
Application November 6, 1947, Serial No. 784,430
2 Claims. (Cl. 18—47.5)

1. A continuous process of forming sterile containers comprising extruding a thermoplastic material in the form of a hollow tubular body, supplying a fluid medium within the tubular body which is heated to a temperature sufficient for sterilization, maintaining the interior of the tubular body in sterile condition, flattening the tubular body and thereby removing the fluid medium from the tubular body, and transversely sealing the tubular body

at spaced intervals while maintaining the interior thereof in sterile condition to provide a plurality of integrally connected containers which are adapted to remain free from internal contamination until they are individually severed.

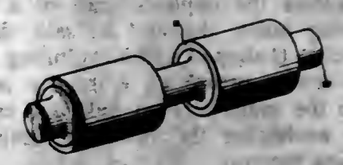
---



2,773,286
**PROCESS OF FORMING NON-WOVEN POROUS FIBROUS SYNTHETIC LEATHER SHEET**
John Augustus Piccard, Swarthmore, Pa., and Boynton Graham, Claymont, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 29, 1952, Serial No. 301,603
5 Claims. (Cl. 18—48)

1. The process of forming non-woven porous fibrous sheet which comprises forming a non-woven fibrous sheet comprising essentially structural fibers from the group consisting of staple fibers of synthetic linear polyamide, polyethylene terephthalate, polymers of acrylonitrile, polyvinyl acetals, regenerated cellulose, cotton and wool, from 40% to 70% by volume based on the total volume of the sheet, of pore-forming fibers selected from the group consisting of polyvinyl alcohol, cellulose acetate, sodium alginate and carboxymethyl cellulose, and a soft elastomeric binder material having a flow temperature below the deformation temperature of said fibers, the weight ratio of structural fibers to binder material being within the range of from 1:2 to 2:1, hot pressing said sheet at a temperature above the flow temperature of the binder and below the deformation temperature of said fibers, and thereafter extracting said pore-forming fibers from the sheet with a liquid which is a solvent for said pore-forming fibers and a non-solvent for said structural fibers and binder material whereby said structural fibers are substantially uniformly distributed throughout said porous sheet.

---



2,773,287
**METHOD OF MANUFACTURING PLASTIC PIPE**
William H. Stout, Portland, Oreg.
Application July 14, 1952, Serial No. 298,690
4 Claims. (Cl. 18—58.3)

1. A method of forming high strength plastic pipe which comprises disposing a mat of glass fiber against and around the inner surface of a tubular member, rotating said member about its longitudinal axis, successively depositing within said rotating member a quantity of thermosetting resin and a quantity of relatively dense granular sand-like materials of specific gravity higher than that of said resin whereby to exert pressure on said fibers during rotation while said resin infiltrates between and around said fibers and coats said granular material, and thereafter subjecting said resin to heat to effect the thermosetting thereof while continuously rotating said member, whereby a high strength plastic pipe is obtained characterized in structure by an outer portion enriched in said glass fibers substantially dispersed as a plurality of layers through said resin, and an inner portion enriched in said granular sand-like material.

---

2,773,288
**TEXTILE COT**
Joseph Rockoff, Dayton, Ohio, assignor to The Dayton Rubber Company, a corporation of Ohio
Application February 9, 1952, Serial No. 270,805
6 Claims. (Cl. 19—143)

1. A textile fiber drafting cot having a working surface made of an oil-resistant synthetic rubber-like material as the essential constituent and having intimately incorporated therewith discrete particles of polyvinyl alcohol to effect modification of the drafting properties thereof, the particles which are exposed at the surface of the cot being minutely swollen by the absorption of moisture to provide a fiber-working surface having such swollen particles embedded in the oil-resistant rubber-like material.

---

2,773,289
**HIGH FREQUENCY WINDOW STRUCTURE**
Stuart T. Martin, Dedham, and Marshall C. Pease, Needham, Mass., assignors to Sylvania Electric Products Inc., a corporation of Massachusetts
Application May 6, 1949, Serial No. 91,728
5 Claims. (Cl. 20—40)

1. A window having a substantially flat rectangular metal frame, an apertured central metal panel, a glass closure sealed to the edges of the aperture, and an oval yielding connection between said frame and said panel.

---

2,773,290
**FOUNDRY FLASK CONSTRUCTION**
William G. Reichert, Newark, N. J.
Application August 13, 1954, Serial No. 449,653
15 Claims. (Cl. 22—101)

6. In combination, a flask section having an end wall formed with a notch in an edge thereof, a pattern plate secured to said flask section, and a cover plate secured to one end of the pattern plate and aligned with said end wall notch and received in and closing the latter to prevent sand flowing therethrough.

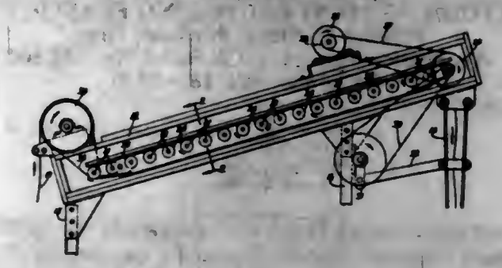
2,773,291
BALE TIE
Frank A. Teeple, Jr., Atlanta, Ga., assignor to Atlantic Steel Company, Atlanta, Ga., a corporation of Delaware
Application June 10, 1954, Serial No. 435,797
2 Claims. (Cl. 24—26)

1. A fastening device of the character described for bale bands having fastening holes at their ends, comprising a one-piece rigid rod-like member having a neck, a shank integral at one end with and extending sidewise from one end of said neck, and an end portion extending at a slant from the opposite end of said neck, said neck and slanting end constituting a hook adapted to hook together the opposite ends of a bale band at their fastening holes, the end of said shank opposite said neck being U-shaped and constituting a handle and having a sidewise projecting extremity adapted to be pressed into the material of a bale and constituting an anchor for anchoring the fastening device to a bale against turning thereon.

2,773,292
PIN STEM FINDING
Alfred E. Sauer, Warwick, R. I., assignor to B. A. Ballou & Co., Incorporated, a corporation of Rhode Island
Application January 7, 1954, Serial No. 402,782
3 Claims. (Cl. 24—157)

1. A pin stem finding comprising ears secured together at their lower extremity and spaced to provide a slot between them, said ears having an anchor portion adjacent their lower extremity for mounting in a molded article and a barrier extending across said slot at a location above the point of connection of said ears together to block the molded material of said article flowing upwardly in said slot.

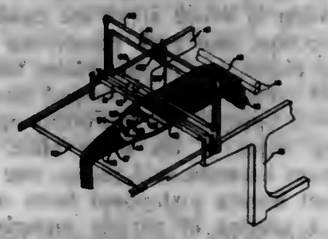
2,773,293
EAR CLIP
John R. Watson, Bristol, R. I., assignor to B. A. Ballou & Co., Incorporated, a corporation of Rhode Island
Application June 18, 1954, Serial No. 437,628
8 Claims. (Cl. 24—252)



1. An ear clip comprising a U-shaped member one leg of which forms a relatively stationary ear lobe engaging jaw and the other leg of which has spaced openings at the terminal end thereof and a cam surface adjacent each of said openings inwardly thereof converging toward the bridge portion between said legs, an ear lobe clamping jaw having a pair of resilient arms with the terminal ends thereof extending in the space between said openings into engagement with said cam surfaces and each having an outwardly projecting trunnion pivotally received in one of said openings to mount said clamping jaw to swing in the space between said legs, said cam surfaces being spaced from each other a distance less than the normal spacing between said arms to press the same toward each other whereby said arms tend to move along said cam surface in the direction of widest spacing thereof in consequence of the tendency of said arms to recover to the normal spacing thereof and thereby to swing said clamping jaw toward the said stationary jaw.

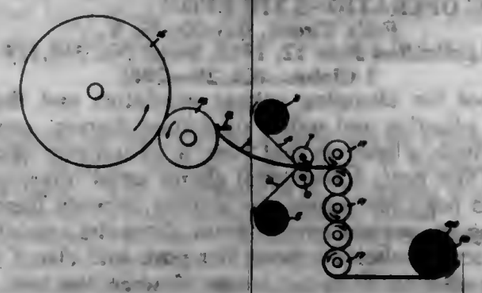
2,773,294
CLAMPS FOR CONCRETE FORM TIE RODS
Alan H. Pilling, Oceanside, N. Y., assignor to Richmond Screw Anchor Company, Inc., New York, N. Y., a corporation of New York
Application December 6, 1954, Serial No. 473,119
7 Claims. (Cl. 25—131)

6. A clamp for fitment on a ribbed concrete reinforcing bar comprising, a pair of similarly-shaped arcuate, semi-cylindrical segments co-operating to form a cylinder when placed together, a concrete reinforcing bar placed between the segments and grippingly engaged thereby and held against longitudinal movement through the cylinder formed by the segments, the bar being provided with a plurality of separate, spaced-apart annular ribs, the interior surface of each segment having separate, spaced-apart grooves for closely fitting over the ribs and holding the bar against longitudinal movement, the arrangement of ribs and co-operating grooves being such as to prevent entry of the bar between the segments or its removal from between the segments except when the segments are in separated relationship, the outer surfaces of the segments being provided with screw threads, and an adjusting member in the form of spaced rods provided with a rigid helix secured between them and having said rigid helix disposed in threadable engagement with said threads.

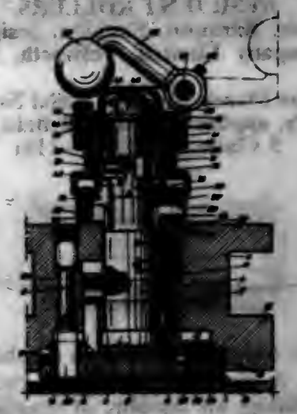


2,773,295
APPARATUS AND METHOD FOR TREATMENT OF TEXTILE FABRICS
Donald C. Glassford, Philadelphia, and Frank R. Redman, Yardley, Pa.; said Glassford assignor to Proctor & Schwartz, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application March 25, 1953, Serial No. 344,582
12 Claims. (Cl. 26—18.5)

1. Apparatus for the treatment of textile fabric to minimize shrinkage and to stabilize the fabric with respect to residual shrinkage both lengthwise and widthwise, comprising a treatment chamber having an inlet to receive the fabric and an outlet spaced from the inlet to discharge the fabric after treatment, a plurality of successive fabric-supporting rotatable members arranged in a row the full distance between said inlet and said outlet, said members extending transversely within said chamber and being closely spaced relative to one another lengthwise of the chamber, said members being identical with one another in shape and size and being of uniform cross-section throughout their length to support the fabric at a plurality of longitudinally-spaced narrow areas extending continuously the full width of the fabric, the fabric being completely free in the spaces between said areas, means for rotating said members in the same direction and at the same angular speed to effect movement of the fabric from said inlet to said outlet at a substantially constant rate, and to effect substantially uniform wave-like flexing motion of the fabric throughout the entire distance between said inlet and said outlet, whereby to effect working of the yarns and fibers of the fabric in relaxed condition, and means for applying steam to the fabric while it is being worked.

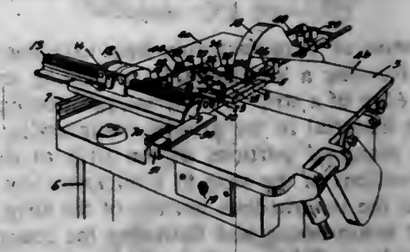


2,773,296
FABRIC CONTROL APPARATUS
Samuel Cohn and Eugene Cohn, New York, and Jules G. Walter, Manhasset, N. Y., assignors to Samcoe Holding Corporation, Woodside, N. Y., a corporation of New York
Application June 5, 1953, Serial No. 359,875
19 Claims. (Cl. 26—55)



1. In combination with a device for spreading a tubular textile fabric to flattened form as it is advanced thereover, a rotatable member supported by said device for rotation in a plane substantially normal to the plane of the flattened fabric and adapted to lie within the tubular fabric passed over said spreader to engage one layer thereof, the fabric engageable surface of said rotatable member lying a substantial distance from the plane in which said one layer of fabric is normally disposed by said spreading device whereby the tubular fabric is distended substantially in two directions in passage over said spreading device and said rotatable member, and means to adjust said rotatable member to change the angle of its plane of rotation relative to the direction of advance of said tubular fabric.

2,773,297
PROCESS AND APPARATUS FOR MAKING YARN AND FABRIC
Louis M. Cotchett, Whitman, Mass.
Application August 30, 1951, Serial No. 244,409
8 Claims. (Cl. 28—1)



1. Apparatus for making sheet material containing vegetable fibers comprising in combination a carding machine producing a thin fleece of such fibers, means supplying thermoplastic material in sheet form, rolls feeding the fleece between two sheets of thermoplastic material, and means for melting the thermoplastic and combining the fleece and sheets into a single composite sheet thus embedding all the fibers in the thermoplastic material in their original relation as received from the carding machine.

2,773,298
VERTICALLY ADJUSTABLE TURRETS FOR MACHINE TOOLS
Henri René Bruet, Paris, France, assignor to Societe Anonyme dite: "Etablissements Carnoeuve," La Plaine Saint-Denis, France, a French company
Application March 1, 1955, Serial No. 491,411
Claims priority, application France March 20, 1954
7 Claims. (Cl. 29—35.5)

1. A rotary turret for machine tools, comprising a stationary base, an upright fixedly connected to said base, a socket slidingly mounted on said upright and having the lower end thereof provided with a frusto-conical surface, an angularly adjustable body coaxial with said socket and having the lower end thereof provided with a frusto-conical surface the angle of which is equal to that of the first-mentioned frusto-conical surface and facing the opposite direction with reference to the axis of said upright, radially sliding members having their opposite ends bevelled for engaging the frusto-conical ends of said socket and of said angularly adjustable body respectively, means for adjusting the axial longitudinal location of said angularly adjustable body with reference to said socket and means engaging said upright for locking said socket and said angularly adjustable body.

2,773,299
SHELL HIGH TRIMMING ATTACHMENT
Robert J. Mack, Plainview, Minn.
Application July 21, 1952, Serial No. 300,048
5 Claims. (Cl. 29—67)

1. In a printer's material-trimming saw comprising a worktable, a driven saw blade, a workholding clamp and a gauge frame including a measuring bar and a finger; an attachment for holding a slug of type, whereby said slug may be accurately trimmed in height by said saw blade; said attachment comprising a base provided with a plurality of adjustable screw members extending outwardly from said base on a plane parallel thereto, a top clamp member mounted over said base for vise-like co-

operation therewith, and means for advancing and retracting said top clamp member toward and away from said base whereby portions of said base and clamp member will provide opposed gripping jaws; said base and top clamp member being mounted on said worktable with one of said adjustable screw members in abuttment against said measuring bar, a second of said adjustable screw members in abuttment against said finger, and said gripping jaws extending at right angles to the axis of rotation of said driven saw blade, said attachment being provided with a member for holding said attachment against said finger, said attachment being maintained in position on said worktable by said workholding clamp.

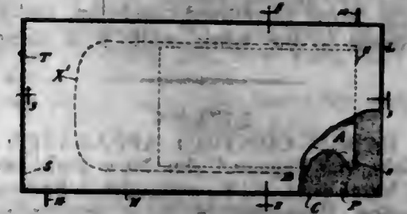
**2,773,300**
**RESILIENT ROLLERS**
**Henry Clements, Surbiton, England, assignor to Andre Rubber Company Limited, Tolworth, Surbiton, England**
**Application March 30, 1953, Serial No. 345,315**
**Claims priority, application Great Britain July 24, 1952**
**5 Claims. (Cl. 29—116)**

1. A resilient roller comprising in combination a cylindrical spindle, a plurality of smooth-bored cylindrical units each including an annulus of elastomeric material assembled in juxtaposition on said spindle, said units when so assembled forming annular open end receptacles for lubricant with said open end facing the periphery of said spindle, and means for axially compressing said units together detachably mounted on and connected to said spindle, each said unit having two faces lying in planes normal to the axis of the unit and having formed in one of said faces at least one circumferential groove and in the other of said faces at least one complementary circumferential rib engaging with the respective circumferential groove of an adjacent unit.

---



**2,773,301**
**METHOD OF MAKING HEAT EXCHANGE UNIT**
**John Karnazin, Grosse Ile, Mich.**
**Application November 21, 1950, Serial No. 196,889**
**1 Claim. (Cl. 29—157.3)**

The method of manufacturing heat exchangers which comprises forming a longitudinally extending groove adjacent one edge of a strip of material, positioning a length of bonding material in the groove, compressing and flattening the marginal portions of the strip to reduce the marginal portions of the strip to a thickness less than the thickness of the intermediate portion of the strip, utilizing the step of compressing and flattening the marginal portions to simultaneously securely embed and condense all of the bonding material entirely within the confines of the groove, forming the strip into tube formation with the reduced marginal portions in overlapping contacting relationship so as to form a longitudinally extending seam, cutting the tube thus formed into relatively short sections, passing the short sections of tubing through aligned openings provided in a series of spaced fins, applying heat to the assembly only for a sufficient time to fuse and expand the bonding material to cause enough flow thereof into the seams of the tubes and onto the outer surfaces of the tubes so as to properly braze the seams and bond the fins to the tubes, and thereafter cooling the assembly so as to prevent further flow of bonding material.

---

**2,773,302**
**PACK FOR MAKING ROLLED ALUMINUM CLAD PLATE**
**Thomas T. Watson, Coatesville, Pa., assignor to Lukens Steel Company, Coatesville, Pa., a corporation of Pennsylvania**
**Application June 21, 1951, Serial No. 232,818**
**3 Claims. (Cl. 29—196.2)**

1. A pack for making rolled aluminum clad plate, said pack being rectangular in shape and having a leading edge and a trailing edge considered with relation to a rolling operation in which all of the passes are made in the same direction, said pack comprising a pair of rectangular steel plates, one of said plates being larger than the other and symmetrically arranged thereover with its edges extending beyond and uniformly spaced from the corresponding edges of the other plate, a rectangular aluminum sheet between said plates, one of said plates and said sheet having juxtaposed faces in contact with each other, a coating of parting material between the other face of said sheet and the adjacent face of the other plate to prevent bonding of said sheet to the other plate, said plates forming the outside layers of said pack and said sheet having an area substantially less than the area of either of said plates and having its edges spaced inwardly from the edges of said plates, said sheet being nearer the leading edge of said pack than the trailing edge to form a relatively large space between said sheet and the trailing edge of said pack to receive a substantial portion of said sheet as it is extended thereinto under the pressure of a rolling operation, the corners of said sheet adjacent the leading edge of said pack being tack welded to the larger plate to prevent bodily shifting of said sheet with respect to said plates, the portions of said plates adjacent the sides of leading edge of said pack being inclined toward and into contact with each other, and a continuous weld hermetically sealing the edges of said plates.

**2,773,303**
**TOOL FOR CLAMPING VOLTAGE REGULATORS AND THE LIKE DURING ADJUSTING AND SETTING OPERATIONS THEREON**
**Felix Throne, Bayside, N. Y.**
**Application June 12, 1953, Serial No. 361,129**
**1 Claim. (Cl. 29—286)**

A tool for clamping voltage regulators and the like during adjusting and setting operations thereon, comprising: a base, a post on said base, a second post disposed on the first post, a horizontal clamp screw interconnecting said posts and serving as a pivot between them and enabling the second post to pivot about the axis of said clamp screw relative to said first post, said clamp screw serving also as clamping means between the two posts to clamp the second post in selected fixed positions relative to the first post, a bracket rotatably mounted on the second post for rotary movement about the longitudinal axis of said second post, a set screw interengaging said bracket with said second post to lock said bracket in

selected fixed positions relative to said second post about its longitudinal axis, a platform mounted on said bracket, a pair of bearings on said platform, an upright frame mounted on said bearings for pivotal movement about an axis which is situated adjacent the platform and parallel thereto, a clamp screw comprising one of said bearings and adapted to clamp said upright frame in selected fixed positions about said last mentioned axis, a pair of spaced parallel guide tracks supported on said upright frame in perpendicular relation thereto, a pair of carriages slidably mounted on said guide tracks, a pair of guide rods mounted on said carriages in spaced parallel relation to each other, laterally of said guide tracks, a plurality of slides mounted on said guide rods for movement along said guide rods toward and away from each other, adjusting screws in said slides which are adjustable relative to said slides toward and away from the platform, and inverted U-shaped yokes swivelly mounted on said adjusting screws for engagement with a voltage regulator mounted on said platform.

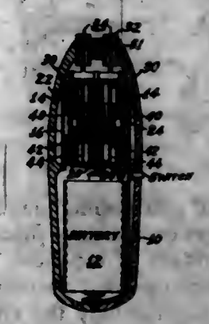
**2,773,305**
**METHOD OF PRODUCING PIN STEM FINDINGS**
**John R. Watson, Bristol, and Rogers T. Stafford, East Providence, R. I., assignors to B. A. Dallou & Co., Incorporated, a corporation of Rhode Island**
**Application November 18, 1953, Serial No. 392,898**
**6 Claims. (Cl. 29—558)**



1. The method of producing a pin stem finding which comprises the steps of turning rod stock to form a finding body having a bulbous portion symmetrically disposed about the axis of the rod, drilling a hole in the bulbous portion at right angles to said axis partially through the bulbous portion and beyond said axis of a size so as to leave a substantial circular margin of the bulbous shape about the opening, slotting the bulbous portion along

said axis at right angles to the axis of said bore and across said opening.

**2,773,306**
**ELECTRICAL RAZOR**
**Harry Leo Ranson, New York, N. Y.**
**Application December 6, 1951, Serial No. 260,147**
**5 Claims. (Cl. 30—43)**

4. An electric shaver comprising a pair of parallelly arranged coextensive shaving heads arranged side-by-side each of which has adjacent thereto a movable shaving cutter capable of reciprocating motion in a plane, a motor including an armature having a substantially circular core whose diameter is greater than the length of its longitudinal axis, commutators symmetrically mounted on opposite sides of said core, a spindle for said armature extending through the centers of and beyond said commutators, eccentrics mounted on said spindle and disposed on opposite sides of and equally distant from said armature, said eccentrics being mounted 180 degrees out-of-phase with respect to each other, and straight levers between said eccentrics and said cutters for translating the motion of said eccentrics to reciprocating motion of the cutters in a plane for causing said cutters to travel simultaneously in opposite directions and always at an 180 degree out-of-phase relation.

---

**2,773,307**
**STRAP CUTTER**
**Hollinshead T. Martin, Evanston, Ill., assignor to Signode Steel Strapping Company, Chicago, Ill., a corporation of Delaware**
**Application February 28, 1955, Serial No. 490,733**
**9 Claims. (Cl. 30—194)**

1. A strap cutter including in combination, oppositely rockable plate-like cutting elements having spaced inner faces and cutting edges, a third plate-like cutting element arranged in the space between said first named cutting elements and slidable rectilinearly across and in contact with said spaced inner faces, said third cutting element having cutting edges cooperable with and movable past

said cutting edges on said first named elements, and operable means connected to all said cutting elements for actuating the same, whereby movement of all said cutting edges in strap cutting direction will shear the strap in parallel and overlapping cuts offset a distance equal to the thickness of said third cutting element.

**2,773,308**
**METHOD AND APPARATUS FOR ADAPTING DENTURES**
Carl P. Van Court, North Hollywood, Harold E. Kinsman, Beverly Hills, and Clawson N. Skinner, Whittier, Calif.
Application March 2, 1953, Serial No. 339,706
11 Claims. (Cl. 32—19)

1. The method of establishing mandibular relationships for adapting dentures comprising: placing impression trays over the alveolar ridges of a patient, inserting quick-setting material between opposed portions of said trays, uniformly subjecting substantially the entire area of the remaining opposing portions of said trays to a pressure substantially equal to the physiologic pressure corresponding to the diastolic cardio-vascular pressure characteristic of the patient, and maintaining said pressure until the quick-setting material has hardened.

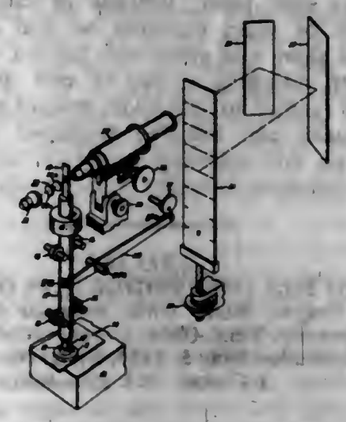
---

**2,773,309**
**BORE SIGHTING DEVICE FOR FIREARMS**
Raymond St. C. Elliott, Seattle, Wash.
Application June 27, 1955, Serial No. 518,003
9 Claims. (Cl. 33—46)

1. A bore sighting device for use in the chamber of hand firearms, comprising: an elongated and hollow cartridge-shaped body having a cylindrical end or neck portion, and a conical shoulder portion adjoining said neck portion adapted to coact with the firearm shoulder cone to center the forward portion of the body in the rifle bore; said body having corresponding diameters less than the cartridge adapted for use in said chamber; resilient centering means at the rear portion of said body adapted to engage the chamber walls to center the rear portion in the chamber; said body having forward and rear center indicating mechanical sighting means in its interior aligned with the axis of said body and said body having axial openings at the front and rear thereof for sighting therethrough at a target.

---

**2,773,310**
**TELESCOPE SIGHT MOUNT**
Ernest Bircher, Palouse, Wash.
Application May 26, 1952, Serial No. 290,043
1 Claim. (Cl. 33—50)



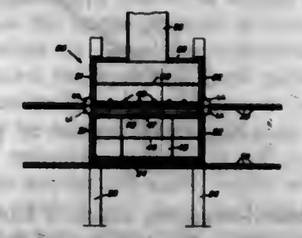
In a telescope sight mount for rifles, a base bar, a saddle fixed to each end of the bar, each saddle comprising an end portion extending transversely with respect to the bar, the portion having a recess in its lower face laterally offset from the bar to seat upon the rifle and being apertured to receive screws for fastening it to the rifle, a plate mounted on the bar, a peep sight, the plate

having an aperture in which said peep sight is movable up and down, a bar suspended from the plate and carrying the peep sight, and spring means urging said bar upwardly.

---

**2,773,311**
**OPTICAL MICROMETER**
Clarence J. Kettler, Stockbridge, Mass., assignor to General Electric Company, a corporation of New York
Application November 12, 1953, Serial No. 391,428
3 Claims. (Cl. 33—147)

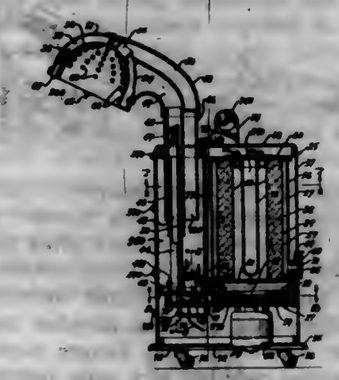
1. A measuring device comprising, in combination, a stationary base having a supporting surface; a movable member having an engaging surface facing said supporting surface of said stationary base and being mounted for movement toward and away from said supporting surface, said movable member being continuously biased toward said supporting surface for engaging an object to be measured on said supporting surface; a reticule having spaced markings and being attached to said movable member for movement therewith; a stationary optical system arranged with its optical axis passing through said reticule and being operative to magnify the spacing of the markings thereon; and moving means connected to said movable member for cyclically moving the same away from said supporting surface of said stationary base and permitting its biased return movement toward said supporting surface, said moving means including a lost motion connection permitting uniform pressure to be applied by said movable member to objects of different thickness.



---

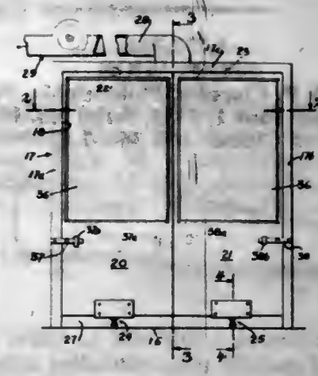
**2,773,312**
**APPARATUS FOR DRYING FABRICS**
Henry E. Peck, Fairport, N. Y.
Application April 1, 1953, Serial No. 346,192
14 Claims. (Cl. 34—46)

1. Apparatus for treating a fabric comprising a heating chamber having an entry port at one end and an exit port at its opposite end, a tenter frame for holding the fabric along its opposite lateral edges to maintain a fixed width and for conveying the fabric through said chamber from the entry port to the exit port, means for supplying super-heated steam to said chamber under greater than



atmospheric pressure at one side of said fabric and for sucking the steam from said chamber from the opposite side of said fabric as the fabric travels through said chamber, whereby to cause the steam to pass through the interstices of the fabric as the fabric travels through the chamber, and flexible sealing means positioned along both edges of both the entry and the exit ports to engage

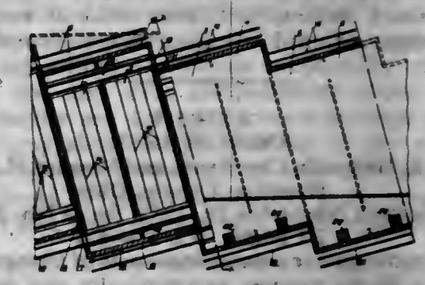
both sides of the fabric in direct contact therewith and both sides of the tenter frame directly as the tenter frame and the fabric travel through said ports, to exclude air from said chamber, said sealing means being yieldable to conform to the shape of the fabric and of the tenter frame thereby to provide tight seals around both the fabric and the tenter frame.



---

**2,773,313**
**HAIR DRYING APPARATUS**
Joseph H. O'Connor, Detroit, Mich., assignor, by direct and mesne assignments, to Harold J. Silver and Evelyn B. Silver, Dallas, Tex.
Application June 19, 1950, Serial No. 168,909
10 Claims. (Cl. 34—48)

8. A hair dryer comprising a helmet, means forming a chamber having desiccant therein, an air blower, conduit means connecting said helmet, said chamber, and said blower in series relationship in the order stated so as to form a closed recirculating air path, whereby air is sucked by said blower from said helmet through said chamber to said blower and is blown by said blower back to said helmet, said desiccant in said chamber acting to remove moisture from air passing through same and tending to heat said air because of latent heat of adsorption, means forming an ambient air bleed opening from the outside atmosphere into said recirculating air path at a point near the outlet side of said chamber and the intake side of said blower, to bleed ambient air into said recirculating air path at a point where said ambient air is blown to said helmet without first passing through said desiccant, thereby preventing said ambient air from being heated by said desiccant prior to reaching said helmet, a door movable with respect to said opening for regulating the effective size thereof, and means for maintaining said door in an open position during the progress of drying operations to admit ambient air to compensate for the effect of said latent heat of adsorption in heating the recirculated air.



**2,773,314**
**GARMENT DRYERS**
George K. Gauff, Great Neck, N. Y., assignor to New York Silicate Book Slate Co., Inc., New York, N. Y., a corporation of New York
Application May 5, 1955, Serial No. 506,281
9 Claims. (Cl. 34—91)

1. A garment dryer for use in schoolrooms and the like comprising an enclosure having a rectangular frontal opening whose lower edge is substantially at floor level, a panel normally positioned in the plane of said opening with its upper and at least one lateral margin in close relation with the upper and at least one lateral edge of the opening, said panel being pivoted at top and bottom so that it is adapted to rotate about its central vertical axis through at least 180° and, after having been rotated so that its own faces are reversed, to resume a position in which its upper and at least one lateral margin are in close relation with the upper and at least one lateral edge of the opening, securing means to hold the panel in each of said positions, a garment rack secured to one face of said panel, an opening for passage of air into said enclosure, at least one of the marginal edges of said opening being defined by said panel and the opening being positioned below the level of the garment rack for entry of air into the enclosure beneath the same, an air duct for removing air from the enclosure, said duct having its intake orifice positioned within the enclosure and at a level above the level of said garment rack, and means for propelling air in said duct in a direction away from said enclosure.

---

**2,773,315**
**METHOD AND DRYING KILN FOR DRYING LUMBER**
Carl Johan Liljeström, Stockholm, Sweden, assignor to AB Svenska Flaktfabriken, Stockholm, Sweden
Application July 21, 1953, Serial No. 369,336
Claims priority, application Finland July 26, 1952
4 Claims. (Cl. 34—209)

1. In a drying plant a series of generally rectangular drying chambers for drying elongated articles, means for circulating a drying medium through each chamber, an intake door in one side wall of each chamber adjacent the end wall thereof for longitudinally advancing the articles into said chamber to dispose them transversely thereof, means to laterally advance said articles through the length of said chamber, and a discharge door in the

opposite side wall of said chamber adjacent the other end wall thereof to longitudinally withdraw said articles from the chamber, adjacent chambers in said series having no communication with one another and being offset longitudinally to expose the intake door at the one end of one chamber and the discharge door at the other end of the adjacent member.

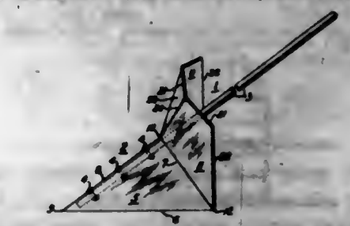
---

2,773,316
SPORT SHOE
Frank P. Clappier, Philadelphia, Pa.
Application June 1, 1953, Serial No. 358,877
1 Claim. (Cl. 36—2.5)

A sport shoe having a sole and an upper in combination with a rigid metallic plate extending along the length of the sole from the heel and terminating at a position about ¾ inch forward of the center of the ball of the foot, the sole forward of said position being flexible.

---

2,773,317
ARTICLES OF FOOTWEAR
Jens Boesen Helle, Vedbaek, near Copenhagen, Denmark
Application July 13, 1954, Serial No. 443,081
5 Claims. (Cl. 36—11.5)



1. An article of footwear comprising: a unitary outsole and foot retaining means thereon; said unitary outsole comprising a bottom surface, a top surface and side faces; said bottom surface being provided with ribs integral with said outsole and spaces between these ribs; said outsole being further provided with a number of recesses extending between said top surface and said bottom surface, and opening at said side faces; said foot retaining means including strap means for connecting with said outsole, each of said strap means having a terminal portion inserted in one of said recesses and fastened to said cutsole by means of a rivet; said rivet having an upper head and a lower head and penetrating said outsole from said top surface to said bottom surface thereof through the recess and through the terminal portion inserted therein, said lower head of each of said rivets being positioned in a space between two of said ribs.

---

2,773,318
SNOW PUSHER
Eugene E. Hemsath, Cincinnati, and Howard H. Hemsath, Hamilton County, Ohio
Application November 18, 1952, Serial No. 321,158
2 Claims. (Cl. 37—53)

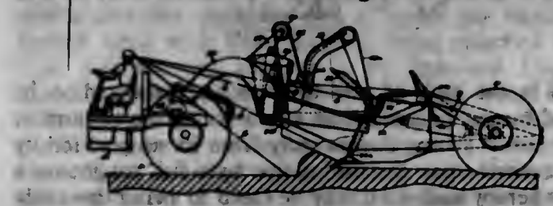
1. A snow pusher comprising a pair of triangular snow-engaging blades meeting symmetrically and perpendicularly in a common inclined dividing edge, there being a lead point on said dividing edge at the ground-engaging end thereof, each blade having a ground-engaging edge extending laterally and rearwardly from the lead point, each blade having a third edge inclined upwardly from the trailing end of the ground-engaging edge and extending to the end of the dividing edge remote from the lead point, a pair of wing flanges substantially perpendicular to the plane of the ground-engaging edges of the blades, each of said wing flanges extending upwardly from the trailing edge of one of said blades, a central flange plate disposed between the adjacent edges of said wing flanges and secured thereto, whereby a continuous upwardly projecting flange is formed extending between the rear

ends of the ground-engaging edges, a handle, a portion of said handle adjacent one end thereof being disposed in the inverted trough formed by said blades, beneath and extending parallel to the dividing edge, and securing means urging said handle toward said dividing edge, the blades and plates being adapted to vibrate when the lower edges of the blades are advanced over the surface to dislodge snow therefrom.

---

2,773,319
CONVEYOR LOADER HITCH
Raymond Q. Armington, Shaker Heights, Ohio, assignor, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Original application October 4, 1947, Serial No. 777,887. Divided and this application June 17, 1953, Serial No. 362,284
4 Claims. (Cl. 37—110)

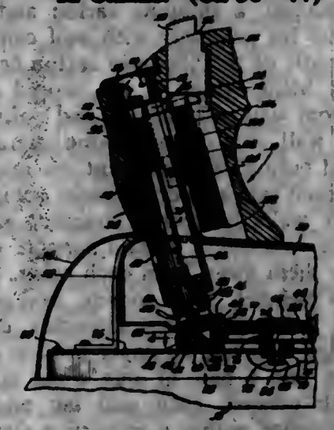
1. In apparatus of the class described, the combination of a drawbar member, rolling support means for supporting by a horizontally disposed pivot the forward end of said drawbar member, a frame member, rolling support means supporting said frame member, hanger members straddling said drawbar member and extending downwardly therefrom, said hanger members connecting said drawbar member at a point intermediate its fore and aft length to a forward portion of said frame member and being connected by a transversely extending horizontal pivot to one of said members, a cutting blade carried by said frame member at the forward end thereof ahead of the connection with said hanger members, and power means connected between said frame member and the rear end of said drawbar member a substantial distance aft of said hanger members for raising and lowering said drawbar member by substantial mechanical advantage by oscillating said frame member about its pivotal support on its rolling support means, the parts of said apparatus being oriented so that the operator has a clear view of the cutting action at said blade.



---

2,773,320
DIGGING AND CARRYING SCRAPER
Edward R. Fryer, Willoughby, Ohio, and William J. Adams, Santa Cruz, Calif., assignors, by mesne assignments, to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application May 14, 1952, Serial No. 287,772
7 Claims. (Cl. 37—126)

1. In a digging and carrying scraper, a bowl having an open front and having an ejector for dumping the



contents of said bowl, an apron for closing said open front, means for raising said bowl between lowered and elevated positions, means for raising said apron between positions closing and opening said open front, means for raising said ejector between a lowered retracted position and an elevated dumping position, each of said means including an interchangeable single acting hydraulic hoist power unit in operative connection therewith for performing the raising movement while the weight of the respective parts returns the apron or bowl or ejector to its lowered position when its respective hydraulic hoist power unit is de-activated, the hydraulic hoist power units being operable independently so that the apron or the bowl or the ejector may be moved without moving the other two last-mentioned movable scraper parts, each hydraulic hoist power unit having the same length working stroke, said means for raising said bowl including two of said hydraulic hoist power units with each operatively connected to a motion transmitting means movable in re-

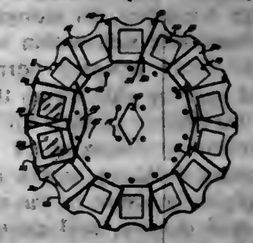
sponse thereto with the last-mentioned means connected to said bowl for raising it at full load a short distance with great force, said means for raising said apron including a motion transmitting means movable in response to its associated hydraulic hoist power unit and operatively connected to said apron for raising said apron at full load about twice the distance at about twice the speed of said bowl raising movement and exerting about one quarter the lifting force required to lift said bowl, said means for raising said ejector including a motion transmitting means movable in response to its associated hydraulic hoist power unit and operatively connected to said ejector for raising it at full load at a speed varying approximately inversely with the load and with a force varying approximately directly with the load being moved during ejection and for accelerating its movement as it moves over approximately the entire distance from the retracted position to the dumping position when its associated hydraulic hoist power unit moves at a constant rate.

---

2,773,321
WATER FEED FOR STEAM IRON
John R. Gemersall, Elgin, Ill., assignor to McGraw Electric Company, Elgin, Ill., a corporation of Delaware
Application May 25, 1953, Serial No. 357,601
12 Claims. (Cl. 38—77)

1. A steam iron including a sole plate having a steam generating chamber, a water inlet fitting in the top of said steam generating chamber, a water tank above said sole plate and spaced from said inlet fitting, a bracket engaging said tank only near the top thereof and supported on said sole plate for supporting said tank and minimizing the conduction of heat thereto, said tank having a water outlet fitting in the bottom thereof horizontally displaced from said inlet fitting and spaced from said sole plate, whereby to minimize the conduction of heat from said sole plate to said tank, and a water conduit connecting said two fittings.

---

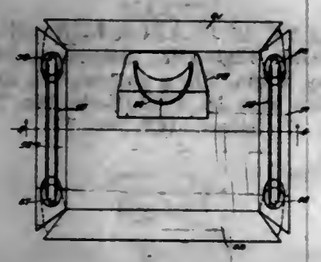


2,773,322
WATER VALVE ACTUATOR FOR STEAM IRON
John R. Gemersall, Elgin, Ill., assignor to McGraw Electric Company, Elgin, Ill., a corporation of Delaware
Application May 25, 1953, Serial No. 357,135
7 Claims. (Cl. 38—77)

1. In a water-valve control mechanism for a steam iron including a sole plate, a steam-generating chamber, water supply means, means interconnecting said water supply means and said steam-generating chamber including a valve for controlling the flow of water from said supply means to said steam generating chamber, said valve including a reciprocable valve stem and a seat therefor, in combination, an actuator for said valve stem, means for supporting and guiding said actuator for movement longitudinal of said stem, a connection between said actuator and said valve stem including a spring for urging said stem against said seat and for permitting motion of said actuator when said stem is seated and including also an abutment by which said actuator pulls said valve stem off said seat, and a second spring operatively connected to said actuator for moving said actuator in the direction that carries said valve stem off said seat.

---

2,773,323
DISC FOR FILM SLIDES
Sam Gerwitz, Oshkosh, Wis.
Application May 12, 1951, Serial No. 226,080
1 Claim. (Cl. 40—70)



A composite circular disc for film slides comprising a pair of plates fastened together and having opposed rectangular depressions to provide a plurality of edge-accessible flat film slide compartments about its periphery whereby any one compartment overlaps into the next adjoining slide compartment up to the edges of registering apertures formed in said plates, the said plates being apertured in registry to conform to the transparent portions of film slides to be held in said compartments.

---

2,773,324
FRAME TYPE DISPLAY DEVICE
Fred Druseck, Jr., Chicago, Ill., assignor to Chicago Cardboard Company, a corporation of Illinois
Application September 27, 1952, Serial No. 311,906
9 Claims. (Cl. 40—155)

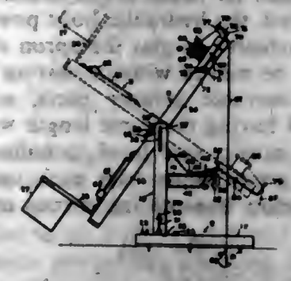
1. A collapsible display device provided with an integral frame comprising: a display portion having straight

margins; a frame piece hinged to each margin of said display portion for movement between assembled positions in which they are angularly disposed with respect to the plane of the display portion and collapsed positions substantially in said plane; a primary assembly strip hinged on each alternate frame piece and lying therebehind; secondary assembly strips hinged on the intervening frame pieces between said primary assembly strips and having their end portions overlapping those of the

primary assembly strips; and by elastic means secured to the ends of said primary assembly strips and tensioned between opposite primary assembly strips, to draw said strips toward one another, so that movement of the primary assembly strips toward one another moves the secondary assembly strips toward one another and the frame pieces to their assembled angularly disposed positions, said elastic means being unsecured to said secondary strips and having portions underlying said secondary assembly strips.

---

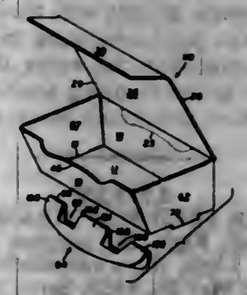
2,773,325
MAGAZINE AND CARTRIDGE CONTAINER ASSEMBLY
John L. Hill, Houston, Tex.
Application June 26, 1953, Serial No. 364,301
7 Claims. (Cl. 42—50)



2. In a cartridge container, an elongate tube, at least one row of cartridges disposed within said tube, the individual cartridges being oriented normal to the tube axis and arranged side by side along the length of the tube, a pressure disruptable closure for one end of said tube normally preventing discharge of cartridges therefrom, a spring-loaded follower within said tube at the other end for applying pressure to the row of cartridges and thus against said closure, said closure being of sufficient strength to resist the normal pressure imposed thereon by said cartridge row under the influence of said follower, and means whereby a temporary pressure in excess of said spring pressure can be applied to said cartridge row to rupture said closure and permit the discharge of cartridges from said tube.

---

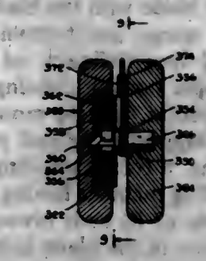
2,773,326
FOLDABLE TILT-UP
Warren D. Calvert, Clark, S. Dak.
Application September 9, 1953, Serial No. 379,220
3 Claims. (Cl. 43—16)



3. In a fishing device, a base, a standard rising from said base, a tilt arm having pivotable supporting means intermediate its ends on the upper end of said standard, said tilt arm having one end upwardly inclined and the other end downwardly inclined and said supporting means being displaceable toward said other end so that the tilt arm is overbalanced in an inclined position, a reel on the one end of the tilt arm having a fishing line wound thereon and terminating in a fishhook, a bracket on said standard mounted below the upper end of the standard and beneath the one end of the tilt arm, an upwardly spring pressed yoke pivoted on said bracket adapted to swing upwardly toward the standard when released from another tensioned position, pivoted trigger means on said bracket adapted to engage said yoke to hold the yoke in a tensioned position, said trigger means including a retaining trigger hook

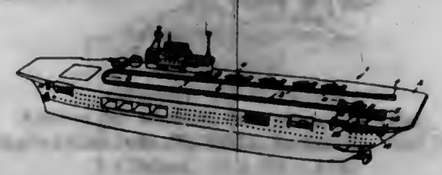
located in the path of said tilt arm and arranged to be engaged by and released from said yoke by the tilt arm as the tilt arm is swung downwardly from its set position by a pull exerted upon the fishing line by a fish caught on a hook, whereby said yoke may be freed to swing upwardly and impart a sufficient upward movement of the tilt arm to tighten the fishing line and set the hook in the fish, and a longitudinally slidable counterbalancing weight on said tilt arm adjacent to the other end of the arm for predetermining the overbalance of the tilt arm.

---



2,773,327
CRADLE-TYPE CARTON FOR DOLLS
Frank McCormick, Nyack, N. Y., assignor to Federal Carton Corporation, North Bergen, N. J., a corporation of New York
Application November 26, 1954, Serial No. 471,214
11 Claims. (Cl. 46—15)

1. In combination, a shipping carton and a pair of support elements for assembly with said carton to convert it into a cradle or the like, said carton being formed from a unitary blank which is cut, scored and folded to define a bottom wall and side and end walls connected to said bottom wall, said carton having laterally extending slots in said bottom wall adjacent the respective end edges thereof, each said support element comprising registering support walls hingedly connected at their top edges, the hinge connection of said support walls being such as to urge them away from each other, the bottom of said support element being convex, said support element having a pair of cut-outs extending downwardly from its top edge to divide its upper portion into a central tab portion and a pair of side wings spaced from said central tab portion, each said tab portion being frictionally positioned within a respective slot with said support element extending laterally, the lower edges of said cut-outs abutting the bottom edge of said end wall, the proximate side edges of said wings respectively frictionally abutting the side edges of said end wall.



2,773,328
GRAVITY OPERATED REVERSING WHIRLING TOY
Alexander Fraenkel and Auguste Rietsch, New York, N. Y.
Application February 20, 1953, Serial No. 338,108
5 Claims. (Cl. 46—61)

1. In a gravity operated whirling toy, the combination of: a rotatable body element including a pair of spaced disk-like members and a center pin rigidly connecting same with each other, a string attached to said body element and adapted to be unwound from and wound on said center pin whereby said body element will unwind downwardly on said string by gravitation and climb thereon by rewinding through its own rotational momentum, a helical spring wound around said center pin, and means at one end of said helical spring for engagement with said string, the other end of said helical spring being in connection with said center pin whereby said helical spring is tensioned during the unwinding of said body element so as to create a force acting on said body element upon the unwinding thereof for assisting in the creation of a rotational momentum for the subsequent climbing of the body element on said string.

---

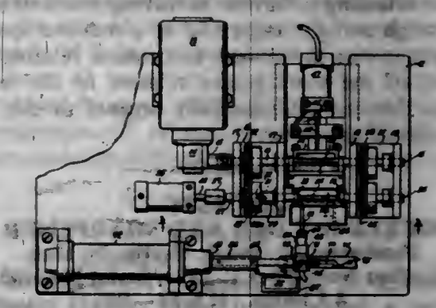
2,773,329
TOY AEROPLANE LAUNCHING DEVICES
Joseph Sherri, Toronto, Ontario, Canada
Application November 9, 1953, Serial No. 391,035
1 Claim. (Cl. 46—81)

In apparatus for launching a toy aeroplane from a flanged track, said track being inclined upwardly to one end thereof from a point near said one end, a projectile simulating a toy aeroplane having a flanged runner slidable on said track, said flanged runner loosely embracing the flanges of said track, said runner having a vertical rear face and an upwardly inclined lower face, a fixed pin positioned on a lower plane than, and to one side of, said track and extending parallel to said track, an impeller having a body part movable lengthwise of and rotatable on said pin, a pair of arms connected to said body and extending upwardly at the side of said body adjacent to said track, fingers carried by said arms spaced from each other lengthwise of said impeller and extending laterally into the path of said runner and receiving said runner therebetween when the projectile is moved manually along said track, a coil spring encircling said pin rearwardly of said impeller body, stop means restraining movement of said spring in a direction rearwardly of said impeller body, a detent, and a handle projecting laterally from said impeller body at the side thereof removed from said arms, said handle being engageable with said detent to compress said coil spring between said handle and said stop means and on release from said detent freeing said coil spring whereby same will propel said impeller forwardly and cause said rearmost finger to forcefully impinge the vertical face of said runner and cause said projectile to be expelled from said track.

---

2,773,330
SOIL CONDITIONER
Richard C. Erwin, Mountain View, Calif., assignor to Stauffer Chemical Company, a corporation of Delaware
No Drawing. Application October 27, 1954, Serial No. 465,149
7 Claims. (Cl. 47—58)

3. The method of treating soil comprising applying to the soil a soil treating agent containing from about 10 to 50 parts of ferric sulfate and from 50 to 90 parts of calcium carbonate, all parts being by weight.



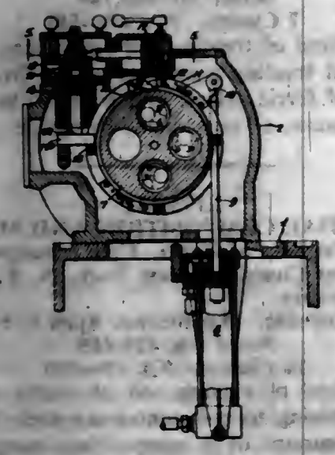
---

2,773,331
HERBICIDAL COMPOSITION AND METHOD
William J. Hughes, Modesto, Calif., assignor to Shell Development Company, New York, N. Y., a corporation of Delaware
No Drawing. Application April 1, 1954, Serial No. 420,465
14 Claims. (Cl. 47—58)

11. A method of ridding soil of viable seeds which comprises applying to soil containing such viable seeds an effective amount of a composition comprising allyl alcohol and 1-chloro-3-bromo-1-propene having a weight ratio of allyl alcohol to 1-chloro-3-bromo-1-propene of from about 1:5 to about 2:1.

---

2,773,332
MACHINE AND METHOD FOR CUTTING HELICAL FILM RESISTORS
A. Sander Buchman and Howard B. Erlick, Philadelphia, Pa., assignors to Shallcross Manufacturing Company, Collingdale, Pa.
Application October 30, 1953, Serial No. 389,414
3 Claims. (Cl. 51—15)



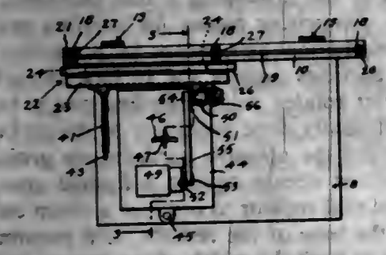
1. Apparatus for processing a film deposited ceramic-base resistor comprising means for rotating said resistor around its longitudinal axis, means for projecting a stream of abrasive particles against the surface of said resistor while the latter rotates, said projecting means being positioned in sufficiently close proximity to the surface of the resistor whereby the abrasive particles are projected in a restricted narrow stream against a limited area only on the surface of said resistor to produce a sharp cut through said film to the base of the resistor, said proximity being controlled as to limit the width of the stream of abrasives to a dimension substantially equivalent to the desired width of the path to be cut through the film, means for moving said projecting means in the direction of said axis at a controlled rate of speed whereby a helical path in said film is completely removed from said resistor down to the ceramic base thereof, means for continually measuring the resistance of said resistor as the helical path is being cut in said film, and means actuated by said measuring means for stopping the flow of said abrasive particles when a predetermined resistance is achieved.

2,773,333

## MACHINE TOOL, ESPECIALLY GRINDING MACHINES FOR MACHINING ROTATING WORK PIECES

Lennart Johansson, Goteborg, Sweden, assignor to Aktiebolaget Svenska Kullagerfabriken, Goteborg, Sweden, a corporation of Sweden

Application September 25, 1953, Serial No. 382,413
Claims priority, application Sweden September 29, 1952
4 Claims. (Cl. 51—53)



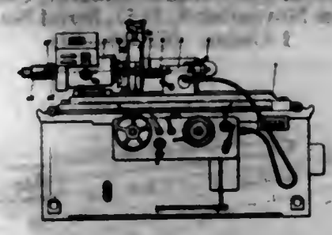
1. A machine tool, especially a grinding machine for working on rotating work pieces, a carriage for work spindles comprising a rotatable drum, a plurality of work spindles mounted in said drum, a tool carriage comprising a slide reciprocable in a direction parallel to the rotational axis of the drum towards and from the work spindle carriage, a plurality of tool holders mounted on the slide in positions fixed relative to each other for simultaneously working on a plurality of work pieces carried on the respective work spindles, means for revolving the drum stepwise to bring the work pieces in turn into working position relative to each of the tools, and means for effecting a further revolving movement of the drum through a slight angle and at a reduced speed after each said stepwise movement to cause a relative feeding movement of the work pieces relative to the respective tools in a direction substantially normal to the reciprocatory paths of the latter.

2,773,334

## SICKLE HOLDER AND SHARPENER

Ferdinand W. Busch, Berlin, N. Dak.

Application November 1, 1954, Serial No. 465,789
4 Claims. (Cl. 51—96)



1. A sickle blade sharpener of the character described comprising a substantially flat horizontally disposed base member, an elongated support member resting on said base member adjacent an edge thereof, hinge means connecting said support member to the base member for swinging movement of the support member outwardly and downwardly with respect to the base member, an elongated rod, means supporting said rod above said support member and longitudinally thereof, an elongated blade holder, means secured to said blade holder and slidably engaging said rod for mounting said blade holder for movement in a direction longitudinally thereof and lengthwise of the support member, said blade holder being normally disposed in substantially a vertical plane in an operative position therof and having a bottom portion provided with downwardly opening clamping means adapted to detachably engage the back edge portion of a sickle blade to support the blade with the blade teeth depending from said clamping means and bottom portion and with said blade disposed longitudinally of the holder, said holder having an upper portion defining a handle extending longitudinally thereof, a plate mounted on said base member, a bearing supported by said plate, a shaft journalled in said bearing, a rotary grinding member fixed to said shaft, said grinding member having a periphery tapering from intermediate of its ends toward each end thereof, said bottom portion of the blade holder being disposed between the rod and grinding member for supporting the blade between the holder and the grinding member, and a motor supported by said plate and connected to said shaft for revolving the shaft and the grinding member, said blade holder being manually swingable relative to the supporting member for swinging the blade teeth upwardly and into engagement with the grinding member to be sharpened thereby and being slidably movable relative to the supporting member for positioning the different blade teeth in positions to be engaged by the grinding wheel.

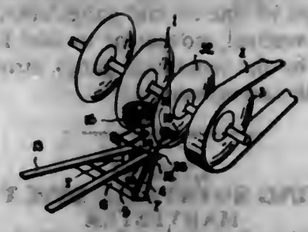
2,773,335

## CENTERING ARRANGEMENT FOR MACHINE TOOLS

Helmut Crämer, Stuttgart-Degerloch, and Robert Meyer, Stuttgart-Rohr, Germany, assignors to Firma Fortuna-Werke Spezialmaschinenfabrik A.-G., Stuttgart-Bad Cannstatt, Germany

Application January 26, 1954, Serial No. 406,235
Claims priority, application Germany January 28, 1953
17 Claims. (Cl. 51—165)

1. In a centering arrangement for rotary machine tools, in combination, supporting means; center means having an extreme projecting point adapted to engage a center hole in a workpiece, said center means being mounted in said supporting means and being movable in axial direction; means urging said center means in one axial direction into an extreme projecting position adapted to project toward a workpiece; abutment means mounted on said supporting means located spaced in the opposite axial direction from said extreme projecting point of said center means in an axial direction opposite said one axial direction and adapted to engage in a predetermined position a workpiece engaging said center means whereby said center means is located in a control position moved from said extreme projecting position in the opposite axial direction; manually operable stop means movable between an inoperative position and a blocking position for blocking further movement of said center means in said opposite axial direction; and shifting means engaging said center means and said stop means for shifting said center means relative to said supporting means and said abutment means in said one axial direction for a predetermined distance so that said workpiece is spaced from said abutment means; and operating means for actuating said holding means and said shifting means.

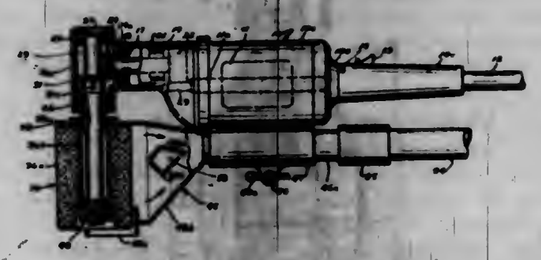


2,773,336

## DISC GRINDERS

Adolphe H. A. Lesher, Winnipeg, Manitoba, Canada

Application January 25, 1954, Serial No. 405,960
1 Claim. (Cl. 51—173)



A friction driven sharpening device for cultivating discs, comprising a substantially triangular base, an upstanding T-shaped frame provided on said base and including a cross member having each end portion thereof provided with a set of three apertures, a pair of angle brackets having main arm portions overlying in spaced relation the apex portion of said base and angulated arm portions abutting said cross member, at least two fastening elements provided at spaced points on the angulated arm portion of each bracket and receivable selectively in each set of said apertures, a handle secured to said frame, an abrasive wheel rotatably mounted on the main arm portion of one of said brackets, a lever pivoted intermediate the ends thereof to the main arm portion of the other bracket and movable toward and away from said handle, and a disc-engaging castor wheel rotatably mounted on said lever adjacent said abrasive wheel, said apertures in each set being disposed in the pattern of a right-angled isosceles triangle and the spacing of said fastening elements on each bracket corresponding to the length of each of two equal sides the triangular pattern, whereby said brackets may be fastened interchangeably to the opposite end portions of said cross member with the axis of said abrasive wheel disposed selectively in horizontal and vertical planes.

## GRINDING DEVICE

Arturo De Marchi, Minneapolis, Minn.

Application July 26, 1954, Serial No. 445,781
3 Claims. (Cl. 51—176)

1. A portable grinding device for polishing a terrazzo surface having in combination, a housing, an elongated cylindrical grinding member carried at one end of said housing and extending in a direction at right angles to the axis thereof, a conduit in which suction is created having a portion clamped to said housing, a hood connected to said conduit adjacent said housing and substantially V-shaped in vertical longitudinal section and having sides diverging to a width substantially the width of said grinding member and then having portions extending in the direction of said grinding member at right angles to the axis thereof, said hood extending above and below said grinding member for some distance thereacross, a baffle member substantially diamond-shaped in form positioned centrally transversely in said hood and extending the full height thereof, said baffle member being adjacent said grinding member in operating position and having its sides remote from said grinding member parallel to the diverging sides of said hood and forming channels therewith, whereby said hood withdraws dust the full width of said grinding member and said channels direct indrawn currents of air to be particularly intensified at the end portions of said grinding member.

## ABRADING ARTICLE

Willard K. Carter, Columbus, Ohio

Application April 5, 1954, Serial No. 420,897
5 Claims. (Cl. 51—204)

1. An abrading article formed from a fragile multicellular ceramic structure coated with a compound comprising a stabilized dispersion of a copolymer of styrene and butadiene.

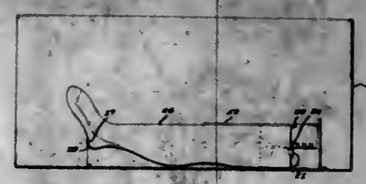
## PROCESS FOR THE SURFACE TREATMENT OF LIGHT ALLOY COMPONENTS, MORE PARTICULARLY FOR THE ABRASIVE BLAST TREATMENT OF LIGHT ALLOY CASTINGS

Fritz Nikolaus Bischoff, Schaffhausen, and Hans Paul Häberlin, Neuhausen am Rheinfall, Switzerland, assignors to Georg Fischer Aktiengesellschaft, Schaffhausen, Switzerland, a Swiss company

No Drawing. Application July 23, 1952, Serial No. 300,528
Claims priority, application Switzerland July 24, 1951
3 Claims. (Cl. 51—282)



1. In the process of blast-treating shapes, castings and the like; the step of directing against the surface of the casting made of light weight metal with an atomic weight ranging from 24 to 27 shots, grits, slugs and like particles obtained from an alloy of light weight metal consisting predominantly of aluminum in an amount not less than approximately 80% of the total weight of said alloy.

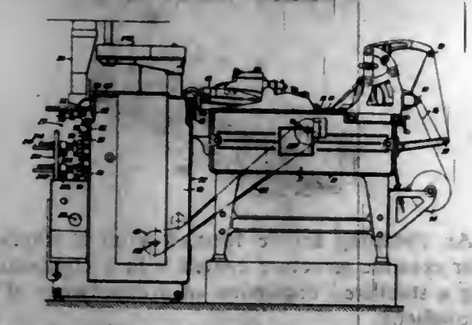
## HOSIERY PACKAGING

Charles E. McCarthy, Palisades Park, N. J., assignor to Chadbourn Hosiery Mills, Incorporated, a corporation of North Carolina

Application December 8, 1953, Serial No. 396,836
2 Claims. (Cl. 53—21)



1. A method of packaging hosiery comprising the steps of providing a fixed reference point and a locating means spaced therefrom at a maximum hosiery length, positioning a packaging card to extend from said locating means toward said reference point in a length sufficient to include standard length variations below said maximum length, placing the foot portion of a pair of hose at said reference point and extending said hose therefrom to dispose the top portion thereof in overlying relation at one face of said card, attaching the extended top portion of said hose to said card at the

overlying position thereof, folding the extending lower portion of said hose at the opposite face of said card and enclosing the folded hose and card in a package with indicia arranged in relation to the length of said card for indicating the length of said hose from the attached overlying position thereof.
